Several booksellers of France, Germany, and Belgium, have, however, thought that the creation of a book being the result of a combination of different industrial branches—such as wood-engraving, metal-engraving, colouring, the choice of types, and of the various kinds of paper, &c.,—the bookseller ought to be looked upon as the partial creator of these industrial products, the first idea of which he had in many instances conceived.

In awarding the Prize Medal, the Jury have, in each branch, observed the general principle of acknowledging the various kinds of excellence to be met with in each article under consideration, without entering into the question of relative merit.

\* M. Didot, a Greek scholar, and an eminent typographer, engraver and typefounder, printer to the Institute of France, and paper-manufacturer, having been appointed member of the Jury, his firm (of which he is the head partner) was excluded from competition. The Jury cannot, however, abstain from expressing their high appreciation of the important services, zeal, impartiality, and talent displayed by M. Didot, both as Joint Reporter and Jurymen.

Some articles, though having no claims either to a Prize Medal or an Honourable Mention, contained, nevertheless, some merit, which justified the Jury in noticing them in their Report. They do not profess to express an opinion upon every article exhibited, notwithstanding the care they have taken in making a critical examination of the whole; thus their Report has reference to the general merits of the goods exhibited, as illustrative of the present state of the Paper Manufacture, Printing, and Book-binding, as pursued in various countries, and the contributions of any individual Exhibitor are neither commented upon, nor is any allusion made to them, except in illustration of the Report.

In the appreciation of the articles of this Class, the products of which deeply interest all grades of society—contribute to their moral, intellectual, and social civilization, and give activity and employment to so many minds and hands—it would have been gratifying to the Jury, had they been able to draw a faithful picture of the actual state of all those branches of industry which have occupied the most ingenious inventors, to trace their gradual development, and to indicate their probable future growth. The Jury feel how imperfectly they have succeeded in attaining this end; they have, however, given a rapid historical sketch of the origin and progress of Printing, of Paper Manufacturing, &c., in order to facilitate a comparison between the past and the present, and to enable the reader in some degree to judge of the real extent of those branches of industry, in various countries, as represented at the Great Exhibition.

The Reporters express their thanks to their Chairman, M. VAN DE Weyer, for his assistance and contributions in the drawing up of the Report; also to their colleague, Mr. HENRY STEVENS, for the information he has given on the state of Type-founding and Paper Manufacture in the United States, as well as for his article on "Printing for the Use of the Blind."

The number of exhibitors of all nations in this Class is 559, of which 212 belong to Great Britain; 124 to France; 1 to Algiers; 24 to the Zollverein States, including Prussia, Baden, and the United States of Northern Germany; 23 to the Grand Duchy of Baden, and the West Provinces of Prussia and Electoral Hesse; 19 to Bavaria; 10 to Saxony; 7 to Wurtemberg; 8 to Frankfort-upon-the-Maine; 18 to the Grand Duchy of Hesse; 1 to Nassau; 3 to Hamburg; 1 to Hanover; 6 to the Netherlands; 1 to Persia; 1 to Smyrna; 2 to Portugal; 2 to Rome; 5 to Russia; 2 to Sardinia; 1 to Spain; 5 to Switzerland; 2 to Tuscany; 3 to India; 2 to Malta; 5 to Canada; 1 to New South Wales; 1 to Van Diemen's Land; 23 to America; 19 to Austria; 17 to Belgium; 3 to China; 2 to Denmark; 2 to Sweden; and 3 to Egypt.

The Jury, in conclusion, express their hope that the union of all nations, evidenced by the Exhibition of 1851, may hasten the peaceful solution of a question which concerns at once the rights of justice, of literature, of the sciences, and of typography. Property, the unalterable basis of society, can never be less sacred in works of genius than in material concerns. Printers and booksellers, whose complaints unite with those of artists and literary men, have shown that the unrestrained reprinting of works, without regard to moral considerations, is generally attended, in every quarter, with greater inconvenience than advantage. The recognition of literary property within proper limits will give more intellectual life, and more creative imagination to countries in which the reprinting of foreign works now stifles the development of native literature and science.

The Custom-houses, now obliged to establish a search, frequently hostile, will relinquish the impediments to commerce and literature, and works will no longer be reprinted in haste, replete with errors, or mutilated according to the will of speculators, and in emulation of each other.

Lastly, the certainty of a wider market will be an encouragement to writers of talent, and to publishers, who are frequently prevented from commencing great undertakings by the fear of seeing their work immediately pirated. Universal co-operation is indispensably necessary to insure the success of great literary and scientific

enterprises, which could not fail to flourish in a higher degree if the rights in literary property were recognized.

### I. PRINTING.\*

After an interval of four centuries, the date of the Great Exhibition of the world's industry is coincident with the anniversary of that of the invention of printing. It seems as if all nations were assembled in the capital of England to celebrate the centennial birthday of the Press—the most powerful instrument of their civilization. It is by the aid of printing that different nations have imparted to each other their thoughts and their feelings, and have received in some degree a combined existence. Without this marvellous bond, they would have been left to the ignorance and prejudices which foster national warfare, and could never have presented this admirable display of universal harmony and of generous emulation.

When we consider the great costliness of manuscripts at a former period, the difficulty of procuring them, and all the benefits of which society was devoid before the discovery of printing, every friend of study and of exalted intellectual speculations should deem himself fortunate in living at a period when so many stores of instruction are placed within the reach of all.

In every age, and in all countries, printing denotes the state of civilization, of which books are the reflex, and the history of the human mind is written in the progress of bibliography. Thus the first printed books of Germany were almost all devoted to theology and scholastic philosophy, while at Paris ancient literature occupied an equal rank with theology; thus also at Rome, where the remembrance of ancient literature maintained a still stronger empire, printing under the guidance of the Bishops of Aleria and Teramo, principally reproduced the master-pieces of classic times. In France, however, under the influence of the chivalrous reign of Francis I., a great number of works upon chivalry soon appeared, and the desire of becoming acquainted with narratives so much in conformity with the prevailing taste, was one cause of the introduction of printing into England. Of the sixty-two works printed in London by Caxton, those upon theology do not amount to ten, the remainder being devoted to chivalry, to history more or less romantic, to literature, and to manners and customs. Without expatiating upon this subject, we will confine ourselves to observing that at the period when the Pope founded at Rome the celebrated printing-office for the "Propagation of the Faith," there was no corresponding activity on the subject in London; and that at the present day, whilst the great printing establishment of the "Propaganda" remains inactive, England every year sends forth to the world a million of Bibles and New Testaments.

Soon after its first origin, the art of printing had attained a great degree of perfection, and it was not till the second half of the last century, that owing to the efforts of Ibarra, in Spain; of Baskerville and of Bulmer, in England; of the Foulises and the Ruddimans, in Scotland; of Bodoni, in Italy; and of the Didot family, in Paris, any real progress can be pointed out. The types were better cut and better cast, the ink as good as that of the earliest printers, the paper was improved in its make, and the press-work more uniform.

At that time the greatest admiration and astonishment

\* "I participate in the encomiums bestowed by all former eulogists on this transcendent art, which may justly be considered as the nurse and preserver of every species of knowledge; and while I look into history for an examination of the benefit which mankind has already derived from it, I feel equal, or even still more pleasure in anticipating that which it is yet capable of effecting, when, by being perfectly unfettered all over the globe, it will give rise to, and promote a system of universal education, and when, as a certain consequence of that education, all societies will direct their strenuous efforts towards bringing into complete operation that divine morality which has for its basis this simple but sublime maxim, 'Do unto another that which you would wish another should do unto you.'"  
—On the Art of Printing, by the late Charles, third Earl Stanhope.

were created by the rapidity with which at each action of the lever, moved by the hand of the workman, all the pages which a whole sheet of paper was capable of containing, were imprinted at a single stroke; but this rapidity, which enabled a workman to produce in one day more than a thousand transcribers could write, could not long suffice to supply the constantly-increasing demands caused by the march of intellect.

About the beginning of the present century, Charles, the third Earl Stanhope,\* by the invention of the press which bears his name, and of a new process of stereotyping, more simple and more economical, had made a great improvement in the typographical art. Subsequently Messrs. Bauer and Koenig, aided by the genius and knowledge of English engineers, and by the intelligence and perseverance of Messrs. Bensley and Walter, applied steam power to a new system, which created a revolution in the art of printing. In lieu of the platten, which the workman's arm slowly brought down upon the types, two cylinders printed with rapidity both sides of the sheet, whatever its size might be. In November 1814, by means of this machine, which was subsequently much simplified, the "Times" newspaper was printed with a rapidity which surpassed Guttenberg's press even more than the latter did the hand of the transcribers. It might have seemed that the rapidity of production in printing could proceed no further; but after having been repeatedly altered in its form, the printing machine appears before us now in an entirely novel shape, and we might believe on seeing the "Times" newspaper printed

\* Mr. Stower remarks, "That the common press is constructed on the true principles of mechanism. It does not, however (he allows), produce an adequate impression from heavy works in small letter without great labour and attention. It was, therefore, a great acquisition to gain an accession of power with, at the same time, a diminution of labour."

"This valuable acquisition in the art of printing owes its invention to that enlightened and patriotic statesman, Earl Stanhope. The iron press, invented by this nobleman, is capable of ten times the force of the common press, with, perhaps, a tenth of the labour. In working upon this press nothing is left to the judgment of the pressman but the beating."

The Stanhope principle has been applied in all succeeding improvements of the common press, whether of iron or wood.

Mr. Tilloch having given up the prosecution of the art of stereotyping, Mr. Wilson, a printer of respectability in London, engaged with Earl Stanhope for the purpose of bringing it to perfection, and eventually to establish it in this country. His Lordship, it is said, received his instructions from Mr. Tilloch, and had afterwards the personal attendance of Mr. Foulis for many months, at his seat at Chevening, where his Lordship was initiated in the practical part of the operation.

After two years' application, Mr. Wilson announced to the public, that the genius and perseverance of Earl Stanhope, whom he styles "the Right Honourable Inventor," had overcome every difficulty, and that, accordingly, the various processes of the stereotype art had been so admirably contrived, combining the most beautiful simplicity with the most desirable economy, the *ne plus ultra* of perfection with that of cheapness, as to yield the best encouragement to the public for looking forward to the happy period when an application of this valuable art to the manufacture of books would be the means of reducing the prices of all standard works at least thirty, and, in many cases, fifty per cent.

In January, 1804, the stereotype art (with the approbation of Lord Stanhope) was offered by Mr. Wilson to the University of Cambridge, for their adoption and use in the printing of Bibles, Testaments, and Prayer-Books, upon certain terms and conditions highly advantageous to Mr. Wilson; for, with his Lordship's characteristic generosity, Earl Stanhope uniformly declined to accept even the reimbursement of any part of the money by him expended in the prosecution of this ingenious art. Some differences, however, arising between Mr. Wilson and the officials of the University, the contract was dissolved, and Mr. Wilson published his case in a stereotyped pamphlet, entitled, "Arbitration between the University of Cambridge and Andrew Wilson."

by Applegath's new system, that the highest degree of speed had been attained, did not experience prevent mankind from assigning a limit to the perfectibility of human inventions, and to the inscrutable designs of Providence.

Mr. Koenig's machines, patented in 1814, were far too complicated and expensive, and the inking too imperfect, for general adoption. They were superseded by Mr. Edward Cowper's machine, which he invented and patented in 1816. Almost all the large editions of modern works are printed by Cowper's machines, and the influence they have had on the publication of books of all kinds is far beyond any expectation entertained at the time the machine was invented. After it had been in use some time, it was stated in Court, by an eminent lawyer (now a noble Lord), that, "if it had not been for Mr. Cowper's machine, it would have been impossible to supply the demand for books;" this is not correct, for at that time the hand-press *did* supply the demand: but the striking and important fact is, that the machine created a demand, and called into existence books which, but for it, would scarcely have been thought of. As the machine-work from type and wood-cuts was far better than the ordinary printing of the day, booksellers were induced to print extensive editions, because they saw the machine could accomplish all they required. One of the first booksellers who availed himself of this power was Mr. Charles Knight, who projected the "Penny Magazine," on a hint from Mr. M. D. Hill, Queen's Counsel. Each number, published weekly, consisted of eight pages of letterpress, illustrated with good wood-engravings. The public was astonished at the cheapness and good quality of the work, but it was its immense sale which rendered it profitable; for some years it amounted to 180,000 copies weekly. Mr. Knight, whose services in the cause of educational literature entitle him to the highest praise, expended 5,000*l.* a-year in woodcuts for this work. The Cowper machine has been the cause of the many pictorial illustrations which characterize so large a portion of modern publications. The "Saturday Magazine," "Chambers' Journal," the "Magasin Pittoresque," in France, and numerous others, owe their existence to this printing machine. The principal of *cheap editions and large sales* soon extended to establish works of a higher value. A remarkable instance of this was the edition of Sir Walter Scott's works, with notes, edited by himself: instead of the old price of 10*s.*, they were sold at 4*s.* a volume, and the demand created by this reduction of price was so great that, although the printer had a strong prejudice against machines, he was compelled to have them, the presses of his large establishment proving totally unable to perform the work, which amounted to upwards of 1,000 volumes per day for about two years. The Universities of Cambridge and Oxford have adopted Mr. Cowper's machines for printing vast numbers of Bibles, Prayer-books, &c. &c. A Bible, which formerly cost 3*s.*, may now be had for 1*s.* Mr. Cowper recommended the Religious Tract Society to put aside their coarse woodcuts, to have superior wood engravings, and to print them with his machine. The Society adopted these suggestions, and the result is, that by sending forth well-printed books, it could now support itself by their sale, without any aid from subscriptions.

As to newspapers, "THE TIMES," for instance, prints about *thirty-five thousand* copies every day, and as this newspaper is of a very large size, often with a supplement, the aggregate amount is more than thirty acres of printed surface per day—a quantity that could not possibly have been effected by hand-presses. At the "Times" office there are four machines, invented by Cowper and Applegath, printing from 4,500 to 5,000 impressions per hour; and two machines, lately invented by Mr. Applegath, printing *Ten thousand copies* per hour—a hand-press producing only 300 impressions per hour. The great point obtained in these machines is the perfect distribution of the ink, and the power of causing the type to pass under the inking-rollers twice for newspaper work, or from four to eight times for book-work, thus insuring the type being well inked. The effect was so striking, as to induce Mr. Cowper to apply

the inking-roller\* and table to the common press, and this method has entirely superseded the old printing balls, and completely abolished the imperfect inking, technically called "monks and friars," so frequently seen in books printed by the old system. The effect of Mr. Cowper's ingenious invention is, that books are well, cheaply, and quickly printed, an abundance of illustrations introduced, and the quality of printing improved all over the world; thus rendering literature accessible to millions.

#### PRINTING—AUSTRIA.

Printing, invented at Strasburg and at Mayence, and patronized by the Emperor Maximilian, who obtained masterpieces† from it at its very commencement, appears in this Exhibition with a degree of splendour which has caused general surprise. No less encouraged in our day by its present sovereign, the Imperial Printing-office of Austria has proved itself equal to its duties, and has accelerated the progress of the art by numerous experiments of all kinds. Xylography, engraving, type-founding, stereotyping whether by plaster moulds or by means of gutta percha and the galvanoplastic process, electrometallurgy, by which fossil fishes and animals buried in the antediluvian era are reproduced upon paper; galvanography, galvanotype, chymitype, all those new applications of art and science which dimly foreshadow an unknown future, are represented here; and lithography, that new sister of typography, also appears, with the new adjuncts of chromotypy and chromo-lithography.

The beautiful and rich collection of Oriental types, of which we have counted more than a hundred different sorts, as well engraved as they are well cast, proves that in Austria learning is not less encouraged than the arts.

By the side of so many objects relating to typography, we must admire the typographic plates, each measuring 540 square inches, formed by the galvanic process, and producing, in copper, letters of all languages, from which many millions of copies may be printed without any appearance of wear and tear.

M. HAAS, of Prague (367, p. 1028), has distinguished himself by various efforts towards sustaining the long-established reputation of his house.

After the admirable display made by Austria, of numerous specimens of well-executed typography in all languages, the Jury hardly feel themselves authorized to express a wish that, among the great and increasing number of printers in that empire, a few had sent their productions, to show how far the art has advanced without the support of the Government. The only Exhibitor in letter-press, besides M. Haas, was M. BATTAGIA, of Venice (366, p. 1028), who sent fair specimens of typography, in simple and convenient binding. As publishers, MM. MULLER (372, p. 1028), and NEUMAN (373, p. 1028), of Vienna, exhibited books and albums got up with much care.

#### PRINTING—PRUSSIA.

Next to the Imperial Printing-office of Austria we notice that of M. DECKER, the printer to the Royal Aca-

\* Earl Stanhope, when he invented the Printing Press which will bear his name to posterity, coupled with his object an idea of inking the form on the press by means of a revolving cylinder, and in pursuit of this plan spared no expense in endeavouring to find a substance with which to cover his rollers. He had the skins of every animal which he thought likely to answer the purpose, dressed by every possible process, and tried many other substances, as cloth, silk, &c., without success. The unnecessary scum down the whole length of the roller was the first impediment, and next the impossibility of keeping any skin or substance then known always so soft and pliable as to receive the ink with an even coat, and communicate the same to the form with the regularity required. All the presses of his early construction had at each end of the table a raised flanch, type high, for the purpose of applying his rollers; but the obstacles interposed by nature herself totally baffled and defeated his Lordship's plans in this respect.

† This may be judged of at the British Museum, by the unique copy upon vellum, printed by Schoensperger about 1514. It is a magnificent "livre d'heures," the execution of which is even superior to that of the celebrated book of the Adventures of Teuridanck.

demy of Berlin (148, p. 1056). The large folio New Testament, the German translation by Luffner, is a masterpiece of typographic art. The printing of it is perfect, the types are well cut and cast, the ink is black and brilliant, and the paper excellent. Great praise must also be accorded to the edition of the complete works of Frederick the Great, a literary and typographic monument of great beauty, raised by Prussia to its hero. The five volumes in large quarto, already published, are worthy in every respect, by their typographic execution, of the importance of such a work.

M. Decker exhibited, amongst the specimens of types from his foundry, some beautiful Oriental types, engraved in part with the co-operation of the Academy of Berlin, and also specimens of brass rules, of great depth in the engraving, and of very superior execution.

M. LIEPMANN's ingenious invention (147, p. 1056) for printing in oil from a mass of solid colours, as a substitute for semifluid printing inks, has attracted the notice of the Jury, and they hope that when it has been sufficiently improved, this may be a valuable adjunct to ornamental printing.

M. G. WESTERMANN, of Brunswick (749, p. 1091), has shown a specimen of good printing in the work entitled "European Gallery," printed upon German paper.

From Elberfeld, M. BAEDERER's "German Bible," in folio (832, p. 1095), is a specimen of small and neat type printing. M. HAENZEL, of Berlin (284, p. 1065), exhibited bank-notes, and labels in gold and colours, possessing some merit.

#### PRINTING—SAXONY.

M. HIRSCHFELD's, of Leipzig (180, p. 1113), and some other typographic establishments, maintain printing in an honourable position in Germany.

The considerable number of publications printed in a single year by M. BROCKHAUS (178, p. 1112), who is at the same time a printer, a type-founder, a bookseller, and publisher, at Leipzig, has attracted the notice of the Jury. All these publications are directed towards literary and scientific purposes, and each edition is very large. Although his printing aims less at the perfection of the art than at cheapness and correctness, we have nevertheless remarked a charming little volume entitled *Die Bezauberte Rose*, by Schultze.

The books printed and published by MM. VIEWEG, of Brunswick (822, p. 1095), who are also type-founders and paper-makers, are not less worthy of remark for their aim at scientific usefulness. The execution of them is without any attempt at fine printing, but is such as suits this description of books.

M. BARTH's work, "Minstrels of Germany" (179, p. 1112), printed at Leipzig, on parchment, and the publications of M. SCHNEEBERGER, of Frankfurt (30, p. 1124), should also be mentioned.

In general, the Jury have observed, in all the books exhibited in the German Department, great improvements in the paper, in the clearness and neatness of the type, and the quality of the ink.

#### PRINTING—ITALY.

Printing, soon after its discovery, was carried to Rome by some German printers. The Popes Sixtus V., Leo X., and Clement XIV., founded the celebrated printing-office of the Vatican, for the purpose of printing the works of the Holy Fathers and the Holy Scriptures, and of propagating the Catholic Faith. Their beautiful Oriental types give this printing-office an honourable standing, but its publications are few, and do not keep pace with the progress of the times.

The Vendelins of Spire, and the Jenson, were early established in Venice. They introduced some happy modifications into the types, by making them approach nearer to the beautiful letters of Roman inscriptions. The Aldi still further improved them, and invented the sloping types called *italic*. Their beautiful and useful publications are remarkable even in the present day for their typographic execution.

At the end of the last century, and at the commencement of the present, Bodoni, a typographer of consum-

who was at the same time the engraver and founder of the types which he so carefully printed, published his beautiful editions—true masterpieces—which have secured for him the highest renown, but in which the progress sacrificed too much to typographic luxury.

Italy has sent but few typographic productions to this Exhibition; nevertheless the Jury have remarked with interest the large folio volume of "The History of the Abbey of Altscombe," skilfully printed at Turin, by M.M. Cusizo and Mina (89, p. 1805). The type is very beautiful, and each page is surrounded by a border imitated from one of the exquisite manuscripts of the 15th century. The wood engravings have been multiplied by the galvanoplastic process.

#### PRINTING—SWITZERLAND.

Notwithstanding its flourishing trade in books, and the great number of printers established in the Cantons, Switzerland has not given the Jury an opportunity for judging of its progress in typography.

#### PRINTING—ENGLAND.

The first book printed by Caxton, after a long residence in the Low Countries, appeared in London in 1474; and it is worthy of note, that the first book in the English language was printed by him, not in England, but on the Continent, in 1471. Almost all those which he printed, and which he translated himself, to please the Princess Margaret, sister of King Edward the Fourth, and at the solicitation of the great lords and ladies of that time, were devoted to chivalry. His types, and those of his successors, Wyn de Worde and Pynson, are a very elegant imitation of the writing then used in England. Up to the time of Buckley, in 1733, the art of printing made little progress in this country. It was Baskerville who, in 1750, turning his thoughts from jannying to type-founding and printing, first gave to the art a real impulse. He spent several years and much of his fortune before he was able to produce types to his own satisfaction. In 1757 he issued his first book—a *Yagil*, in quarto. Between this date and 1763, he printed those charming editions of Milton, Addison, The Common Prayer, The Bible, Juvenal and Persius, Horace, &c., which are still celebrated for their typographical beauty, and cause the name of Baskerville to be ranked among the most eminent men who have contributed to the improvement of the Art of Printing. The paper which he caused to be made was superior, and all his apparatus for printing, including his ink, presses, chases, punches, mallets, moulds, and types, were produced by himself, and were all great improvements. His process of drying and glazing his paper and ink, as soon as printed, by means of hot plates of copper, was expensive, and had some other faults; but the taste of the period was not then ripe for luxury in printing, and notwithstanding that he offered to print for the London booksellers within five per cent. as low as the printers they employed, he complained that he was unable to get work from them. Accordingly, in 1767, we find him writing to his old friend Franklin:—"After having obtained the reputation of excelling in the most useful art known to mankind, of which I have your testimony, is it not to the last degree provoking that I cannot get even bread by it?" Then, as now, many persons would encourage bad printing, because it was cheaper. His types, though rather lean for large books, were held in much estimation, and in 1779, four years after his death, were sold to a literary society in Paris for £7001., and were, in 1784, first employed in printing Benjamin Franklin's celebrated edition of Voltaire, in seventy volumes, a work at that day unsurpassed in typographic luxury. Thus ended the first great attempt at improvement in England.

At the end of the last century, Mr. William Balmer and Mr. Thomas Baskley made fresh progress in the art of printing. Their beautiful publications rivalled the most remarkable productions of France, Spain, and Italy; and the magnificent edition of the works of Shakespeare, in nine folio volumes, embellished with engravings, was the greatest work of England, and printed by Baskley and Balmer, under the seal of M.M. Didot,

who wished to raise in France a like monument to Racine, and printed a folio edition, unequalled for its typographical perfection.

At the commencement of the present century, the late Mr. Charles Whittingham brought out the elegant editions which have rendered the Chiswick Press so celebrated. Until that time no one had printed wood engravings so perfectly, by the application of *overlays*\* necessary for obtaining gradations in the tints. This success encouraged the engravers to give to woodcuts a fineness unknown in the times of Albert Durer, Wolgemuth, and other engravers, who were obliged to employ broad lines, the unevenness of the paper and the imperfections of the presses rendering the printing of fine lines impossible.†

At the present day, when speed is imperatively demanded by the public, the means of satisfying this demand are everywhere numerous and powerful. This fact may be judged of in London by the printing-office of Messrs. Clowes (printers of the Official Catalogues, and of the Reports by the Juries), in which two steam-engines put in motion twenty-six printing-machines; by that of Mr. Spottiswoode, the printer to the Queen, &c.; and by the printing-offices of "The Times," and other large London newspapers, which publish in the morning the long debates in Parliament, so often continued until late in the night. This rapidity of execution would have appeared fabulous in the last century; and it ought to be remarked that the speed does not, in England, in any way prevent the correctness of the work, which is in general remarkable, even in the immense daily newspapers. This advantage must be attributed, in a great measure, to the maintenance of the ancient custom of the printers in England. Here it is required that there should be seven entire years' apprenticeship of every working printer, whether he is destined to be a compositor or a pressman. This beneficial custom, by means of which the workman becomes more skilful and more attached to his profession, is gradually re-establishing itself in all the countries in which, by reason of political commotions, it had fallen into disuse, to the great detriment of the art.

While in most other countries of Europe the patronage of the Government appears indispensable to the creation or the development of a great number of branches of industry more or less intimately connected with the fine arts and science, England affords a striking instance of how they are capable of being nurtured and developed without this support. The strength of its institutions, its spirit of association, the immensity of its capital, and its indomitable perseverance, enable the typographic art to develop itself solely by its own resources. The Tract and Bible Societies, which have printed the Holy Scriptures in all languages, are a remarkable proof of the power of association stimulated by a religious spirit.‡

The numerous and voluminous encyclopedias, of which the Encyclopædia Britannica alone, in 26 large quarto volumes, has reached its seventh edition, and the large number of important popular publications, also prove the immense resources of this country.

Although neither of the great Universities of Oxford and Cambridge has taken any part in this Exhibition,

\* It is also possible that the system of lowering woodcuts was one of the means adopted by the engravers who were employed for the Chiswick Press, in order to facilitate good work. In 1844, the Trustees of the British Museum permitted casts to be taken of the original wood blocks engraved by Albert Durer, in 1510, of his *Pissis Christi*, and an edition was printed in English, edited by Henry Cole, Esq. These cuts are very much lowered.

† The term *engraving* is misapplied as to the works of Albert Durer and his contemporaries, for it was not the graver but the knife that was used to produce the blocks from which impressions were then taken, after the manner of block cutting for callio printers of the present day.

‡ The statement published in May 1851, by one single institution, the British and Foreign Bible Society, founded in 1804, shows the production of 24,247,667 copies of the Old and New Testament, in one hundred and forty different languages, which have been distributed over the whole surface of the globe by the operations of the Protestant missionaries. The expenditure, exclusive of the annual engagements, has amounted to £2,761,455.

The book is bound in parchment and contains two leaves of vellum. The binding is made of leather and is decorated with gold tooling. The text is written in a Gothic script and is arranged in two columns per page. The margins are wide and contain some decorative elements. The book is a very fine example of a medieval manuscript.

The same principle which protects the printer from exhibiting that which the publisher is the owner of, and which is the property of the public, is the same principle which protects the publisher from exhibiting that which the printer is the owner of, and which is the property of the public. The same principle which protects the printer from exhibiting that which the publisher is the owner of, and which is the property of the public, is the same principle which protects the publisher from exhibiting that which the printer is the owner of, and which is the property of the public.

The following statistical Tables by Mr. Edward Edwards, Secretary of the London Society of Temperance Propagandists, cannot but prove interesting:—

| Ireland                        | 1,500       | 1,300        |
| Total of Journeymen            | 14,500      | 6,000        |

In London, however, during the winter season, and the rate of wages is not so high as in the summer.

There are printed in London, 25 weekly, 25 monthly, and 25 quarterly publications. The majority of the weekly and monthly publications are daily newspapers, and the quarterly publications are 14 daily papers, 14 weekly papers, 14 bi-weekly papers, and 14 other papers. Total, 47. Of these, 34 are printed in London, 13 in the provinces of England and Wales, 10 in Scotland, and 4 in Ireland. The rate of employment during the 14,500 persons in the trade may be stated to be as follows:

|                               | Weekly Employment. | Monthly Employment. | Quarterly Employment. |
|-------------------------------|--------------------|---------------------|-----------------------|
| Journeymen.                   | 8,000              | 1,987               | 1,500                 |
| Boys.                         | 1,500              | 1,999               | 1,500                 |
| London (daily press excepted) | 600                | 200                 | 1,000                 |
| England and Wales             | 1,400              | 1,200               | 1,000                 |
| Scotland                      | 900                | 800                 | 1,000                 |
| Ireland                       | 600                | 400                 | 1,000                 |
| Total                         | 8,100              | 2,300               | 4,500                 |

On the London daily press 480 men are employed; boy labour is not contemplated on this work.

|   |           |
|---|-----------|
| 1. London average wages of 8,000 members -                              | 25        |
| 2. The South Eastern District (8 towns), average wages of 165 members - | 20 to 24  |
| 3. The South Western District (14 towns), 300 members -                 | 20        |

penny stamps, were used by 122 London and provincial newspapers. Seven million and a half of penny stamps, and half a million of postage stamps, were used by 170 London papers. The total number of stamps used was 1,000,000,000.

*Ornamental, or Printing in Colours.*

It is a great pity to find the original publisher of the *Art of Printing in Colours*, in the *Encyclopædia Britannica*, has been the subject of engraving and printing in colour, as pointed out by Albert Smith, Esq., in his preface. The editor in his preface states, "because the superiority of taste," and "the great practical advantages belonging to this method of printing, in that being done in oil, the colour will never be lost. By this means the same beauty continues as long as the paper can hold together." Unfortunately the late scientific opinion, after the lapse of one hundred years the colour of the ink did "fly off" for the specimens of the wood-cuts in oil scarcely retain any of the colour which was supposed to be imperishable as long as the paper lasted. The paper, on the contrary, continues good and strong to this day.

M. J. M. Poulton, in his *Traité Historique et Pratique de la Gravure sur Bois*, 1766, gives directions for making the varnish, and for the choice and picking of colours for printing in colour-wood; and shows specimens of the different states of the impressions in the progress of the printing. Mr. Savage, in "Hints for Decorative Printing," also gives practical directions for ornamental colour printing. His recipes for making coloured inks are, however, incorrect; and although merit is due to him for again calling the attention of printers to the subject, it is perhaps owing to the superfection of his inks, as he describes them, that this beautiful branch of printing remained so long neglected after his book was published.

The greatest impulse given to colour surface printing in this country, was during the existence of the state lotteries, about 65 years ago. The late Robert Branson, wood-engraver, and the late James Visselly, then employed at Messrs. Gye and Balne's printing establishment, greatly promoted the demand for coloured and ornamental printing, the one by his skill as an artist, and the other by his constant endeavours to produce striking effects by means of colour printing; a great stimulation for ornamental work being created by the lottery contractors, who vied with each other to render their lottery schemes more and more attractive. Mr. James Whiting, sen., who was one of the principal printers for the Government contractors, also produced great novelties, and subsequently, in conjunction with the late Sir William Congreve and Mr. Branson, established the extensive printing-office at Beaumont House for all descriptions of ornamental printing, and particularly for protection against forgery. The case No. 128, Class XXX., exhibited by his son, Mr. CHARLES WHITING (p. 299), contained some beautiful specimens of relief engravings rendered more difficult to imitate by the aid of the case engine, names embracing, in which the surface of the die is raised, and composed plate printing,† at one impression, in two or several colours, by plates constructed in tandem with wonderful accuracy at the moment of giving the impression, by cylinder steam machinery: these plates are similar to those so long in use at the Boston and New York Offices, and which are of such great durability, that the leading label plates now in use have produced thousands of impressions during the last 20 years, and are still in use at the Stamp Office. It was by the aid of the machinery that Mr. Norman, of Frankfurt, and Mr. Gmel, of Magdeburg, were both enabled to

introduce their machinery of printing that their respective countries, the one and the other, benefited by Mr. Whiting's three processes, but also benefited by the Government for the introduction of that who has now art to those countries. It would be difficult to say any other process of which adopted in every way as that first process for what it was intended to be of its establishment by Mr. Whiting, sen., Sir William Congreve, and Mr. Branson; and the case exhibited sufficiently demonstrates that Mr. Charles Whiting, who conducted the business, fully maintained its well-deserved reputation.

When the English state lotteries were abolished, ornamental printing fell greatly into decline, and it was not until 1832, when Mr. De La Rue took out a patent for printing playing cards, that there was any revival, such facilities being given by the improved colouring ink which he introduced, and which are described in the specification. Since that period rapid and necessary improvements have taken place here and on the Continent, and coloured surface printing has arrived at a degree of excellence greatly surpassing that of any former period.

Nothing can be more beautiful and more perfect in execution than the charming plates printed in colours by Mr. BAXTER's process (172, p. 248); but the medals having been placed in the Class more especially valuable to the Fine Arts, it is in that Class that an account of their merit must be sought for.

M. SILVERMANN (374, p. 1194, 1195), of Strasburg, has exhibited productions, some of which are remarkable for the beauty of their execution, such as the painted windows of the Strasburg Cathedral, and some imitations of manuscripts, enriched with coloured vignettes by surface printing. Others, again, are to be noticed for their cheapness, such as those little coloured soldiers, of which a hundred and twenty thousand are annually issued, and find a sale in France, Germany, and England.

A geological map, coloured with nine distinct tints; a table representing the effects of the contrast of colours, the employment of which has found a delicious application in the work of M. Chevreul, Member of the Institute, and other prints executed by this process, prove the science, as well as the arts and commerce, will profit by this branch of industry.

In addition to the Printers already mentioned, who in Class XVII., exhibited printing in colours, the following had specimens, in which no special merit was shown beyond that of fair and careful workmanship:—*England*—Mr. J. W. FOLKARD (p. 544); Mr. J. S. HUGHES (p. 545); Mr. SILVERMANN, LONDON (p. 539); Mr. EVANS, of Durham (p. 544); Mr. RAMSAY, of Edinburgh (p. 547); Mr. GILL, of Dublin (p. 547). *Paris*—M. GUYON (p. 418); M. MEYER (p. 1205); M. G. BATTISTINI (p. 1207); M. CHARDON and SONS (p. 1277). *Netherlands*—M. J. H. NOORDHOF, of the Hague (p. 1149). *Zurich*—M. HIRSCHFELD (p. 1118). *Dresden*—M. MEYER and SONS (p. 1124). *Frankfurt*—M. WOLFFMANN (p. 1139). *Berlin*—M. MORGAN and KÖHN (p. 1087), and M. HÄHNEL (p. 1085). *Canada*—Messrs. BURNETT and MONTGOMERY, of Quebec (p. 985); and Messrs. SCARNE and CO., of Montreal (p. 988).

*Printing in Gold.*

Diddis, in his *Decameron* (vol. II., p. 418), states that "This country has also an honour and a treasure of gold, in Mr. Whitaker's 'Magna Charta,' printed in gold, with illuminations. His manner of execution is yet a secret. The Society for the Encouragement of Arts offered Mr. Whitaker a premium for his ingenuity in the execution, as is usual of his making the known; but Mr. Whitaker, aware of the value of keeping it secret, declined the premium. There are copies on vellum, beautiful, elegant, and valuable beyond any similar work of any kind, and as well as medals, which are also printed in gold. Indeed, Mr. Whitaker's 'Magna Charta' is not only a work of great value, but also a work of great beauty."—*Encyclopædia Britannica*.

\* Colour printing was re-introduced by the late Mr. Branson.

† Double-Colour Printing-Machinery.—When Sir William Congreve was engaged in carrying a method of printing in colour, for the government of Hungary, for the printing Department at Government, he applied to Mr. De La Rue, of London, and Mr. Gmel, of Magdeburg, for their assistance in carrying out the plan. Mr. De La Rue, in 1832, took out a patent for his process, and Mr. Gmel, in 1833, took out a patent for his process. The machinery for printing in colour, by the aid of the case engine, was first introduced by Mr. De La Rue, and was subsequently improved by Mr. Gmel. The machinery for printing in colour, by the aid of the case engine, was first introduced by Mr. De La Rue, and was subsequently improved by Mr. Gmel.

of the extraordinary felicity of their execution." The method adopted by Mr. Whittaker is the following, for which the *Jury* is indebted to the kindness of Mr. John Harris (Class XXX., No. 244), who was employed on the work. The page is composed in moveable type in the usual way; a stereotype-plate is taken. A piece of iron of the size of the page, about half-an-inch in thickness, is made hot, and placed on the table of an ordinary typographical printing-press: the stereotype-plate is then placed on the iron plate, and gets hot, and leaf-gold of an extra thickness, of the size of the plate, is laid very carefully on the surface of the plate; then the paper or vellum is placed on the tympan in the usual way, having been previously sifted over with dried glare of egg and rosin finely pulverized, which adheres to it in sufficient quantity; the tympan is then turned down, and the pull dwelt on. The degree of heat must be ascertained by practice; if the plate be too hot, the gold is dead and drossy; if too cold, then it appears bright but imperfect. This process is similar to that now used by bookbinders in block gilding with an arming-press.

About twenty years ago, M. Stars introduced into England printing in gold from copper-plates. His process was to mix with printers' weak burnt oil a certain quantity of gold or silver bronze, to the same consistency as that of strong copper-plate ink, and filling the plate with it, to dab it in with the fingers. The plate had to be engraved deeper than usual, and when filled it was delicately cleaned off, first with a rag dipped in a very weak solution of pearlash, and then with the palm of the hand in the usual way. It was afterwards submitted to a heavy impression of the copper-plate press, being printed in the manner called "through press," and the impression, when dry, polished by passing it through the press several times with the printed face against a highly-polished steel plate, by which a beautiful brightness was imparted to the bronze. This process, decidedly the best where great perfection is required, has been abandoned by most of the copper-plate printers for the cheap and less tedious one of first printing with a coloured-ink ground with gold-size and oil, and then rubbing the bronze on the paper when just printed.

Printing in gold by letter-press soon followed the method of copper-plate gold printing. Messrs. Vazetelly and Branson were the first to apply it; and their visiting and address cards, printed by letter-press, from rose-engine-plates, have never been surpassed for the brightness and beauty of their execution.

About the same period Mr. De La Rue, in conjunction with the late Mr. Balne, of Gracechurch Street, produced a large royal 8vo edition of the New Testament, printed in gold, twenty-five copies of which were in pure gold powder. Nothing has since been produced equal to this unique edition. At the coronation of Queen Victoria, Mr. De La Rue undertook to produce the "Sun" newspaper printed in gold. The rapidity with which this had to be effected was one of the many difficulties he had to encounter. Messrs. Clowes and Sons afforded him every aid by placing at his disposal the printing-machines of their extensive establishment. Upwards of one hundred persons were employed to rub the bronze on the printed sheets, which had to be brought from the printing-office in Stamford Street, as soon as printed, to Messrs. De La Rue's works in Bunhill Row, to be there bronzed and finished. More than 100,000 copies were thus produced; 10,000 in time for the publication of the "Sun" on coronation day.

Gold printing is now applied to numerous purposes in most countries. The following is the best method of producing good and bright results by letter-press printing. Take the best printer's varnish, grind it to a thick consistency with the best burnt menna or brown amber, and reduce this with De La Rue's gold-size until it be of the thickness of this trowel; ink the form in the usual manner, and when pressed apply the bronze by rubbing it gently over the article with cotton wool. If leaf-gold or leaf-metal is required, it must be laid on carefully, and when dry the surface should be wiped, to clear them of the superfluous bronze ground. The gold printing is much improved by its being passed over polished steel plates, between powerful rollers.

The following exhibitors of printing in gold and silver bronze, and in metal, displayed a variety of specimens, all possessing merit.

*England*—Mr. J. MANSELL (p. 589), Mr. KROENHORN (p. 549), Messrs. DEAN and SON (p. 587), and also Messrs. APLISS and Co. (p. 541), who had specimens of printing on tinfoil. *France*—M. ANGRAND (pp. 1162, 1170), M. GUESSE (p. 1188), Madame MAYET, Rue de la Vieille Monnaie (p. 1207), M. METZ, Rue de l'Abbaye (p. 1208), and M. LEVEVRE, of Paris (p. 1311). *Zollern*—MM. SCHAEFER, OTTO, and SCHNEIDER (p. 1056), M. E. MANIAC, M. HAENEL, of Berlin (p. 1068), M. F. FUCHSNER, of Guben (p. 1068). *Bavaria*—M. A. DESAUVRE, of Aschaffenburg (p. 1101). *Grand Duchy of Hesse*—M. FRIEDRICH, of Offenbach (p. 1128). *Warsaw*—MM. FETTER and RAHN (p. 1375). *Austria*—MM. HAAS and SON, of Prague (p. 1028), who had a missal printed in gold, as well as a miscellaneous collection of articles.

#### PRINTING—FRANCE.

As early as 1470, printing was introduced into Paris by the influence of La Sorbonne; its progress was rapid. Rembold, the partner of Gering, Antoine Vêlard, Simon de Colines, Pigouchet, and others, carried the art of printing to a high degree of perfection. The typographical merit of the publications of Robert and of Henry Stephens would itself be very remarkable in all respects were it not surpassed by the high literary merit of those learned printers.

The Camuzats, the Delatours, the Coustelliers, and the Barbons, maintained the good traditions of the ancient printers; and towards the end of the last century Ambroise Didot was intrusted by Louis XVI. with the printing of the collection of the French Classics, called the Dauphin Collection. From the united labour of Pierre Didot and Firmin Didot, who were at the same time engravers, type-founders, and printers, subsequently resulted the beautiful publications at the national palace of the Louvre. They introduced many improvements into the typographic art. By their side and in their establishment youthful typographers were instructed, who have carried the taste for their art into the provinces and into foreign lands.

Now, however, in most countries, by the effect of competition carried to its utmost limits, the distinctive, original, and personal characteristic of the ancient typographers is becoming gradually effaced. The system of the division of labour does not permit them now, as formerly, to cut and cast the type themselves, to make their own ink, to superintend the construction of their presses, or even to take the balls from the hands of the pressmen, to show them how they should be used; to a knowledge of these technicalities many of the ancient printers united extensive literary acquirements.

At the present day competition compels every one to concentrate all his efforts and all his aptitude upon one only of the branches which combine to form the art of typography. The engraver is merely an engraver; the type-founder is only engaged in that branch; so it is with the ink-maker and the manufacturer of printers' rollers, with the bookseller and the publisher, and of necessity even more so with the printer, who can only succeed in this laborious and difficult profession by dint of being above all a skilful manager. In many printing establishments, therefore, there are often two partners; one of them occupied with the technical details of the art, the other with the commercial or administrative department. To this arrangement, and to this extreme division of labour, must be attributed a certain uniformity which is to be observed in the productions of modern typography, and perhaps also an absence of originality. It must, nevertheless, be stated, that in general, and even as a consequence of this concentration of efforts upon every single branch of the art, the results are satisfactory.

The National Printing-office of France was founded in 1640 by Louis XIII., who there collected the punches out by Garamond by order of Francis I., and employed these punches to the most eminent printers of his time, who were honoured with the title of *Royal Printers*. Under the preceding reigns this printing-office had dis-

tinguished itself by large publications, such as the collection of Ordinances of the Kings of France, that of the Fathers of the Church, and of the Councils, and that of the *Dynastical Historians*, &c. At the fall of royalty it became a vast establishment, in which was concentrated all the printing of the Government departments, divided hitherto among private printing-offices. Napoleon considered the direction of it in 1809 to M. Marcol, who had accompanied the expedition to Egypt, and had founded a printing-office at Cairo. Making use of the types of the Propaganda of Rome, which had been removed to Paris, M. Marcol printed the Lord's Prayer in 150 languages.

It was especially under the reign of Louis-Philippe that the printing-office, then a royal establishment, improved its means of execution, and caused a great number of Oriental types to be engraved under the special direction of the most learned Oriental scholars, such as MM. Burnouf, Mohl, Haase, &c. All the types are remarkable for their beautiful execution, and for the happy combinations which, without impairing the purity of form of characters, has simplified their cutting and facilitated their composition. We may particularly instance the hieroglyphic character, composed of 2,400 punches, with which all the Egyptian inscriptions can be reproduced; and the Assyrian character, the decomposition of which has brought down to 100 the number of punches necessary to form its various combinations. The 150 foreign founts in the specimen-book of the National Printing-office offers an interesting subject of comparison with the rich collection of the Imperial Printing-office of Austria. The Jury have particularly remarked the pure taste and perfect execution of the borders printed in gold and in colours, in imitation of the drawings and vignettes of the elegant Oriental manuscripts.

It is to be desired that the National Printing-office of France, following the example of the Imperial Printing-office of Austria, and of the manufacture of Sèvres and the Gobelins in France, should successively increase its rich store of foreign type, and devote itself more especially to every kind of experiment relating to typography. The making of such experiments, which require the co-operation of learned men and good artists, would be honourable for a nation like the French.

The typographic execution, with reference to the types, the harmony, the clearness, and the purity of the designs executed by MM. CHENAVERD and CLERGÉT, is perfect. Nothing can be more beautiful than the three volumes of the Oriental Collection sent by the National Printing-office. These are—

- 1st. The First Book of Kings.
- 2nd. The First Volume of the History of the Mongols.
- 3rd. The First Volume of the Bhagvata Purana.

The Jury have found the bookselling business of Paris honourably represented in this Exhibition by MM. RENOUARD (p. 1194), BAILLIÈRE (p. 1197), and GAUME (p. 1240), for the sciences and literature; by MM. LANGLOIS and LECLERCQ (p. 1190), and by M. PAGNERRE (p. 1225), for educational works; by MM. BANCÉ (p. 1200), GIDE (p. 1188), and CHARLES TEXIER (p. 1228), for architectural works; by M. MATHIAS (p. 1241) for his industrial and scientific library, so suitably adapted to the wants of mechanical science; and, lastly, by Madame HUZARD, for works upon agriculture.

Amongst other works, the Jury have remarked the edition of Hippocrates, in Greek and French, forming seven octavo volumes; and the first volume of the collection of the Greek Physicians, issued from the press of the National Printing-office. M. BAILLIÈRE (p. 1197) is the publisher of these works, as also of the *Anatomy of the Human Body*, by Cruvelhier.

The "Complete Works of St. John Chrysostom, and of St. Basil," with the Latin translation in juxtaposition with the Greek text, and the edition of the "Complete Works of St. Augustine," published by M. GAUME (p. 1230), are beautiful and honourable literary undertakings. Worthy also of mention are the *Lives of the Painters and Artists*, published by M. JULIEN RENOUARD (p. 1190); the *Monuments of Niniveh*, by M. GIZE

(p. 1186), executed at the National Printing-office; and in another class of works some books intended for scientific studies, such as the *Lessons in Botany*, by M. LEMAITRE, and the *Courses of Chemistry*, by M. KERNADT.

French printing has been honourably represented at this Exhibition; for Paris by M. DURENT (p. 1182), whose extraordinary production of fac-similes,\* of old books, in the style of anastatic reproductions, and whose general specimens of printing as exhibited, deserve particular mention; by M. DIDOT (p. 1184), who has raised monuments worthy of the old masters in his last three great publications—the *Thesaurus of Stephanus*, Duncange's *Glossarium*, and *Bibliotheca Scriptorum Græcorum*, all produced in a country village, the whole of the

\* Mr Harris, so well known for his extraordinary production of fac-similes of old books, restoration of defective leaves, &c., has favoured the Jury with the following description of the means he employs. His specimens were in Class XXX., and consequently out of the jurisdiction of the Jury of Class XVII. —

"In the history of mankind there are few things so remarkable, as that the press and the easel have been the means of producing works of art which have most conspicuously tended to the civilization of man and the unity of nations. The avidity with which these productions are sought after, up to the present time, is fully proved by the prices given either for early printed books or ancient paintings, of which the former especially are often imperfect. From this latter circumstance the collector has been induced to seek the means of having ancient and valuable works in typography and painting completed by fac-similes, and thus restoring to the present generation works which most probably in a few more years would have been buried in oblivion.

"It was about the year 1815 that I was first employed by the late Mr. John Whittaker, of Westminster, an eminent bookbinder at that period; and I believe the idea of having ancient books of the early printers, &c., perfected by fac-similes, was first suggested to him by the late Earl Spencer, for whom many books were so done; and numerous specimens are preserved of some of the rarest productions of the press in the library at Althorpe. Specimens are also to be seen in the King's library, which were done in the lifetime of His Majesty King George III., the art of imitation by fac-simile being patronized by him; also by the late Earl Fitzwilliam, the Hon. Thomas Grenville, and many others. I continued to work for Mr. Whittaker till about 1820, when I was sent for by Lord Spencer, for whom I completed a Pentateuch in Hebrew and Chaldean, and several other works; also I was employed by the late Mr. Grenville, in whose library are numerous specimens of various works completed by me, as there are also in the libraries of many other noblemen and gentlemen by whom I have been employed during the last 30 years. It now only remains to give a brief sketch of the process employed. Formerly I made an accurate tracing from the original leaf, and afterwards retraced it on to the inlaid leaf by means of a paper blacked on one side; this produced an outline lettered page, which, by being gone over carefully and imitating the original, produced the desired leaf. This process was found to take up much time, and was consequently expensive, but it was the method I adopted while employed by Mr. Whittaker; and he, to carry out the deception still further, had two sets of tools out of the large and small letters generally used by Caxton, with which he has often been at the trouble to go over the pages after my work was done, to give the appearance of the indentation of the type. The process afterwards adopted by me was to make the tracing in a soft ink, to transfer the same to a thin paper, and to re-transfer on to the intended leaf: by this means I saved one-third, or one tracing of the work, which was a great saving both in time and expense. I pursued this process for some years; but I have within the last 10 or 12 years had recourse to lithography, producing the tracing on to the stone, and finishing up the letters on the same: this has been beneficial, particularly when more than one copy was wanted; but I occasionally find even this process irksome and uncertain, and frequently at this present time have recourse to my own, or the second method described, and execute fac-similes by manuscript process. I have thus endeavoured to give a concise and clear statement of the method employed in producing fac-similes. With respect to early printing, the specimens produced by me are entirely done by hand, and are specimens of a style now little in use in water-colour painting."

composition of the types being made by young girls; by MM. FLON BROTHERS (p. 1243), whose books, albums, vignette engravings, and woodcuts, are of great merit; by M. CLAYE (pp. 1218, 1219), whose illustrated books are of first-rate workmanship, and whose woodcut impressions are truly beautiful; \* and for the provinces, by MM. MAINE† (p. 1192), who exhibit books neatly bound and fairly printed, at most extraordinarily low prices; by M. SILBERMANN (pp. 1194, 1195), who has contributed to improve the art of surface-coloured printing; by M. DESROSIERS (p. 1219), who in a small provincial town has produced his "Ancient Auvergne," &c., in a very creditable manner; and by M. BARBAT (p. 1229), who exhibits illustrated volumes of the Scriptures.

#### PRINTING—SPAIN AND PORTUGAL.

The Jury would have been gratified to see displayed in the Exhibition any typographical production executed in Spain,—the country which in 1772 produced at Madrid the superb edition of "Sallust," printed in such perfection and on such beautiful paper by the King's printer, Joachim Ibarra.

It is in Spain that the most ancient manufactories of paper known in Europe were established.

The same feeling is to be expressed as regards Portugal, for the Jury cannot consider as a specimen of Portuguese printing the sample exhibited from Madeira, under the title of *Amostra de Imprensa*, though every beginning, however small, ought to be encouraged. The printers of Lisbon might have sent some well-known editions of their classics.

#### PRINTING—BELGIUM AND THE NETHERLANDS.

Printing was introduced into the Low Countries at the same time as into England. Martin d'Alost, in 1473, and the Brethren of *la Vie Commune*, at Brussels, published their first works. The art of printing made rapid progress in the skilful hands of Joannes de Westphalia, in 1474, at Louvain, and soon extended itself to Antwerp, Andenaude, Ghent, Bruges, Hasselt, &c. Towards the year 1554, the Plantins at Antwerp, and, in 1616, the Elsevirs, first at Leyden and afterwards at Amsterdam, carried the typographic art to such a degree of perfection, that their publications are still sought after throughout the whole of Europe. The Wetsteins, the Blaenws, and the Morel (who, being ennobled, received permission to continue the art of printing without derogation to their nobility), were imitators and successors worthy of them. The political events of the seventeenth and eighteenth centuries had a baneful influence on the progress of typography, which revived, particularly in Belgium, in 1815. The number of able printers increased considerably in both countries; and, since 1830, Belgium has witnessed with satisfaction the annual increase of original publications, notwithstanding the unfavourable position in which the publishers are placed from the competition of the reprints of foreign works. Such, however, is the influence of the development of a national spirit, that during the last twenty years the Belgian press has issued a greater number of original works than in the 450 years which preceded the recognition of the independence of the country.

Amongst the printers of Belgium, where the mechanical part of the art is good, the town of Malines has long since made itself known by its Prayer and Liturgical Books, successfully and economically printed in red and black—thanks to the incessant labours of M. P. T. Hanicq. Typography is also represented in the Exhibition by the well-printed Bibles and Testaments of M. BEYARD, of Ixelles (p. 1159); the illustrated books and woodcuts of M.

TAMAR, an art recently cultivated in Belgium; the Missals of M. WESTMAEL LEBROU, of Namur (p. 1160); the cheap publications of M. CASTERMAN, of Tournay (p. 1159); the Academical Collections of M. HAYEN, of Brussels (p. 1159); the Statistical Tables of the Population and Agriculture of Belgium of M. LESIGNE (p. 1159); the *Album de Pomologie* of M. PARENT (p. 1169); the Specimens of Illustrated Works of M. MUQUARDT (p. 1176); and the Collection of Letters and the Historical Initials of M. JACQUAIN, of Ghent (p. 1165).

Few printers of the Netherlands have sent specimens of their productions. The neat and cheap Bibles of MM. ENSCHÉDÉ JOHANNES and SONS (p. 1146); the curious Journal of the Embassy of the Earl of Portland in France, printed by M. NOORDENDORP, at the Hague (p. 1149); and the "Graduale Romanum," and "Antiphonarium Romanum," by M. ZWEEBAARDT, of Amsterdam (p. 1149), have been remarked by the Jury.

We will also mention the continuation of the voluminous publication of the "Lives of the Saints," commenced by Bollandus, and forming fifty-three volumes in folio. The first of these enormous volumes, printed in 1843, is entirely devoted to the Life of St. Theresa. It is satisfactory to know that this great enterprise, supported by the Belgian Government, is to be continued, as it equally embraces religion, history, and geography.

#### PRINTING—DENMARK.

The Jury have not been able to judge of the state of printing in Denmark, that country not having sent a single printed book. There was only an ingenious machine for composing the types after an entirely new system.

#### PRINTING—SWEDEN.

M. BROLING, the printer to the Bank of Sweden, exhibited specimens of printing bank-notes by letter-press, of superior merit from their varied combinations, brightness of colour, good register, and the difficulty thrown in the way of forgery by the different processes employed.

#### PRINTING—RUSSIA.

A single broadside sheet from St. Petersburg exhibited specimens of several Russian and Oriental characters surrounding a vignette on wood, representing varieties of the Russian people. The whole is neatly printed.

#### PRINTING—GREECE.

It is to be regretted that the typographical productions of Greece were not exhibited amongst those of other civilized nations. A printing-office was established at Athens at the time of the independence of Greece.

At this Exhibition, Greece has confined herself to inscribing upon her banners, in large letters, the sentences from her ancient poets as the harbinger of a better future:—

Θαυρὸν χερὶ . . . τέχ' ἀδελφὸν ἴσους ἀνθρώπων.  
Ζηλοὶ δὲ οὐ γένετα γένετα  
Εἰς ἀφ' οὗ ἐκείνη. Ἀγαθὸν δὲ ἔστι καὶ βροταῖαν.

#### PRINTING—PERSIA.

Europe might have possessed the art of printing ever since the year of our Lord 1310, had she been acquainted with a work by Rāchid-ed-din, who, as far back as that period, had described the process of printing as known to the Chinese, in his Persian work entitled *Djemma'a et-tevarikh*.

Persia has sent to the Exhibition some beautiful manuscripts only, and some books printed in Europe; nevertheless, the typographic press is not unknown in that country, since a newspaper in the Persian language is published there.

#### PRINTING—EGYPT.

Whilst at the present day the ancient languages of Egypt are printed in Europe with hieroglyphic, Coptic, or Greek characters, it was interesting to see displayed in the Exhibition in London, 165 volumes of all sorts, printed in Arabic, in Turkish, and in Persian, at Cairo

\* By a singular coincidence these three were pupils of the typographic establishment of M. Firmin Didot.

† According to M. Maine's statement, they keep a stock of 1,500 volumes always ready; throughout the year they produce 15,000 volumes per day, averaging 340 pages each volume. They have 20 steam cylinder machines, one machine turning out 14 reams of printed work per hour. All the wood engraving is done in their establishment: they employ 1,200 persons.

(the ancient Memphis).\* Amongst these books we have remarked some which are enriched with arabesques, tastefully executed by means of typography. These are printed upon a peculiar paper, manufactured at Boulac, by the old vat process. The pulp appears to resemble that which is obtained in China and in India by the use of raw materials, such as the bamboo and the banana tree. It may be that the ancient papyrus is now re-appearing in Egypt under this new form. Amongst the Arabian books, devoted almost entirely to military science, medicine, geography, and education, the Jury have remarked *The History of the Kings of France contemporary with the Sultans of Egypt*; *The History of the Ottoman Empire*, by Wassel; *The Advantages of War in a Religious Point of View*; and in translation, *The Geography of Malte Le Brun*; *The Treatise of Good Advice*; *On the Care of Little Children*; *The Children's Friend*, by Berquin; *Tom Thumb*; and, lastly, *A Journey in America*, with a few engravings, also executed at Boulac.

#### PRINTING.—UNITED STATES OF AMERICA.

It is well known that there are some works printed in the United States which give a more favourable idea of the productions of America than those which have appeared at this Exhibition. The American printers have contented themselves with sending a number of newspapers, the printing of which is not remarkable. Even the lowness of price has nothing surprising in it, as there is no stamp duty, neither is there any tax upon paper.

#### PRINTING.—CANADA.

In the collection of articles exhibited by Canada, we have observed a specimen book containing a large number of beautiful types from the foundry of Mr. PALSGRAVE (189, p. 968), at Montreal. He also exhibits some stereotype plates.

#### PRINTING.—AUSTRALIA.

The Jury have examined, with real interest, several works printed in Van Diemen's Land, at Hobart Town, some of them by HENRY DOWLING (361-33, p. 999), such as the *Tasmanian Kalendar* and the *Tasmanian Journal*, in 8vo; and two large volumes, accompanied by lithographs, likewise designed and printed in Australia; and the execution of which is satisfactory.

The same may be said of the *Arts and Ordinances of the Governor and Council of New South Wales*, printed at Sydney, in 1844, by WILLIAM JOHN ROW (4, p. 999), with types cast at Sydney.

It is to be regretted that, introduced as it now is even to the confines of the earth, all the productions of the press have not been represented in this universal gathering; for printing is a gift almost as necessary to man as speech, for the manifestation of his thoughts.

#### New Process relating to Galvanoplastic, Galvanographic, Galvanoglyphic, and Chemotypic Printing.

The Imperial Printing-office of Austria has exhibited the whole collection of the new applications of the typographical art, such as the galvanoplastic process, galvanography, galvanoglyphy, and chemotypy, which, bringing their co-operation to the aid of typography, enable it to reproduce, in some degree, nature itself. It may therefore be said that these new branches are to typography what photography is to the art of drawing.

*The Galvanoplastic Process.*—We have, for instance, seen antediluvian fishes reproduced upon paper, at this Exhibition, with the exactness of nature itself. By means of successive layers of gutta percha applied to the stone inclosing the petrified fish, a mould is obtained, which being afterwards submitted to the action of a galvanic battery, is quickly covered with coatings of copper, forming a plate upon which all the marks of the fish are reproduced in relief, and which, when printed at the typographic press, gives a result upon the paper identical with the object itself.

M. HULOT (p. 1222), a mechanist and chemist attached

\* At Boulac, a suburb of Cairo.

to the Mint of Paris, has exhibited some sheets, each of them containing three hundred heads intended for postage stamps, which are impressed at one stroke, from a plate of brass of a single piece, containing these three hundred figures in relief. By a peculiar process, M. Hulot succeeds in identically reproducing, without the least contraction, the original engraving, which is on steel, but which might be engraved on any other metal, or even on wood. It is by this same process that M. Hulot has reproduced, for the Bank of France, the notes engraved in relief in such perfection by French artists.

*Galvanography.*—The Austrian Printing-office has shown us some remarkable results of this process. An artist covers a plate of silvered copper with different coats of a paint composed of any oxide, such as that of iron, burnt terra sienna, or black lead, ground with linseed oil. The substance of these coats is of necessity thick or thin, according to the intensity given to the lights and shades. The plate is then submitted to the action of the galvanic battery, from which another plate is obtained reproducing an intaglio copy, with all the unevenness of the original painting. This is an actual copper-plate, resembling an aquatint, and obtained without the assistance of the engraver.

*Galvanoglyphy.*—The experiments in galvanoglyphy are no less interesting. Upon a plate of zinc, coated with varnish, a drawing is etched; then, with a small composition roller, a coat of ink is spread upon this varnish and left to dry. The ink is deposited only on those parts where the varnish has not been broken through by the graver, and leaves the sunken portion of the engraving free. When the first layer is dry, a second is applied, then a third, and so on, until it is considered that the original hollows are deep enough. The plate thus prepared is placed in the galvanic battery, and another plate is the result on which all the hollows of the engraving are reproduced in relief. This relief is more or less raised, according to the number and thickness of the coats of ink successively applied. The process was invented in England, and patented by Mr. Palmer, of Newgate Street.

*Chemotypy.*—For the purpose of obtaining casts in relief from an engraving, the process of chemotypy is equally ingenious. A polished zinc plate is covered with an etching ground; the design is etched with a point and bitten in with diluted aquafortis; the etching ground is then removed, and every particle of the acid well cleaned off. For this purpose the hollows of the engraving are first washed with olive oil, then with water, and afterwards wiped, so that there may not remain the least trace of the acid. The plate, on which must be placed filings of fusible metal, is then heated by means of a spirit-lamp, or any convenient means, until the fusible metal has filled up all the engraving; and when cold it is scraped down to the level of the zinc plate, in such a manner that none of it remains except that which has entered into the hollow parts of the engraving. The plate of zinc, to which the fusible metal has become united, is then submitted to the action of a weak solution of muriatic acid, and as of these two metals the one is negative, and the other positive, the zinc alone is eaten away by the acid, and the fusible metal which had entered into the hollows of the engraving, is left in relief, and may then be printed from by means of the typographic press.

*Pneumatography.*—This is a new process, invented by M. GILLOT, of Paris (p. 1201), and consists of a method of reproducing, by means of the typographic press, any lithographic, autographic, or typographic proof, any drawing with crayon or stamp, or any engraving upon wood or copper.

Upon a plate of zinc, polished by means of pumice-stone, the artist executes the required design with lithographic crayon or ink, or transfers impressions from lithography, wood-engraving, or copperplates. The surface is then inked over with a roller, so as to increase the thickness of the ink, which is afterwards consolidated by dusting finely-powdered rosin over the plate, by means of a pad of wadding: the rosin adheres only to the ink, and is readily removed from the other parts of the plate. Afterwards, for the purpose of obtaining a relief block, the plate is placed on the bottom of a shallow trough,

containing very dilute sulphuric or hydrochloric acid. By means of a rocking motion given to the box, which for that purpose is fastened to an axis, the acid is caused to pass slowly and continuously to and fro over the surface of the plate. After the lapse of half an hour, if it be a crayon drawing, the etching is completed, and a relief block is obtained, in which it is only necessary to remove the large whites by saw-piercing. In case, however, of the plate containing written matter, or many very fine lines, it is necessary to withdraw it from time to time, and again ink the surface with lithographic ink, and dust the powdered rosin, so that the edges may be protected as much as possible from the undermining action of the acid; these operations must be repeated until the necessary depth is obtained. Transfers may be made from very old impressions of wood-engravings by sponging them several times at the back with acidulated water, and then operating as is usual with lithographic transfers.

**Music Printing.**—As early as 1490, music was printed by letter-press. The edition of the Psalms, printed at Mayence in 1490, had the music (*plain chant*) in two colours, the notes being in black and the ledger-lines in red. The shape of the notes in this edition is different from the square notes subsequently adopted for sacred music. The notes of the music executed by Peter Hautin, an engraver, typefounder, and printer, were lozenge-shape, and each note was cast separately with the ledger-lines. Peter Attaignant, of Paris, printed, in 1530, twenty-nine songs with this description of music. In 1552, Adrien Leroy, musician to Henry II. of France, and Robert Ballard, his brother-in-law and partner, obtained the title of King's printers for music. The types were engraved by William Le Bé, an eminent artist of that period, and were on the same plan as those of Peter Hautin.

In 1579, Angelo Gardano printed in Venice, from music types, the "*Madrigali à sei voci di Sabino*." The process was the same as Peter Hautin's, but the execution was very inferior. The opera of "*Thése*," the music by Lulli, was printed by Ballard in 1688; the typographical execution was imperfect. The same work, in folio, was printed in 1720, by Beaussenne, from copper-plates, and was so superior to the music printed from types, that the old method was abandoned for that of printing from engraved plates. The exclusive privilege granted to Ballard was maintained in his family, without opposition, until 1699, when Sanleque, another engraver in Paris, obtained letters patent from Louis XIII. of France for a ten years' sole right of printing the *plain chant* music by a new process of his invention. In consequence of this patent, copper-plate music printing superseded typographic music printing as early as 1675. In 1746, M. Dornel, organist of the church of Ste. Geneviève, Paris, entered into partnership with M. Klehin, an engraver and typefounder, for the purpose of casting music types in sand. By this kind of stereotyping the printing appeared to possess some advantages, but the plan was abandoned. In 1764, M. Breitkopf, a type-founder and printer at Leipzig, succeeded in casting music types. The electoral Princess of Dresden was so much pleased with his plan, that she gave him to print the music of a drama of her own composition, called "*Il Trionfo della Fidelity*." In this type music the notes were each composed of separate pieces; and in Germany, until then, there had been only one piece for each note and ledger-line. The system of casting music with the notes separately possessed some advantages, although the composition was tedious and the founts costly. At the same period MM. Enschéde, of Haarlem, caused M. Fleischman, an eminent artist employed in their foundry, to engrave music types, the perfection of which has scarcely been surpassed; but the system which they adopted was too complicated for general use. In 1762, M. Rosart, of Brussels, being desirous of diminishing the number of pieces, cast a new font of music with only 300 separate sorts. M. Fournier, jun., further improved the casting of music types by reducing the number of types to 160. At the opening of the Royal Academy of France in August, 1762, these improvements were noticed.

M. Reinhard, of Strassburg, obtained a patent for a new process of printing music; he printed the ledger-lines from

surface engraved plates, and the notes from moveable types. The work was good, although the notes were of different tint from that of the ledger-lines, in consequence of the two printings. About 1810, M. Olivier, a French engraver, produced beautiful moveable music types, but the mechanical difficulties of setting up rendered this plan useless. In 1832, M. Duverger, of Paris, invented an ingenious mode of casting the notes separately from the ledger-lines. M. Duverger's plan was to compose a page of music without the ledger-lines, he then took a plaster cast, and with the aid of a straight edge he ruled lines in the plaster with a graver to the same level as the surface of the notes; he then cast stereotype plates, and thus obtained perfect music pages for surface printing. MM. Tanterstein and Cordel, pupils of M. Duverger, invented another method of producing music; they set up the music with moveable types combined with the ledger-lines; they then took plaster casts, and simply repaired in the plaster the imperfections in the ledger-line joints, previous to stereotyping. Good specimens of this system were in the Great Exhibition.

The music types of Messrs. SINCLAIR, of Edinburgh, did not possess any novelty, but their execution was good.

M. DERRIET, of Paris (185, p. 1183), is the only exhibitor of music types showing any marked improvement. The notes were cast either in one or more pieces, so as to admit of the ledger-line crossing the notes when they were required to be on the line. Each ledger-line was in one piece, and of the full width of the page, either in brass, zinc, or hard type metal. Music printed from such types is a nearer approach to impressions from engraved plates than any hitherto produced, yet it is doubtful whether by continued wear the interstices may not become visible, and render this system imperfect.

Notwithstanding the many attempts for the improvement of music types, several difficulties have yet to be surmounted before music printed by letter-press can equal that which is printed from engraved plates. Good work is produced by transfers of engraved music on lithographic stones, although the cost of printing is greater than by letter-press.

#### *Punch-cutting and Type-founding.*

In the earliest books printed in Germany, the shape of the letters was at first Gothic; they were then rounded and became semi-Gothic. In Italy, under the influence of the Roman inscriptions, and of the beautiful manuscripts of antiquity, their form was completely changed. A Frenchman, Nicholas Jenson, engraver to the Royal Mint of France, was sent to Mayence, in 1462, by Louis XI., to learn the secrets of the new-born art of printing. Civil commotions having prevented him from introducing this art into France, he engraved in Venice, for the printing-office which he there established, the beautiful types of Roman characters which Garamond afterwards took for his models, and from which models it is scarcely possible to depart, without falling into extravagance or bad taste.

In England, Caxton adopted, for printing his works upon chivalry, a style of letter in imitation of the handwriting of that period. Antoine Verard printed his works in France at the same period, with types very similar, but better cut and better cast. Both seem to have been desirous of giving *fac-similes* of the manuscripts of their times.

The Roman characters adopted by the Aldi, and by the Stephani, caused the semi-gothic shapes to fall into disuse; and it was the elder Aldus who invented the *italic* character, which was engraved by Francis of Bologna, after the beautiful writing of Petrarch.

The Elzevirs employed for their works types engraved by Garamond and Sanleques.

Ibarru in Spain, Baskerville in England, and Enschéde in Haarlem, modified the form of the types in accordance with the then prevailing taste. Of these the letters engraved by Enschéde and Fleischmann, at Haarlem, are very remarkable specimens.

At the close of the last century, the younger Fournier, a punch-cutter and type-founder, caused some improve-

ments to be made in this art, which he has described in his *Manual*.

M. Firmin Didot, who engraved the types used by his father for his beautiful publications, exerted himself for the purpose of imparting to types of all descriptions the highest degree of elegance. Nothing can be more perfect than his punches for the edition of Racine's works printed at the Louvre; and the types, in imitation of handwriting, are masterpieces. Some years later M. Henry Didot engraved small types called microscopic, which were used in printing the edition of the *Maxims of La Rochefoucault* and the works of *Horace*. The types are extremely small, and presented great difficulties both in the casting and in the engraving.

In 1823, M. Louis John Pouchée took out patents for the three kingdoms for a machine for casting type, consisting of a mould formed by a combination of steel bars with grooves and matrices, secured by a frame and a brace of iron upon a strong wooden bench, and a lever carrying a heavy rammer, to fall down into the mould, for the purpose of forcing a portion of the fluid type metal, which had been poured out of a ladle into the receptacle between the ends of the grooves (each groove forming the mould of a separate type), through small apertures into the grooves and matrices (placed at the opposite end of the grooves) where the body and face of the letter are cast. By this apparatus about 200 types may be cast at one operation, and the casting repeated twice in a minute, or even quicker. M. Pouchée, having cast a large quantity of type by this machine, offered the type for sale, and the printers refused to purchase unless at a reduced price; M. Pouchée preferred melting it. At the sale of M. Pouchée's type-founding effects, a quantity of this machine-cast type (which had escaped melting) was sold, and was afterwards discovered to be machine-cast by a private mark on the side, and an after-cut tick. The machine was not offered for sale. But Mr. Reed, a printer in King Street, Covent Garden (related to Mr. Blake, of the firm of Blake and Stephenson, type-founders at Sheffield), was employed by the type-founders to negotiate with M. Pouchée for the purchase of the machine, which was effected for about 100*l*. The machine was conveyed to Messrs. Caslon and Liverymore's and destroyed, on which condition it was purchased. There was included in this purchase a valuable planing-machine, and cross-cutting machine for cutting the grooves. It was the invention of M. H. Didot, to whom M. Pouchée paid 48,000 francs for the patent right in England.

The English punch-cutters, whilst retaining elegance in their types, endeavour to make them more durable, and perhaps more legible, by strengthening the fine strokes and giving a greater slope to their punches, thus obtaining a higher degree of perfection. It must be remarked, nevertheless, that in all their specimen-books the engraving of vignettes and borders has made little progress, and contrasts unfavourably with the beauty of their types. The same remark applies to Germany. In France some degree of taste has been applied to ornaments of this species. Lately, the caprice of fashion has caused the shapes of the letters to be elongated, widened, and made either thin or thick, according to the whim of each engraver. It is the same with the fantastical types fitly designated by the name of *fancy letter*, which are carried to absurdity, in order to attract attention by their very eccentricity.

Mr. Whittingham, at the suggestion of Mr. Pickering, first reintroduced the old letters of Garamond and Jenson, and many of the London printers have since followed; some very beautiful works have already been printed with these old letters, so true it is *there is nothing new in this world, except that which is old*. This saying applies also to the manufacture of paper, for in place of the beautiful paper called *vellum*, the evenness of which is perfect, the English public at the present day give the preference to *laid papers*, though these show the wire-marks of the moulds as much as at a period when the weaving of wire was not thoroughly understood.

Since the invention of casting types by Peter Schoeffer—a process which goes back as far as the origin of printing itself—this art has made little progress. It was only

at the commencement of the present century, that a slight improvement resulted from the use of the mould called the American mould, which renders the work of the founder somewhat more easy.

In 1806, M. Firmin Didot invented the sloping mould, with a salient and returning angle, and by an ingenious division of the letters of the alphabet, and their various combinations, succeeded in imitating English handwriting, which presented the greatest difficulty, and in completely doing away with the inconvenience of leaving the separation between each letter visible, an obstacle which had till then prevented the success of every attempt of this description. The types cut by him and by his son were a real progress in the art, and met with great success in Europe. Copper-plate engraving and lithography alone can vie with the perfection of this system.

About the same period, M. Henry Didot invented the compressing mould, and afterwards the mould which he named *polygamatype*—by means of which 140 letters are cast at once. M. Marcellin Legrand, the successor of M. Henry Didot, has exhibited the products of this mould, which requires great accuracy and great care, in order to give successful results. In spite, therefore, of the advantages which it offers, it is only in his establishment that it has been applied on a large scale with success. Some years since the use of mechanical moulds, moved first by hand (soon superseded by steam-power), was introduced from the United States, where this invention originated, into Germany, England, and France. Germany has been able to turn this invention to better account than either England or France: the cause of this may perhaps be, that in the German alphabet the extremities of the thick strokes of the letters are not terminated by sharp lines intersecting each other at right angles, and which, exposing the least unevenness in *ranging*, constitute at once the merit and the difficulty of type-founding.\*

We had an opportunity at the Exhibition, of seeing M. Brockhaus' mechanical mould, which he has employed with success for a long time in his own printing-office, and in that of M. Didot. In the one the movement of the platten of the mould acts horizontally, and in the other vertically. The injection of the melted material is accomplished in each by means of a piston working in the metal pot, and driving the material briskly into the mould.

In 1844, M. Marcellin Legrand exhibited in Paris a series of 4,600 punches, and the same number of matrices, for the purpose of reproducing all the signs representing the words of the Chinese language. This system, which consists in adding to the piece representing the *key* another piece which modifies it, has completely succeeded, for it has been adopted not only in America, but in China itself, and at the present moment works are printed at Macao, and at Ning-Po, with the types engraved by M. Legrand. We have seen in the Exhibition the Gospels printed in China by the Presbyterian Missionary Society of America. M. Marcellin Legrand was the first to undertake singly this immense labour, by means of which Chinese writing is brought within the compass of European typography. A printed table, in which each word is accompanied by a cipher, is now sufficient to indicate to the workman the cipher corresponding to the word. Each of the types is arranged in the case in numerical order, and bears upon its side a number corresponding with that of the table, thus facilitating the manual labour, and preventing many errors. There was also in the Exhibition, a page printed in the Chinese types engraved by M. Auguste Heyerhaus, of Berlin. By means—1st, of 1,200 punches and matrices capable of combination; 2dly, of 2,800 characters, each engraved in a single piece; 3rdly, of 105 others, called *perpendiculars*, he composed 25,000 different characters. The characters in this system are always divided perpendicularly, whilst in that adopted by M. Marcellin Legrand some of the divisions are perpendicular and others hori-

\* There may be other reasons; for it is well known that the invention patented in this country could be successfully worked. Messrs. Figgins, who purchased it, have obtained from putting it in practice, probably in deference to the journeymen type-founders.

mental. This system, judging of it by the printed page displayed at the Exhibition, appears to be successful. In point of execution, it leaves nothing to be desired; and Mr. William Wells, an accomplished Chinese scholar, residing in that country, has bestowed great praise upon it.\* M. Beyerhaus has also engraved an Egyptian type, at the suggestion of M. Bunsen. The characters of it are open, whilst the two fonts which the National Printing-office of France has had engraved are black (*en silhouette*).

The Imperial Printing-office of Austria, decomposing each part of a Chinese word into as many pieces as it contains strokes of the pen, reconstructs the words by means of these little pieces, which the compositor groups together so as to construct any Chinese word. The number of *points* and *strokes* is about 400, and they appear to be a most complete system of Chinese typography.

Nearly all the languages of the world were typographically represented either in the specimens of the National Printing-office of Paris, in the numerous tables of the Imperial Press of Austria, in the Bibles printed in almost all languages by the Bible Society, in the specimens of general type-founding at Paris, in those of M. Decker of Berlin, or in those of the English founders, and especially in those of the late Mr. Watts of London, who has himself engraved an extensive series of Oriental types, which are an honour to his type-founding, and form the richest series of this kind existing in any private establishment.

Amongst all the types which express the gift of speech, the most numerous and complicated are those of the Chinese language, in which every idea and each word is represented by a different character. Owing to typography, there will soon be no single idiom which may not be saved from oblivion; for typography contributes to the preservation of languages as essentially as did the press of Guttenberg to the preservation of books at the time of its discovery.

The Jury have, in this important branch of art, remarked the productions of the following contributors:—

*England.*—Messrs. CASLOW and Co. (78, p. 543), exhibited a great variety of beautiful types; Messrs. DUNCAN SINCLAIR and SON (92, p. 543), specimens of general excellence; Messrs. FRIGGINS (124, p. 545), types of great excellence and beauty; a super-royal form containing 220,000 pieces of pearl type, locked up and showing the care bestowed in finishing, in order to insure correct justification; and a specimen of curious and newly-cut Tudor type, imitating the inscriptions from monuments and tombs; Messrs. MILLER and RICHARD (150, p. 546), a specimen of ruby type, in which "Gray's Elegy" is printed, thirty-two verses in two columns, occupying 3½ inches in length; Messrs. BAGLEY and Co. (195, p. 550), a great variety of beautiful and original types, among which a complete series of Elizabethan, or church text, as well as the typographical ornaments taken from the remains of Nineveh and Etruria. The Jury also mention the specimens of Messrs. FERGUSON BROTHERS (90, p. 543); of Messrs. STEPHENSON, BLAKE and Co. (182, p. 548); and a curious font of complicated type of the cuneiform character, used in the Babylonian inscriptions, exhibited by Messrs. HARRISON and SON (513, p. 552). Messrs. KING's new music (22, p. 537) presents an improvement, the result of having very few learned types. Mr. AMSTRONG's illustrated music offers no peculiar character.

*France.*—M. DUMÉRY (p. 1183), the eminent punch-gutter and type-founder, exhibited types and flourishes of first-rate merit, and music types with separate ledger-lines running the whole length of the line, in brass or other metal, a great improvement on the ordinary music types—M. GAVRAN's neatly-cut and cast letters (234, p. 1187) deserve mention—MM. LABOULAYE and Co. (295, p. 1223), successors to Didot, have shown great skill in their printing types. M. ROUSSEAU (361, p. 1194) exhibits music composed with moveable types and matrices, in which there appears to be no marked novelty.

*Russia.*—M. RÉVILLON (361, p. 1339) has shown good specimens of Greek, Oriental, and other types.

*Sardinia.*—The Jury have remarked MM. FARINA's (47, p. 1304) small punches and types.

*Holland.*—MM. BUCHÉDÉ and SONS (79, p. 1146) maintain the reputation of their old establishment for good printing types and stereotype plates.

*Germany.*—Besides the Exhibitors whose merits have already been noticed, M. DRESSLER, of Frankfurt (5 Koll., 24, p. 1122), exhibited types said to be of new metallic composition; M. SCHULTZE, of Dresden (3 Koll., 182, p. 1118), a variety of printing types; and M. HAHNEL specimens of types, brass types for bookbinders, electrotype matrices for casting large types, and electrotypes from woodcuts, all possessing merit.

#### *Type-founding in the United States.*

Before the separation of the American colonies from the mother-country, paper, printing-presses, and types were almost all imported from England. Christopher Sower, who established a printing-office at Germantown, near Philadelphia, in 1735, was the first who cast his own types. In 1768, Mr. Mitchelson attempted to set up a foundry in Boston, and the same year Mr. Iruel another in Connecticut, but neither of them were successful. Soon after the close of the American War, however, Mr. John Baine, of Edinburgh, established a type-foundry at Philadelphia, and he was, it is believed, the first who regularly carried on the business of type-founding in the United States. But the importation of British type, and the small number of newspapers, still constituted difficulties in the way of success. Baine died in 1790, and his partner returned to Scotland. About this time Mr. Archibald Binny and Mr. James Ronaldson established another foundry at Philadelphia, unconnected with any other business, and were eminently successful. In England, at this time, the assortments of type in the foundries were about twenty in number, of which the largest was the twelve-line pica, and the smallest the diamond, of 202 lines to a foot. The assortments of Messrs. Binny and Ronaldson at first embraced only the more essential fonts, such as brevier, bourgeois, long primer, small pica, pica, and two-line letters. At this period the increase of printing in the United States was most extraordinary. The number of newspapers in ten years from 1790 increased from 70 to 200, and the number of offices for miscellaneous printing exceeded 50. The printing business in these ten years increased probably threefold. There was, of course, a corresponding increase in the business of type-founding; and before long Messrs. Binny and Ronaldson's assortment became as extensive as in the chief foundries of England. It is to them the world is indebted for the first real improvement in type-founding since the days of Peter Schoeffer. This important improvement was in the type-mould, by means of which a caster could cast 6,000 types in a day as easily as he could have accomplished 4,000 by the old process.

About the beginning of the present century the invention was introduced into Europe, and is now generally known as the *American Mould*. Messrs. Binny and Ronaldson's type was considered good at that time; with it Dobson printed the first American edition of the *Encyclopædia*, in 21 large 4to. volumes, 1798–1803. About the year 1805, another type foundry was set up in Baltimore, by Samuel Sower and Co., which contained some of the moulds and matrices used by Christopher Sower mentioned above, who cast his own type in Germantown in 1740. They were chiefly for German letters. To these were now added a variety of excellent Roman and Italic types, and among others the diamond with a smaller face than had ever before been cast either in Europe or America. Nearly about the year 1805, Messrs. White and Wing established a foundry at Hartford, in Connecticut, where they devised and used a plan of their own for casting twenty or thirty letters at a time, and are said to have brought their invention to a useful degree of perfection. On Mr. White's removal to New York, in 1811, when he established the first regular and extensive foundry in that city, this invention seems to have been abandoned, and the old plan of casting by

\* M. Beyerhaus has made a smaller type, which is also very well executed.

single letters was pursued, as it is to this day. Thus we see that in 1811 there were four foundries in the United States. During the preceding ten years the newspapers increased from 300 to 360, of which 27 were daily papers. It is estimated there were at least 500 printing-offices in the country; indeed so great was the demand for type in 1811, that it advanced in price 25 per cent. on what it cost in 1806. In 1813, Messrs. D. and G. Bruce established another foundry in New York, which soon became a stereotype foundry, of which we shall speak in another place. In 1818, and within a very few years after, type and stereotype foundries were set up in Boston, Cincinnati, Buffalo, St. Louis, Louisville, &c. The business soon became overdone, and the price of type receded to the old standard of 1806, and caused many failures.

In 1828, Mr. William M. Johnson took out a patent for the invention of a machine for casting type, by which he was enabled to give a sharper outline and better face to the letter by using a pump to force the liquid metal into the mould. This idea subsequently underwent many modifications and improvements by different individuals. Several patents for improvements in the machinery for casting printing types have been issued within the last ten years, so that at present all obstacles to this mode of producing types seem to have been surmounted, and this practice is now in general use—in large establishments chiefly by the aid of steam. By these improvements three times the quantity of type is produced by a caster in a day that was cast by Binny and Donaldson's improved mould, and five times the quantity that was produced by

the hand-mould half a century ago. On the first of June 1850, there were 2,800 newspapers in the United States, with an average circulation of 1,785 copies, giving the enormous aggregate of 498,600,000 copies printed annually. There were 350 daily and 2,000 weekly newspapers. The whole number of printing-offices is now not less than 4,000. Hence the demand for printing types is constantly and rapidly increasing. There has been a corresponding increase in type and stereotype foundries. There are now four foundries in Boston, seven in New York, three in Philadelphia, one in Buffalo, one in Albany, two in Connecticut, one in Baltimore, and one in St. Louis. These twenty establishments give employment to about 800 persons, and produce daily 4,400 pounds of type. By the recent improvements in machinery, type is at present produced at a cheaper rate by 25 per cent. than in 1841. These twenty foundries supply not only the United States, and a great part of Canada, but export largely to the British, Spanish, and Danish West India Islands, Mexico, and South America. The exports of printing-presses and types for the year ending June 1851, amounted to 71,401 dollars. The quality of the American type will, it is said, bear a favourable comparison with that of Europe, and it is cheaper. The metal used is a mixture of lead, antimony, and tin, in proportion to the kind of type required. The average of lead is 75 per cent.

A statement of the prices of types for the last half-century may be interesting, we therefore give a table of them from the last Official Report, naming only some of the principal sorts.

| NAME OF BODY.  | # | 1801     | 1806     | 1811     | 1819     | 1827     | 1831     | 1841     | 1850     | 1850                 |

| Diamond - -    | - | -        | -        | -        | -        | -        | -        | -        | 1·60     | 6 7½                 |

The application of electrotyping to the formation of matrices is another improvement deserving mention, inasmuch as it saves much labour and tends to the reduction of price. The process is probably the same as that employed in England and France, but in America it is much more extensively used, in consequence of no law of registration being in existence there as in the former countries. It is found that the Patent and the Copyright Acts do not reach this case, as there is no date-mark on the type to identify it. The consequence is, that the moment any new or improved letter or ornament is produced either in Europe or even in the United States, it is at once electrotyped and reproduced by all the other foundries. This seems unjust, although it tends to render the types more uniform throughout the country.

A patent has very recently been granted—10th December 1850—to Mr. George Mathiot, for an ingenious device for preventing the electrotype cast from adhering to the original plate. Many ways have been tried to obviate this difficulty, but the present is considered to be a decided improvement upon them. On the 20th of August 1850, a patent was granted to Mr. Luke Vander Van Newkom for a new process of plating or coating the surface of metallic printing types, stereotype plates, and other printing plates, whether cast or engraved, with an additional coat of metal by means of galvanic electricity. This process of coating types with copper is asserted to be of great practical utility, and is said to add much to

the durability of the types.\* We are indebted to Mr. Ewbank's Official Patent Office Reports for 1851 for most of the facts stated.

Among the American exhibitors of types were Messrs. HOBART and ROBINS, of Boston (399, p. 1462); and Mr. T. TORR, of New York (394, p. 1462); the latter exhibited combinations or logotypes, which he states are unequalled for rapid composition, although it is well known that in the "Times" newspaper office they were disused many years since, as presenting no advantages over separate or single types. Lord Stanhope also tried logotypes without greater success.

#### Stereotyping

is one of the means for making fac-similes in type-metal of pages of types, woodcuts, &c., for surface printing. At the commencement of printing, the idea of stereotype must have occurred from seeing the reproductions in relief of legends upon bells cast in the middle ages; it is probable, however, that many attempts failed from the imperfect means used. As early as 1736, all the pages of Bibles in German and French, set up in moveable types, were kept standing by many printers. In the last century Samuel Luchtman obtained plates by a process of *stichlage*,

\* Messrs. Orchard, Willis, and Co. of London, are the patentees for the United Kingdom, and for France, Belgium, and Holland.

from which he was enabled to print. About 1700, Valleyre printed in Paris some almanacs and pamphlets which he had obtained by casting. In 1725, Mr. William Ged, a goldsmith in Edinburgh, produced some stereotype plates from which he printed, in 1739, an edition of *Sallust*, but his process was little encouraged, and it was abandoned after his death, although those that opposed his method did not scruple to use his plates. In 1729, Mr. Ged entered into partnership with Messrs. James and Fenner, of London, for the purpose of carrying on the stereotype business. In 1782, Mr. Tilloch joined Messrs. Foulis, of Edinburgh, for the same purpose. In 1784, M. Hoffman, of Alsace, France, succeeded in obtaining stereotype plates from moulds of clay mixed with gelatine. He printed a work entitled "*Récherches Historiques sur les Maures, par Chénier*," in 3 vols. 8vo.; but the process was found imperfect, and was soon afterwards abandoned. In 1791, M. Carez, of Toul, a printer, conceived the plan of attaching to a heavy piece of wood suspended from a beam, a page of moveable types, well-looked with screws, in a proper frame, with the face downwards, and letting it fall sharply on lead in a state of fusion, just when on the point of setting; he thus obtained good matrices, which were used to make relief stereotypes by attaching these matrices to the piece of wood as already described, and letting it fall on fusible metal when also just on the point of setting. Good plates were obtained; but it often happened that the types were melted when the lead was too hot, or bruised when too cold. This mode of stereotyping was therefore abandoned, and yet the plan of polytyping, carried on to this day, is not very dissimilar, although the use of more perfect machinery and different metal has much simplified the process, and rendered it less destructive to the types.

Profiting by these various attempts, M. Firmin Didot conceived the idea of casting types in very hard metal, composed of 30 parts of lead, 30 of antimony, 30 of tin, and 10 of copper. He gave to these types less height than their solidity might be increased; then, by means of a fly-press, he pressed each page (composed of these hard types, strongly fastened together in an iron box) into a plate of pure lead. The plate or matrix of the page thus obtained was affixed to the under side of the hammer of a stamping press, on the bed of which was placed in a paper case an alloy, still in a state of fusion, similar to that used for ordinary types, and at the moment when after having been rolled up into a pasty consistency in this paper case it was upon the point of setting, the matrix of the page applied to the stamping press descended upon the alloy, forming a page in relief, the clearness of which was perfect, as may be seen from the collection known by the name of the stereotype edition, composed of more than 200 volumes. At the same time that Firmin Didot succeeded by this process, M. Herhan, who at first had been his partner, resorted to another method, which consisted in striking in copper a great number of matrices arranged in such a manner as to admit of the pages being set up with these matrices as if they had been types, with this exception, however, that instead of being in relief, like the letters, the matrices were sunk. The page when composed was attached to the hammer of a stamping press and allowed to fall upon an alloy still in a state of fusion, and thus a whole page in relief was obtained by means of these hollow matrices. This expensive process was attended with more inconveniences than that of Firmin Didot. Both of them were superseded by the process invented by Lord Stanhope in 1800, who, resuming the first attempts at stereotyping, moulded in plaster or in alabaster, the pages composed with ordinary types, and obtained casts in relief by drying the moulds in a proper manner, and plunging them into a vessel filled with metal in a state of fusion.

Numerous attempts have since been made to substitute for plaster moulds the employment of sheets of paper with whiting placed between them, but the results appear inferior to the plaster moulds.

For vignettes, casts of bitumen answer very well, and stereotype plates of bitumen give good results.

Among the products which particularly deserve to be mentioned, are those of the RUBELAND DUCAL FOUNDRY.

INSPECTION (780, pp. 1093, 1094), whose specimen of stereotype in cast iron, with the Bible printed from it, shows a new application of that metal; of Messrs. KNIGHT and HAWKES (107, p. 544), who exhibit good specimens of stereotypes from engravings in wood, steel, &c., and plates for printing in various colours; and also of Messrs. MANCHIN and MORSE, of London (128, p. 545), for their successful application of bitumen to the purpose of stereotype. This process, although new in England, seems to have been used in other countries for some time, and in the "Illustration," by Mr. PRON, who has an improved mode of mounting the plates. Mr. BARKER's specimens of casts (189, p. 550) from wood matrices are produced by a most ingenious process, of foreign invention. They are used extensively by calico-printers in Manchester and other places. The mode of obtaining these casts is as follows: a pattern of the size required is put on wood in the manner well known to pin and coppered pattern makers, care being taken that, in driving the pieces of copper in the wood block, they are forced to equal depth. Tin in a melted state is then poured on this pin or coppered pattern to the thickness of half an inch, and when cold the pattern block is placed on the bed of a screw-press, constructed for the purpose, and held fast by means of screws, whilst the part on which the tin has been poured, is affixed by clamps to the screw of the press, and by it drawn out from the pattern-block, the tin holding in a solid mass the copper forming the pattern, and leaving the wood as a matrix, from which a number of plates can be obtained by casting with fusible metal. The casts exhibited by Mr. BARKER are very beautiful and perfect, and of greater depth than can be obtained by any other known process. Mr. MITT, of Glasgow (174, p. 548), had an electrotype from a page of diamond type, which appeared good. M. CURMER, of Paris (135, p. 1177), had some specimens of stereotype from paper moulds, which seems to be the same system as that patented by Mr. Kronheim some years ago, and which did not prove practicable. Mr. STARR, of Philadelphia (88, p. 1438), also exhibited stereotypes and electrotypes of some merit.

#### Printing Ink.

The ink of the earliest printed works of the fifteenth century presents to our view every desirable quality. It is black, glossy, and the lapse of four centuries has demonstrated the fact that it has retained its primitive qualities up to the present day. It is not the same with later impressions, in the greater part of which the ink is more or less decomposed; nevertheless that which the Aldi, the Stephani, the Elzevira, the Ibarra, the Bodoni, the Plantin, and all other printers who were zealous for typographical renown, manufactured themselves, has retained all its primitive quality. At present the manufacture of ink is in many respects good, and the grinding, which cannot be too complete, has become more perfect by the application of improved machinery; but the ink is too often deteriorated by adulteration.

It is especially to Mr. De La Rue that this manufacture owes some real improvements, as may be judged from his specimens of printing in different colours, both upon card and upon paper. The brightness of his colours is as remarkable as their variety, and his inks are capable of being glazed almost immediately after printing. The brightness of the printing in gold, executed by his process at his manufactory, is very superior to others. At the same time it is doubtful whether the brightness of vermilion ink is equal to the intensity of the red used in the printing of the fifteenth and sixteenth centuries.

As to the printing inks sent to the Exhibition, time is the only test capable of deciding their respective qualities, and as, moreover, an ink suitable to one climate may not suit another, and lastly, as the ink must be differently modified according to the state of the atmosphere, always so variable, the Jury, on weighing these considerations, have deemed it their duty to refrain from giving any opinion upon this class of products, fearing that their judgments might be set aside by time, which alone is able to disclose the truth.

*Composition Printing Rollers.*

Lord Stanhope entertained the idea that the forms at press could be inked by some better means than by the usual printers' balls. He had recourse to revolving cylinders for that purpose, and tried them covered with skins dressed expressly in a variety of ways, but without success. Eventually, Mr. Foster,\* an ingenious compositor, adopted the composition of the dabbers used in the potteries and made printers' balls with it. He laid it upon canvas, and when thus prepared, he produced what was so much required; the composition balls held the ink better, distributed it evenly, and imparted it equally over the form; they were easily kept clean, soft, and pliable, and thus the first improvement in inking by hand was accomplished. In 1811, while engaged upon the invention of the Polygonal printing-machine, Mr. Bryan Donkin's attention was directed to the improvement of printing rollers, which, as before stated, had been imperfectly made of soft skins; and the idea struck him of casting cylinders of a composition of treacle and glue, similar to that used by Mr. Foster in his printers' balls. He accordingly had some cast in tin moulds, and applied them to Donkin and Bacon's printing machine. These rollers were soon introduced into general use, but it was found that the composition became too hard and dry to retain its elasticity, and by the advice of Mr. Tytrel, the celebrated mechanical engraver, a certain quantity of carbonate of soda was introduced into the composition, whereby the elasticity was rendered more durable. Both Mr. König and Mr. Cowper used these rollers in their printing-machines, with Mr. Donkin's permission, some time after their invention.

At the commencement of 1819, M. Gannal, of Paris, who had been for a long time occupied in the manufacture of mouth glue, which consists of a mixture of sugar and glue, and Mr. A. Chegaray, overseer in Mr. Smith's printing establishment in Paris, made printers' rollers of this composition. They are stated to be more durable than those made of treacle and glue.

In 1813, when Messrs. Applegath and Cowper's printing-machines came in more general use, the patent inking-tables and composition rollers were introduced to the hand-presses; but the prejudices of the pressmen against their use were carried to such an extreme, that it appeared almost impossible to succeed in introducing them. Mr. Harrild, however, whose knowledge of the printing business rendered him equal to the task, persevered in conciliating the pressmen, and demonstrating to them how greatly the adoption of this beneficial invention would be for their advantage, till after displaying the most untiring energy, his efforts were at last crowned with success; and he had thus the satisfaction of not only benefitting the men themselves, but of also rendering an essential service to the printing business. He was rewarded by the large demand created for rollers, every pressman becoming as eager to put aside the use of balls as he had been to oppose that of composition rollers. The manufactory which he subsequently established, and the perfection of his inking rollers, prove his sound knowledge of what was required. Messrs. Harrild's manufactory is now on an immense scale, and supplies the greater part of the printers in England with inking-rollers, which possess every requisite quality. Mr. Cowper, who is the inventor of inking-tables and hand-rollers, has never benefited by this valuable acquisition to the printing business, a fact which cannot but be regretted. Messrs. HARRILD (157, p. 284) exhibited in the Machinery Department, Class VI., inking composition rollers and balls, and were the only exhibitors of this kind of rollers.

M. LENDENMANN (Switzerland, 232, p. 1281), of Grub, Canton of Appenzell, Switzerland, was the only other

exhibitor of printers' rollers, which he called "Swiss imitation caoutchouc." The Jury had no means of practically ascertaining the merit of these rollers, but it must be stated that the fissures on their surface left anything but a favourable impression.

*Printing for the Blind.*

The Jury have noticed with pleasure the large number of exhibitors, from England, France, the Zollverein, and the United States, of inventions and devices for the instruction of the blind. It has been estimated that in the European countries one person out of every 1,200 or 1,400 of the entire population is blind, and in America one in every 2,000. The great and increasing attention that is paid to the intellectual and moral instruction of this unfortunate class is one of the distinctive features of the progress of our age. A few years ago printing for the blind was considered only a curious or doubtful experiment, but it is now established beyond all question that books are true sources of profit and pleasure to them. Whilst embossed books have recently very rapidly increased, it is delightful to notice that the blind readers have multiplied far more rapidly. These circumstances have induced the Jury to attempt a brief historical sketch of the origin and progress of printing for the blind, together with the present state of the art.

The invention of printing for the blind marks a new era in the history of literature. The whole credit of this invention, so simple yet so marvellous in its results, belongs to France. It was M. Valentine Haüy, who, in 1784, at Paris, produced the first book, printed with letters in relief, and soon after proved to the world that children might easily be taught to read with their fingers. It has been said by his biographer that he took his idea of embossed typography from seeing that Mademoiselle Parodis, a blind pianist of Vienna, who visited Paris that year, distinguished the keys of her instrument by the sense of touch, and also readily comprehended the maps in relief which a short time before had been invented by M. Weisembourg of Mannheim. After employing letters of different forms and sizes, and experimenting with the blind as to the precise shape of the letter that could be the most readily distinguished by the touch, he at length fixed upon a character differing very slightly from the ordinary Roman letter, or perhaps a little approaching *italics*. There was the usual mixture of the upper and lower case, the capitals taking more of the *script* form than the small letters. He submitted his first efforts and experiments to the Academy of Sciences of Paris. A committee was appointed to examine them, consisting of the Duc de la Rochefoucauld, M. Desmarests, M. Demours, and M. Vieq-d'Azir, and their favourable Report on the 18th of February, 1785, rendered his success a triumph. Great éclat attended the public announcement of this invention. A new Institution was established, called the *Institution Royale des Jeunes Aveugles*, and M. Haüy was placed at the head of it. Among the books which he embossed were a grammar, a catechism, and small portions of the Church service, and also several pieces of music. The printing of the music was inferior. The abbreviations which he introduced into his grammar, it has been said, did not afford sufficient advantages to counterbalance their inconvenience. His principal work, is entitled *Exposé de différents moyens vérifiés par l'expérience pour les mettre en état de lire à l'aide du tact, d'imprimer des livres dans lesquels ils puissent prendre des connaissances de langues, d'histoire, de géographie, de musique, etc.; d'exécuter différents travaux relatifs aux métiers. Imprimé par les Enfants Aveugles. Paris, 1786, 4to.* This celebrated essay was translated into English by Dr. Blacklock, the blind poet, and in 1793 was published in London with his poems, in quarto. On the 26th of December 1780, twenty-four of Mr. Haüy's pupils exhibited their attainments in reading, writing, arithmetic, music, and geography, before the King and the royal family, at Versailles, who were delighted with the wonderful results. For a while all went on prosperously, but M. Haüy's friends soon began to give him credit for less rather than discretion in the management of his Institution, and consequently as the novelty wore away their

\* It is stated, on the authority of Mr. Harrild, that the composition was discovered by a Mr. Edward Dyas, printer and parish-clerk, of Madely, near Wellington, Shropshire, from the simple circumstance of a glue-pot being upset, and not having a pelt ball ready, Dyas took a piece of glue in a soft state, and laked a form with it. It is further stated that he added treacle afterwards to keep it soft. Mr. Harrild himself introduced composition balls in 1810.

admiration cooled; the funds fell off, and the Institution languished until it was put upon a government foundation. The blind really received but little advantage from an invention that at first promised so much. The fault, however, seems to have been not so much in the plan as in the execution of it. The books were bulky and expensive, and the letters, though beautiful to the eye, and clearly embossed, wanted that sharpness and permanence so essential to perfect tangibility; besides that, though the letters filled three spaces, they were too small to be well adapted to the sense of touch. Large editions of the few books printed were published, the idea having taken a strong hold of the public mind, so that though the evil was soon perceived, it was not easy to abandon the defective alphabet and assume a better, for that step involved the sacrifice of all the previous labour. Hence this noble invention, except, perhaps within the walls of the Institution, soon sank into oblivion, and very little more was heard of it until 1814, when Haüy, having fallen into disrepute, was pensioned off on 2,000 francs a year, and Dr. Guillié, an active and enterprising gentleman, was made *Directeur-Général* in his place. Dr. Guillié soon revived the printing, and having considerably modified the letters, commenced the publication of a series of elementary and other works, among which are the following (see Table No. I., p. 415).

The mechanical execution of these volumes was exceedingly heavy. Most of them were ponderous folios and very expensive, still they formed for many years almost the only literature of the blind, not alone in France, but in other countries. We should not omit particularly to mention the following book which has come under our notice:—*Notice Historique sur l'Instruction des Jeunes Aveugles. Par M. Guillié, Directeur-Général de l'Instruction Royale des Jeunes Aveugles de Paris. Paris, Imprimé par les Jeunes Aveugles, 1819, 4to, 52 pages, with 17 lines to a page. Two leaves are pasted together, so that it is read as if embossed on both sides of a sheet. This is the second edition, the first having been embossed in 1817, the third in 1820, and a fourth edition enlarged in 1821. On page 52 is a curious specimen of printing in relief, in colour, so as to render the letters more easily read by the eye. This book was a valuable contribution to the library of the blind, but still retains nearly all the objections that were made to Haüy's first books; it can only be read by those possessing a very delicate touch. It is replete with information respecting the means then employed for the instruction of the blind in Paris; it proves, however, that the art of embossed typography had made but very little progress. It is singular that in this book no mention is made of the author's predecessor, Haüy, to whom, we should not forget, the idea of finger-reading is due.*

Between the years 1821 and 1840 very little printing was done by this Institution, except religious books, and music after the system of notation by letters and ciphers. The annexed is a list of them (see Table No. II., p. 415).

*L'Institut des Jeunes Aveugles de Paris*, since its foundation in 1784, has at times been in a deplorable condition, but about the year 1840 it underwent a thorough reorganisation, and is now, under the able management of M. Dufau, justly entitled to the front rank of institutions of this class in Europe, from its usefulness no less than its age. A radical reform in the printing department has been made: M. Dufau has devised a system of types consisting of capitals and lower-case Roman letters, and has greatly improved the character of the embossing. The French books are now well embossed, sharp, clear, and durable. They have also been so much reduced in bulk that they are offered at a moderate price. M. Dufau has proposed to print a *standard library* for the blind, to consist of 10 vols., in quarto, for elementary instruction, and 10 vols. for higher instruction. The first series is nearly completed, and this is the list (see Table No. III., p. 415).

The second series of this library, not yet printed, it is to be hoped will soon follow. For the above lists, and other interesting information respecting the Paris typography for the blind, the Jury is much indebted to a valuable pamphlet published by M. J. Guadet, entitled

*L'Institut des Jeunes Aveugles de Paris, son Histoire et ses Progrès d'Enseignement, Paris, 1850, 8vo, pp. 115.*

At Vienna an institution for the blind was established in 1804, but the Jury is not aware of any printing having been executed in Austria before the year 1820 or 1831. About this date the intelligent publishers Treusinsky, of Vienna, embossed sheets with the Lord's Prayer in various languages, in Roman letters, and afterwards printed works for elementary instruction. The subject has been recently taken up by the Imperial Printing-office, and several volumes have been published, but the Jury are unable to give a bibliographical description of them.

In 1806, M. Haüy was invited to establish institutions for the blind at Berlin and St. Petersburg. His system of instruction was adopted in each of these institutions, and the books used were for a considerable time supplied from the press of Paris. Both of these institutions in a pecuniary point of view were unsuccessful to M. Haüy, and in 1808 he returned to Paris, and for a while resided in quiet with his brother the celebrated Abbé Haüy.

The Jury have not been able to trace the progress of the printing for the blind at Berlin or St. Petersburg, but they learn that the amount of matter embossed in Germany until very recently did not exceed half of the New Testament.

It was in Great Britain and in the United States that the first improvements were made in embossed typography; and only within the last 15 years that the blind generally have derived any considerable advantages from books. Before 1826, when Mr. James Gall, of Edinburgh, first began to turn his attention to the intellectual and moral education of the blind, it is believed that not a single blind person in any public institution of this country or America could read by means of embossed characters. To Mr. Gall is due the credit of reviving this art. With the most commendable zeal, patience, and perseverance, he canvassed the form of every letter until at length he adopted his angular alphabet. He seems, from his own *Historical Sketch of the Origin and Progress of the Literature of the Blind, Edinburgh, 1834, 8vo, pp. 388*, to have experimented long and patiently with a great variety of arbitrary and Roman alphabets, with a view of finding one sufficiently simple and tangible for finger-reading. On the 28th of September 1827, he published "A First Book for teaching the Art of Reading to the Blind; with a short statement of the principles of the art of printing as here applied to the sense of touch. Edinburgh, published by James Gall." This is believed to be the first book printed for the blind in the English language. It is a small oblong octavo volume, of nine pages, price sixpence, with four preliminary leaves in which the author sets forth his "principles." The embossing is in high relief, and though it presents rather a rude appearance from the fact of its having been printed from wooden types, yet it soon rendered the practicability of reading by the blind a matter of experience in Great Britain. Mr. Gall then issued sheets printed by metallic type, which were easily read by the pupils in the asylum at Edinburgh. Encouraged by his success, in March 1828, he issued his prospectus for the publication, by subscription, of the *Gospel by St. John*, but it was not until about the middle of 1829 that he perfected his alphabet to his own satisfaction. He tried three different founts of type:—first, the *double english size*; second, the *double pica*; and third, the *great primer*; and, after printing and cancelling sheets in each of these three founts, he at length, in January 1832, finished the printing of his great work. The blind must ever feel indebted to Mr. Gall for the zeal and honest endeavour which he displayed in accomplishing what he thought would most benefit this unfortunate class. Notwithstanding the last sheet of his work was printed in January 1832, yet it was not till October 1834 that he was enabled to publish it. It is entitled, "The Gospel by St. John, for the Blind: with an Introduction, containing some Historical Notices regarding the Origin of a tangible Literature for their Use. By James Gall. Edinburgh: James Gall, 24 Niddry-street. 1834. In 4to." The Introduction, in common type, comprises 18 pages. The text, in embossed characters, consists of 141 pages, with 27 lines on a page

\* These four histories were composed by M. Guadet upon a new plan, and are peculiarly adapted to the use of beginners.

of 70 square inches. The leaves are not pasted together. The subscription price of the volume was one guinea, but it was subsequently sold for 6s. Gall was very sanguine of the entire success of his noble enterprise, and, probably, had he chosen a less angular character, and one a little more resembling our common alphabet, as he has since done, he would soon have seen his books used in every institution in the country. His alphabet was the chief objection raised to his system. His printing was clear, sharp, and permanent, and his books in every respect were a great improvement on Haily's and Guillié's. He published five or six other little elementary books in 1834, at the time he issued his chief work; but his system seems not to have come into extensive use. It is to Mr. Gall, perhaps, more than to any other man that the interest in the education of the blind was awakened throughout Great Britain and America. Nor has he allowed his exertions to flag. In 1837, he published "The Epistle of Paul the Apostle to the Ephesians, printed for the Blind, on the largest type." The shape of the characters is similar to that upon which the Gospel of St. John was printed, but instead of being smooth the letters are fretted or serrated. It is a small octavo volume of 72 pages, 17 lines to a page; 250 copies were printed at the price of 1s. 6d. It is printed in the lower-case letters without capitals. The Epistle to the Philippians was also printed, in octavo, price 1s. 6d. The following year he again modified and improved his alphabet by bringing it back to a still greater resemblance to the common alphabet, but unfortunately he yielded to the suggestion of the Society of Arts of Edinburgh by introducing the use of capital letters at the beginning of sentences and proper names. His next book was "The Gospel according to St. Luke, printed on the common alphabet, for the use of the Blind, and capable of being read by any blind person, 1838. Printed for the British and Foreign Bible Society, London. Printed by James Gall, 22 Niddry-street, Edinburgh." This is a well-printed volume of 158 pages, 28 lines on a page of 70 square inches; price 5s. The same year the Acts of the Apostles were printed in the same serrated letter in 150 pages, price 5s. Besides these books Mr. Gall printed a series of tracts for the blind for the London Tract Society, in 1837, price 6d. each. It is a matter of surprise that these excellent and well-printed books of Mr. Gall are not more generally used. With the exception of the school at Abbey Hill, near Edinburgh, it is believed they are adopted by no public institution in Great Britain. It is still a question if the roughness of the serrated character possesses any advantage over the smooth, sharp embossing. Old and used books are frequently preferred by the blind to new and fresh ones.

While Mr. Gall was thus engaged at Edinburgh, the Rev. Mr. Taylor, of York, displayed an intelligent and active interest in the education of the blind. In 1828, he published the *Diagrams of Euclid's Elements of Geometry in embossed or tangible form*, in 8vo. This was done on Bristol board, but was found too expensive. His mode of embossing, we believe, was forcing the paper, by means of heavy pressure, into the deep cut lines of a copper plate. It was not successful. He published also a map of England and Wales. In 1836, he printed in raised characters "Selections of Psalm Tunes and Chants" in oblong 4to. Also a short history of Elijah the Prophet, and of Naaman the Syrian; and the History of Joseph.

The efforts of Mr. Alexander Hay, in the cause of embossed typography, deserve mention, although an entire failure. He devised an alphabet of 26 arbitrary characters, which by certain combinations could represent the abbreviations and double letters; so that in all, he had 68 characters. He procured types and other printing apparatus, and in 1829 or 1830, issued a prospectus for publishing the Gospel of St. Matthew, at 7s. 6d. The book was never published.

The public interest in the blind became so great, that in 1833 the Society of Arts of Edinburgh offered a gold medal of the value of £100 for the best communication on a method of printing for the blind, and the result was that between the 1st of January 1833, and the 31st of December 1835, no less than 19 different alphabets

were submitted, of which 16 were in a purely arbitrary character. The grand problem was to produce an alphabet that would unite cheapness and legibility.

While the puzzling question of an alphabet best adapted both to the fingers of the blind and the eyes of their friends, was under warm discussion on this side the Atlantic, Dr. Howe was developing his system at Boston, in the United States. In 1833, the Perkins Institution for the Blind was established at Boston, and Dr. S. G. Howe, a gentleman distinguished through a long series of years for his philanthropic labours, was placed at its head. As Gall had done, Dr. Howe took Haily's invention as the basis of his system, and soon made those improvements and modifications which have rendered the Boston press so famous. He adopted the common Roman letter of the lower case. His first aim was to compress the letter into a comparatively compact and cheap form. This he accomplished by cutting off all the flourishes and points about the letters, and reducing them to the minimum size and elevation which could be distinguished by the generality of the blind. He so managed the letters that they occupied but a little more than one space and a half instead of three. A few of the circular letters were modified into angular shapes, yet preserving the original forms sufficiently to be easily read by all. So great was this reduction, that the entire New Testament, which, according to Haily's type would have filled nine volumes, and cost 20l., could be printed in two volumes for 16s. Early in the summer of 1834 he published the Acts of the Apostles. Indeed, such rapid progress did he make in his enterprise, that by the end of 1835 he printed in relief, the whole of the New Testament for the first time in any language, in four handsome small quarto volumes, comprising 624 pages, for four dollars. These were published altogether in 1836. The alphabet thus contrived by Dr. Howe in 1833, it appears, has never since been changed. It was immediately adopted, and subsequently became extensively and almost exclusively used by the seven principal public institutions throughout the country. It is now the only system taught or tolerated in the United States, and deserves only to be better known in Great Britain and elsewhere to be appreciated. In America, seventeen of the States have made provision for the education of their blind, and as universal education is the policy of the country as well as its proudest boast, these books for the blind soon became in great demand. Dr. Howe some time since proposed a library for the blind, and with a view of increasing the number of books as rapidly as possible, arrangements have been made between the several institutions and presses to exchange books with each other, and not to print any work already belonging to the library of the blind. This harmony of action, together with the uniformity of the typography, presents so many obvious advantages, that the Jury cannot but wish a similar system were pursued by the institutions of Great Britain and the continent of Europe. We subjoin a list of the books printed at the press of the Perkins Institution in Boston (see Tables p. 417).

From this list it appears that, exclusive of the three volumes not fully described, 7,903 pages, containing on an average 77 square inches, have been printed at this press, or more than 12 times the quantity of matter contained in the New Testament. Almost all the books are stereotyped, and small editions are struck off as they are required. They are sold at the actual cost, the cost of the larger works being averaged on an edition of 250 copies. The above prices include the binding; 50 per cent. discount is made for books sold in sheets. The books are embossed in the Institution under the superintendence of Dr. Howe himself, by means of a powerful press, built for this purpose. The sale of books in 1851 amounted to 427 dollars. This, however, is exclusive of the Scriptures. The American Bible Society, which now uses the stereotype plates of the Bible described above, distributed last year 140 volumes of the Bible. In short, the Boston books possess a neatness, clearness, sharpness, and durability of impression peculiar to themselves. The seventh volume of the Cyclopaedia is already printed, and the Jury learn with pleasure that the printing of the remaining volumes will be resumed and probably be

finished in 20 volumes very soon. Want of funds is the temporary and only obstacle.

About the time that the Perkins Institution was established at Boston, another was set up in Philadelphia. A meeting of benevolent persons was called on the 21st of January 1833, when arrangements were made to open a school for the instruction of the blind, and Mr. J. R. Friedlander was placed at its head. This school became the Philadelphia Institution for the Blind by Act of Incorporation, 27th of January 1834. The blind owe much to Mr. Friedlander for the Philadelphia contributions to their literature. On the 21st of November 1833, he held his first public examination, and astonished the public by the progress of his pupils in reading, writing, geography, music, &c. The pupils read fluently from tangible letters executed by themselves with *pin-types*. These were small pieces of wood about two inches long, having a letter cut in relief on one end, and the same letter formed at the other by steel points. Maps of the world and of the United States were also exhibited, made by perforating the outline from behind. The result of this exhibition was highly satisfactory. In his address, Mr. Friedlander set forth the great advantages that would accrue to the blind by a general system of instruction. He repeated the usual unanswerable arguments against the adoption of arbitrary characters, and lithographic or phonetic systems, and strongly recommended the use of our own alphabet. He followed generally Haüy's plan of instruction. Early in 1833, Jacob Snider, a young gentleman, native of Philadelphia, applied his mind to the contrivance of a method of printing in relief. The alphabet at first adopted was a mixture of the upper and lower case italics, and the relief was produced by heavy pres-

sure on thick paper between two sheets of copper having the letters deeply cut. The embossing was thus on both sides. His first attempt, after printing a few elementary sheets, was on the Gospel of St. Mark, which he completed by the end of 1833, in a large quarto volume, and published early in January 1834. An account of his first American book for the blind may be found in Poulson's American Daily Advertiser of the 10th of January 1834. The four Gospels were soon after printed in Roman capitals; but being found too bulky and otherwise objectionable they were abandoned, and a smaller, more compact, and sharper type, in the Roman capitals, was adopted. For the list of books printed at the Philadelphia press, see Table, p. 418.

It appears that the Boston and Philadelphia Institutions were founded almost simultaneously, and that their presses and system of typography were established without being apprised of the efforts of each other. Time, however, has at length remedied this diversity. The typography of the Philadelphia books is exceedingly well executed, and compares most favourably with the best of the Glasgow books, but the press has ceased to work, and printing in capital letters will not probably be resumed. From the preference which the present distinguished and intelligent Director of the Philadelphia Institution, Mr. William Chapin, late Superintendent of the Ohio Institution, is known to entertain for the Boston system of typography we may reasonably hope that when printing shall be resumed there it will be with Howe's alphabet. It is the opinion, however, of Mr. Chapin that all the American Institutions should unite, not only in the use of the same alphabet, but that they should all contribute to support one press. It may be

remarked here that the pupils in all the American Institutions read fluently in both the upper and lower-case letters, but it is presumed that Philadelphia and Glasgow books will soon be entirely abandoned there; and as the Boston books can now be obtained in London at a price cheaper than any of the five different systems of books printed in Great Britain, it is to be hoped that they will come into general use here. If it be thought that the letters are too small for adults to read with ease, books may be printed with larger types, and even then be less bulky and expensive than any of the systems in arbitrary characters now in use.

In the year 1848 or 1849 the Virginia Institution set up a press, and has printed several elementary and school books. The Boston type is adopted, with the exception that capitals are used at the beginning of sentences and proper names. This alteration, in the opinion of the Jury, is not an improvement, as the blind are thus compelled to learn two alphabets instead of one. The Virginia books are well embossed, and it is hoped that in future books capitals will be omitted.

To the American Bible Society at New York much praise is due for their commendable efforts in the circulation of the Scriptures among the blind. The stereo-type plates of the Bible in six volumes, executed at the Boston press, under the superintendence of Dr. Howe, now belong to this Society. They have printed a second edition from the same plates, and annually distribute gratuitously from 100 to 300 volumes.

It had ceased to be a matter of surprise in the United States that the blind could read, before the public attention was loudly called to the subject in Great Britain, for we see that in 1836, there were two active printing establishments for the blind in the United States; by one the whole of the New Testament had been published in a cheap form, in the common lower-case letters, and by the other the four Gospels in Roman capitals. Let us now return to the Society of Arts of Edinburgh, and their Prize Medal, to which we have already referred. It was not until the 31st of May, 1837, that the Society's Medal was awarded. In 1836, when the 19 different alphabets were before the Committee of the Society, circulars were drawn up and distributed, with specimens of the several alphabets, to the various institutions for the blind in England and Scotland, and every means employed to arrive at a correct result. The opinions of Mr. Taylor, of York, and Mr. Alston, of Glasgow, seem to have been those which the society chiefly followed. They were in favour of the common Roman capital letter, merely deprived of the serifs, or small strokes at their extremities, and accordingly the prize was awarded to Dr. Fry, of London; and on the 31st of May, 1837, a Medal was granted to him for the invention of an alphabet which appears to have been in use since 1833 in Philadelphia.

On receiving the Society's circular in 1836, submitting the forms of all the competing alphabets to him, Mr. Alston was struck with the simplicity of Fry's, and imme-

diately conceived the idea of making such alterations as he thought necessary, and putting it to the test. The changes made were simply to reduce the size of the letters and render the faces thinner. On the 26th of October 1836, he exhibited his first specimen of printing in relief in the Roman capital letter at a public examination of the blind. It was Fry's alphabet slightly changed to improve the sharpness of the embossing. He then made a successful appeal for a printing fund. After great exertions and most commendable perseverance he procured a printing-press, with two founts of type, and the other necessary printing apparatus. In January 1837, he issued a few elementary works. By March 1838, he had made such progress that the whole of the New Testament was printed in four super-royal 4to volumes. The type is great primer, and there are in the four volumes 623 leaves of 42 lines to a page. In December 1840, Mr. Alston completed the printing of the Old Testament in 15 super-royal quarto volumes, in double pica type. Of nine of the volumes he printed 200, and of the remaining six, 250 copies. There are in all these 15 volumes, 2,535 pages, with 37 lines on a page. Mr. Alston was justly proud of his great work, the entire Bible, containing the Old and New Testaments, in 19 volumes. In his "Statements of the Education, Employments, and Internal Arrangements adopted at the Asylum for the Blind, Glasgow, with a short Account of its Founder, &c.," 10th Ed., 1846, 8vo, p. 80, he says, "this is the first Bible ever printed for the blind;" but in this he was evidently in error, as we have shown that the greater part of it had long before been printed in Boston. We allude to these facts merely because it seems a matter of much regret that Mr. Alston should have devoted so much enterprise and money in producing the Scriptures when he might have ascertained that they had already been printed, and could have been bought at less money than it would cost him to print them. The main difference between the Glasgow and the Boston alphabets is that one is in the upper and the other is in the lower case, which difference is certainly not of sufficient consequence to demand two editions. Had he expended the same energy and money in producing other valuable books, and exchanged them with the Boston and Philadelphia Institutions, as he was urged to do, the three Institutions would have been greatly benefited by the large outlay, and the blind of both countries would have had a great increase to their library. On the 18th of January 1838, the officers of the Philadelphia Institution wrote to Mr. Alston, informing him that they possessed a printing press, and "understanding that you adopt the same character, it appears to our Board of Management that both Institutions would gain by an interchange of volumes." Mr. Alston at once acceded to this proposition, and immediately shipped 186 volumes, being 10 full sets of the New Testament, and 50 single copies of the Gospels besides multiplication tables and other works. We subjoin a complete list of the books issued from the Glasgow press since its first establishment.

Since the death of Mr. Alston, on the 20th of August, 1846, the Glasgow press has almost ceased to work. A few of the volumes have been reprinted. It is at present engaged in reprinting the Gospel of St. John and the Acts of the Apostles. Since 1837 it has been almost the only press that has supplied England, Ireland, and Scotland with embossed books in Roman type. These books are typographically well executed, and the Jury think that Mr. Alston and the Glasgow press are deserving of great praise. The objections, however, to the small Roman capitals, in which most of the books are printed, are such that it is to be hoped that ere long this press will follow the example of that at Philadelphia, and adopt Howe's typography.

It has generally been supposed that the Glasgow press was the only one in Great Britain that printed anything of consequence in the common letter. But we cannot omit to mention a valuable work that has come under our notice; it is a "*Magazine for the Blind*, London: Simpkin, Marshall, & Co., Stationers' Court; Price 6s.; in twelve monthly parts. 1839-40." After two volumes were printed, the first Magazine for the Blind in this country was discontinued. It is in quarto form, and has 23 lines on a full page. The type is the ordinary mixture of the upper and lower case of Roman letter, and the work is beautifully printed. The first volume contains 76 pages, and the second 73. It is to be regretted that so valuable

a contribution to the literature of the blind should not have found better support. It consists of miscellaneous information, with fragments of authors, poetry, anecdotes, woodcuts, &c.

In 1806, an Institution for the Blind was established at Stockholm, and it is with pleasure that we learn that Mr. Watts, of Crown Court, London, has, at the expense of the British and Foreign Bible Society, printed in relief, with the ordinary Roman type, in capitals and lower-case, the Gospel according to St. Luke, in Swedish, for this Institution. The volume was printed in 1843, and is a beautiful specimen of embossed typography. It is in quarto, consisting of 132 pages, 27 lines on a page of 70 square inches. Price, as sold by the Bible Society, at cost, 6s.; 500 copies were printed.

In France, Belgium, Prussia, Austria, Switzerland, Sweden, and the United States, the Roman lower-case alphabet is used. In most, if not all, of these countries, the Institutions for the Blind are supported and partially controlled by Government, and perhaps this is the reason why, in all of them nearly, the same system of typography prevails.

In Great Britain, however, the case is different. There are now five entirely different systems of typography in use here, and vigorously pressed upon the benevolent public. The unfortunate blind are thus deprived of the advantages they might have if harmony of action and

uniformity of typography were adopted. This diversity of opinion is causing great injustice to them, and the Jury cannot but urge upon the parties concerned the speedy adoption of some one system throughout the country. Our opinion is decidedly in favour of Howe's American typography. Perfection is not claimed for this system, but it seems to us that there are fewer objections to it than to any of the others, and it may be the more easily improved; but any one of the five principal systems now used in England is far better than so many. The present state of printing in the Roman character in Great Britain is, as we have seen already, that every press has been stopped, while the books in arbitrary characters seem to be increasing and gaining public favour. The principal of these is one known as Lucas's. It was devised by T. M. Lucas, of Bristol, about the year 1835. It consists of arbitrary characters, and is said to be founded on Byron's system of stenography. It is simple, speedily learned, and easily read by the touch, and is generally acknowledged to be all the arbitrary systems the best. The printing in this system began at Bristol, and the following are the works published there:—

1. The Gospel according to St. John, edited by T. M. Lucas, inventor of the system for teaching the blind to read by embossed stenographic character; July, 1837; Bristol; in 4to, 66 pages, and 27 lines to a page. Two pages are pasted together.

2. The Acts of the Apostles (according to the au-

thorized version), in T. M. Lucas's embossed stenographic character; 1838. Published under the direction of the Bristol Society for Embossing and Circulating the Authorized Version of the Bible for the use of the Blind; Bristol; in 4to, 118 pages, 27 lines on a page.

This second publication of Mr. Lucas was announced as containing some improvements,—as widening the spaces, and lessening the abbreviations.

3. The Gospel according to St. Matthew (according to the authorized version), in T. M. Lucas's embossed stenographic character, 1839; published, &c.; Bristol; 4to, 116 pages. In this third publication is announced the firm conviction that this system will prevail over any other plan, on account of its tangibility.

4. The Gospel according to St. Mark, &c.; Bristol, 1840; 4to, 71 pages.

The above, with the exception of a few small elementary works, are, we believe, all that appeared at Bristol. In the year 1839, a Society was formed, called "The London Society for Teaching the Blind to Read." They adopted Lucas's system, and have been gradually improving it. The following year the types and printing apparatus was transferred from Bristol to London; and in 1841, the Society issued "The Epistle to the Romans." Since then their press has not been idle, as the following list will show. The printing is now done by the blind at the Institution in the Avenue Road, Regent's Park.

In May 1836, the "London and Blackheath Association for embossing the Scriptures in various languages, and for teaching the Blind to read on the Phonetic System," was established. Its object is to stereotype the Holy Scriptures in James Hartley Frere's phonetic characters. About the year 1839, Mr. Frere devised a cheap plan for embossing or stereotyping. It consists simply of small wires, drawn with angles laid down upon tin plates. The wires are bent, and cut by means of ingenious spindles to form the characters, which are similar to those of Gurney's system of short hand. The wires are attached to the plate by heating it sufficiently to melt the coating of tin, into

which the wire sinks and is fast when cold. The common printing press is used in embossing. Mr. Frere's books are read from left to right, and back, after the manner of the ancient Greek boustrophedon writing. Mr. Frere's books are well embossed, and from his plates the books can be printed as they are wanted. The objections to phonetic alphabets are obvious. Mr. Frere, however, does not claim to supersede the common spelling, or the common printing, or common embossing, but to form an easy introduction to them. The following is a complete list of Mr. Frere's books.

More recently still another system has been devised by Mr. W. Moon, Master of the Brighton Blind Asylum. The characters are arbitrary, though Mr. Moon defines them as the "Common Alphabet Simplified." He claims also a new mode of stereotyping, by which the characters are rendered sharp and prominent. The lines are read forwards and back like Frere's plan, and it is even more bulky and expensive than his. The new mode of stereo-

typing is believed to be quite the same as Frere's, by means of wires laid on tin plates. We subjoin a list of Mr. Moon's publications:—

The different sizes of the print are distinguished thus:—

1. Lines very wide apart, for beginners.
2. " wide.
3. " nearer.
4. " flatter as well as nearer.

| -              | English Dictionary (begun 1850) - - - - -   | 1               | ob. 4to. | 1850                 | -                | -                                  | -                 |

If now the NEW TESTAMENT, printed in all the six systems used in the English language, be taken as a standard of comparison, the following Table will show the results:—

| SYSTEMS.            | Number of Vols. | Size.    | Number of Pages. | Number of Lines in a Page. | Number of Square Inches in a Page. | Price.   |
|---------------------|-----------------|----------|------------------|----------------------------|------------------------------------|----------|
| The New Testament:— |                 |          |                  |                            |                                    | £. s. d. |
| Howe's - - - - -    | 2               | 4to.     | 430              | -                          | 117                                | 0 16 0   |
| Alston's - - - - -  | 4               | "        | 623              | 42                         | 90                                 | 2 0 0    |
| Gall's - - - - -    | 8               | "        | -                | 28                         | 70                                 | 2 0 0    |
| Lucas's - - - - -   | 9               | "        | 841              | 27                         | 70                                 | 2 0 0    |
| Frere's - - - - -   | 8               | ob. 4to. | 723              | -                          | 110                                | 2 10 0   |
| Moon's - - - - -    | 9               | "        | -                | 25                         | 110                                | 4 10 0   |

By a comparison of all these lists it will be found that Howe's books are not only much less in bulk than any of the others, but are also much cheaper.

#### APPARATUS AND BOOKS FOR THE BLIND.

England.—Mr. E. A. HUGHES (20, p. 537), of Mount Row, Westminster Road, exhibited a machine for enabling persons born blind to write, in raised characters, without using types; a machine to write with a pen or pencil in skeleton Roman capitals; a machine to cast accounts and make general arithmetical calculations by tangible characters; a machine to copy and compose music on paper, &c. Mr. WEDGWOOD, of Lombard Street, exhibited an improved noctograph, useful to persons who have become blind, after having learnt to write.

THE SOCIETY FOR TEACHING THE BLIND TO READ (198, pp. 550, 551), Avenue Road, Regent's Park, exhibited embossed books for the blind; ciphering boards for the blind; maps for the blind; geometrical boards for the blind; apparatus invented by Mr. W. Wood, for enabling the blind to emboss Lucas's characters, and thus to communicate with each other; a specimen of music by Mr. Wood, for the blind, in raised characters; and chess-boards for the blind. The system adopted is Lucas's, which has already been fully described, and has the objection of being in arbitrary characters: this also applies to the machine. This is a well-established Institution, and great pains were taken during the whole of the Exhibition, by the master, Mr. Wood, to demonstrate the successful operation of this various plans he has adopted to educate blind persons.

Mr. JAMES GALL, Myrtle Bank, Edinburgh (171, p. 548), exhibited Gall's triangular alphabet for the blind, which, by its similarity to the Roman alphabet, is said to be easily read by eye and touch without previous instruction. A volume, containing the Epistle to the Ephesians, printed with this alphabet, and Gall's apparatus for writing by and to the blind. The apparatus consists of a stuffed frame, on which paper is placed; of a cover with bars to guide the lines, which are written from the bottom

upwards; and of small stamps, with the letters formed of common pins, which are pricked through the paper and read on the opposite side.

THE EDINBURGH SCHOOL FOR THE BLIND, Abbey Hill, Edinburgh (170, p. 548), exhibited Dr. Foulis' tangible ink for the blind. This ink contains a large quantity of solid matter, which is deposited on the paper, so as to present a raised surface to the finger. Dr. Foulis' manuscript music notation for the blind. Mr. Gall's typhlograph for the blind. Mr. Gall's system of arithmetic for the blind, accomplished by common pins stuck into a pin-cushion, and Mr. Gall's types for correspondence, by which blind persons can correspond with one another, or jot down memoranda for private use. Dr. Foulis' tangible ink appears to present some advantages, and will probably become a useful adjunct to the numerous means devised for the instruction of the blind, and for enabling them to read and write. The letters on the specimens exhibited were sufficiently raised to be quite perceptible to the touch.

#### APPARATUS, &c., FOR THE BLIND—UNITED STATES.

Mr. C. STARR, of New York (89, p. 1498), exhibited books for the blind. Two Bibles, embossed with Dr. Howe's characters. Two leaves are pasted together, and a stout strip of paper stuck between and around these leaves, so as to form a rim to prevent the characters from being flattened on shutting and opening the book. This plan has also the same advantage as if each leaf were printed on both sides. The types are rather small, but the whole work is one of merit.

Dr. S. G. HOWE, Boston (439, p. 1463), exhibited books for the blind: his system has been fully described, and to it the Jury give the preference above all others.

Mr. DODGE, Superintendent of the American Department, exhibited Xenophon and Virgil; characters on Dr. Fry's plan, known as the Glasgow type, all in Roman capitals. This is the system adopted at the Manchester School for the Blind. It has been in use for about 15 years.

THE INSTITUTE FOR THE BLIND, Stanton, Virginia, exhibited specimens of books and types for the blind. The characters are capitals and lower-case; the printing is sharp and good.

#### APPARATUS, &c., FOR THE BLIND—FRANCE.

M. MARCELLIN LÉGRANT, Paris (884, p. 1906), exhibited type-plates to print in relief for the blind. The characters are rather too small, and possess the disadvantage of having both capitals and small letters.

#### APPARATUS, &c., FOR THE BLIND—AUSTRIA.

G. B. MARCHET, of Lodi (139, p. 1014), exhibited a writing-machine for the blind, producing the characters in black or in relief. The letters are formed with pin points, and they are sufficiently tangible; but having capitals and small letters, this plan offers the disadvantage that two alphabets have to be learnt.

#### APPARATUS, &c., FOR THE BLIND—BAVARIA.

MM. FEHR and EISENBERG, Augsburg (2 Zolvi. 54, p. 1100), exhibited metal plates, with letters and characters in relief. The letters are too broad, and are not well adapted for the blind.

The Jury beg to suggest that a uniform system should be adopted, and that, in future, all books printed for the blind should be printed in the same character. Dr. Howe's plan appears simple, easy, and fit for general adoption.

## II. BOOKBINDING.

Splendour in the binding of books is a taste which dates back from remote times. The rarity of manuscripts, and the ornaments of every kind with which they were enriched, rendered them so precious that they were exhibited upon desks for the purpose of gratifying the sight and the pride of their possessors. Seneca said of them: "*Plerique libri non studiorum instrumenta sunt, ad oculum ornamenta.*" But if these rich bindings, some beautiful models of which still exist in public libraries, were suitable before or soon after the invention of printing, when books were almost as scarce as manuscripts, they are an anachronism, when we are compelled to heap them so closely in our libraries. These magnificent covers, executed for the greater part by jewellers, who enriched them with reliefs in gold, silver, steel, and ivory, with precious stones, with enamels, and with decorations of every kind, could only be suitable for the missals, and the antiphoners placed in churches. On seeing at the Exhibition, inclosed in the beautiful articles of furniture from Austria, the superb bindings in ivory carved with so much art, or in gold and silver inlaid with gems, and enamels still more precious, it might be supposed that these were shrines inclosing sacred relics, or even the casket of Darius, in which Alexander deposited the poems of Homer.

Between simple bindings and those in which costliness is carried to extreme, a medium may be found which lovers of books delight in, combining elegance with solidity and simplicity, qualities preferable to richness of gilding. At the period of the *Renaissance*, artists of great taste executed admirable bindings for kings, princes, and a few rich and learned amateurs whose names are preserved in the recollection of bibliopoles, who maintained in their houses binders whose taste they directed.\* Some chose the Byzantine style; but the greater portion adopted the style called the *Renaissance*. After them, the binders confined themselves to imitation, applying this style of ornament indiscriminately to every species of book.

Some attempts have been made to submit bookbinding to general principles, and to adapt the binding either to the period in which the books were written, or according to the subjects of which they treat; and a variety of ornaments have been devised in consequence. The idea, though a happy one, is not new, but has not generally

been adopted. We have seen the cap of liberty, the owl, and the wand of Æsculapius applied to bindings with respect to the contents of the works. The Egyptian, Grecian, and Roman ornamental emblems have been resorted to, as well as the Gothic borrowed from monuments. Others have thought it desirable that bookbinders, departing from the beaten track, should endeavour to give a more peculiar character to their bindings, a character which should mark our era; and that thus the choice of colours—more or less sombre or more or less bright—might always be in accordance with the nature of the subject treated of in the books. They contend that this system would at once afford, in a large library, the advantage of facilitating the search for books by immediately striking the eye: that it is also to be desired that certain styles of ornament should indicate whether such a work, on Egypt for example, belonged to the Pharaonic, the Arabic, the French, or the Turkish era; and that it, should be the same with ancient Greece, Byzantine Greece, or modern Greece, the Rome of the Cæsars or the Rome of the Popes.

All these suggestions may be useful if they are placed under the control of taste and judgment.

Modern bookbinding is carried on in England on a scale of such magnitude as the binders of former times could scarcely have foreseen. The production of books greatly exceeds that of any former period, and has caused the application of so much machinery to bookbinding, that it may fairly be said to have become a manufacturing business. Hooks, handsomely bound, gilt, lettered, embossed, and otherwise ornamented, no longer depend upon individual skill; but are produced with extraordinary rapidity, by the aid of machinery. Mr. Burn, of Hatton Garden, first introduced rolling-machines to supersede hammering; the iron printing-presses of Hopkinson and others were altered to form arming-presses, by which block-gilding, blind-tooling, and embossing can be effected with accuracy and rapidity. Leather covers, embossed in elaborate and beautiful patterns by means of powerful fly-presses, were introduced by M. Thouvenin, in Paris, about 25 years ago; and almost simultaneously in this country by Messrs. Remnant and Co., and by Mr. De La Rue, who were quickly followed by others. Embossed calico was also introduced about the same period, by Mr. De La Rue; hydraulic presses, instead of the old wooden screw-presses; Wilson's cutting-machines, which superseded the old plough; the cutting-tables with shears, invented by Mr. Warren De La Rue, and now applied to squaring and cutting millboards for book covers: all these means and contrivances, indispensable to large establishments, prove that machinery is one of the elements necessary to enable a binder on a large scale to carry on that business successfully.

Mr. STARR, of New York (88, p. 1488), had, in the United States Department, two machines, one for hacking, and one for finishing backs; but the Jury were not fortunate enough to see them at work, although they made many applications for the purpose.

Binding in cloth-boards is carried on with such rapidity by houses like the Remnants, the Leightons, the Westleys, and others, that 1,000 volumes can be put in cloth, gilt, in six hours, provided the covers be previously got ready, and this can be done in less than two days! Notwithstanding all these numerous improvements, the Jury could have wished for some advantages and real progress in ordinary leather bindings, where large quantities are not bound at one time. Those in the Exhibition were generally well executed; but the price is still high in proportion to that of the books, the cost of which has been much reduced by modern improvements in printing and paper-making.

France applies binding in boards chiefly to ephemeral books, which must attract the eye by their splendour, and which are intended either to ornament the drawing-room tables or to be given as prizes, and especially to books which are exported to South America. The bindings in boards exhibited by M. MAMZ, of Tours (France, 321, p. 1192), display elegance combined with a relative degree of solidity.

\* This is probably the cause which has kept us in ignorance of the names of these artists.

It is to be deplored that appearance should be so often preferred to reality, and that instead of the solidity which our fathers sought before everything, the inconstancy of our age should, by a contrary excess, prefer changeableness and variety. But, after all, books cannot be surrounded by too many attractions in order to inspire all classes with a taste for reading.

For bindings in boards a system has been for some time adopted, of employing ornaments allied by their style of design to the subject treated of in the book covered by them.

Amongst the beautiful bindings exhibited by the different bookbinders, the Jury have particularly remarked the works of the following exhibitors:—

#### BOOKBINDING—ENGLAND.

REMNANTS and Co., Lovell's Court, London (5, p. 537).—The design shows excellence and good taste; their workmanship is perfect; and in the application of carved wood to binding, by the patent mode of burning in the pattern, a great degree of beauty and cheapness, compared with carving, is attained.

J. S. EVANS, Berwick Street (8, p. 537).—An imperial 4to album, bound in vellum, illuminated by Joseph Stuart Evans, with the rose, shamrock, and thistle, intertwined and inclosed within a border of gold and colours. The interior of the book embellished with illuminated pages of various designs, and on the inside of the covers the arms of Her Majesty the Queen and His Royal Highness Prince Albert, also illuminated by the same method. The clean and superior finish of this album deserves great praise. An album in the Etruscan style, black kid inlaid upon a brown ground, the edges of the leaves ornamented to correspond. The Art Union Illustrations of the "Pilgrim's Progress," bound in morocco, finished in outline; the subject, "Christian met by Evangelist." By lines and gauges; a style of decoration totally unsuited for the purpose. The gold is well worked and bright. The whole of the binding exhibited by Mr. Evans is well executed.

Messrs. LUGHTON, of Brewer Street (24, p. 538).—These bookbinders evince, in various styles, great perfection, and all kinds of binding seem easy in their hands. Their manner of restoring fac-similes of missing pages to valuable works is first-rate. A quarto Lexicon, unfinished, showing a new mode of covering a book in such a manner as to preserve the strength of the leather at the joints. This appears to be an advantage. The taste displayed in the Royal Bible, with heavy ornaments, was inferior and of less happy adaptation to the subject than Luke Limmer's, general designs.

Mr. JOSHUA WESTLEY (48, p. 540).—Spenser's works in white vellum, a 4to Bible in russia antique, and other specimens, show excellence in workmanship.

Messrs. BOWE and SONS (52, p. 541).—Their specimens of binding attracted the attention of the Jury by the cheapness and general excellence of their cloth binding.

R. J. HAYDAY (106, p. 544) sustains his well-earned reputation in the bindings exhibited by CUNDALL and ADDEY.

M. D. BATTEN, Clapham Common, London (59, p. 541).—The books exhibited by him were elaborately worked, although requiring more careful attention in finishing.

J. WRIGHT, of Noel Street (139, p. 545).—"Das Niebelungenlied," royal 4to. A fine specimen of vellum illuminated binding, in the Grolier style, the design by an English workman. The price of binding, 10*l*. "Pugin's Glossary," royal 4to, inlaid illuminated morocco, well and expensively executed; the design taken from the contents of the book, and adapted to the decoration of the binding. The price of the binding, 10*l*. Owen Jones and Humphrey's illuminated books of the middle ages, imperial folio, dark-brown morocco, blind-tooled in imitation of the old monastic binding. The manner of fastening the leaves so as to open freely, by means of silk joints, appears superior to caoutchouc, where so large a book is required to open freely without

twisting. Price of binding, 4*l*. "Silvester's Universal Paleography," imperial folio, brown morocco; the sides beautifully and accurately tooled in the old French style, in gold. It is a first-rate specimen of forwarding, solidity, and correct workmanship. Price of binding, 4*l*. "Law's Domestic Animals of Great Britain," chastely decorated and good workmanship. "Rogers' Poems," and "Italy," specimens of rich and accurate tooling, the edges marbled and well gilt over. "Mémoires de Napoleon," royal 8vo. A specimen of emblematical binding. "Bohn's Standard Library," in calf gilt, is a fine specimen of sound, durable, and useful binding, and the price moderate, being 3*s*. 6*d*. per volume. "Bohn's Classical Library," as a revival of the English style of binding of the period of 1760, with highly-raised boards, is another specimen of superior workmanship. The whole of the specimens justify the reputation Mr. Wright has acquired.

Messrs. WESTLEY and Co., of Friar Street (111, p. 544) had, among other well-bound specimens, a royal folio Bible in purple morocco, bevelled boards, richly enlaid gilt clasps, corners, and centres. The interior of the boards worked in gold, the edges of the leaves illuminated in gold and colours in the missal style. The cost of this binding is 75*l*. The workmanship is highly meritorious, and proves that if work can be so well and elaborately executed, it is worthy of better designs.

Messrs. MACOMBE and Co., Percy Street (26, p. 53). A Cambridge folio Bible, red morocco, gilt centres in tortoiseshell, and buhl; a royal 4to Bible in russia, and numerous other specimens, showing many points of great merit, but somewhat deficient in the finishing, an error which could and should have been avoided, particularly where so much elaborate work is bestowed. The prices given are—

|  | £. | s. | d. |
|--|----|----|----|
| A Cambridge folio Bible, red morocco, elegant, gilt corners and centre, silk insides | 25 | 0  | 0  |
| A Cambridge folio Bible, tortoiseshell and buhl, silk insides, elegant               | 15 | 0  | 0  |
| A London folio Bible, morocco buhl   | 15 | 0  | 0  |
| A London, demy folio Bible, bronze and blind-tooled                                  | 5  | 0  | 0  |
| A royal 4to Bible, russia  | 6  | 10 | 0  |
| A royal 4to Bible, maroon morocco, silk insides                                      | 7  | 10 | 0  |
| A royal 4to Bible, brown morocco   | 6  | 10 | 0  |
| A royal 4to Bible, purple morocco, plates  | 5  | 10 | 0  |
| A crown 4to Bible, brown morocco, silk insides                                       | 4  | 4  | 0  |
| A crown 4to Bible, purple morocco, silk insides                                      | 4  | 4  | 0  |
| A crown 4to Bible, calf, imitation wood  | 2  | 2  | 0  |
| A crown 4to Bible, velvet-placed, gilt sides   | 8  | 10 | 0  |
| A royal 4to Prayer   | 8  | 0  | 0  |
| A royal 8vo Prayer   | 5  | 0  | 0  |
| A picas 8vo Imperial Bible, inlaid   | 5  | 0  | 0  |
| A long primer 8vo, reference   | 2  | 10 | 0  |
| A Boccaccio, vellum, illuminated   | 7  | 0  | 0  |
| A crown 4to Bible  | 7  | 0  | 0  |

Mrs. LEWIS, Duke Street (163, p. 547).—"Horne's Commentary," "Glossary of Architecture," and other works, among which was one in the Gothic style, all bearing evidence of good and careful workmanship.

Messrs. BARRETT and Co., Fleet Street (196, p. 550).—Specimens of carefully and well-executed work, among which is a royal 4to Altar Service, ultramarine border round the pages, and carved wood boards, covered in Turkey morocco: the electro-metal corners and centres deserve mention. Mr. Barrett had also numerous small Common Prayers and Church Services, perforated and engraved, solid covers, &c.

Mr. P. SAMPSON, London (85, p. 539).—An illuminated and elaborately finished 4to Bible, in red morocco, with metal edges.

Mr. TARRANT, London (43, p. 540).—The Works of Sir Thomas Lawrence, morocco illuminated, neatly bound.

Mr. NEIL, Edinburgh (91, p. 545).—An imperial 4to Bible, white morocco, super-extra, morocco inside, with satin fly-leaves, the outside of the boards and back

hand-tooled and illuminated. A fine specimen of what can be effected where care and judgment in the execution are combined, even under the disadvantages of working after a day's hard labour, this Bible having been bound in the winter evenings, by gas-light, after Mr. Neil's daily occupation.

Mr. BUDDEN, Cambridge (97, p. 544).—An Album, inlaid in colours, with interlacing band pattern, inside joints, and inlaid vellum, gilt and painted, displaying great care, skill, and taste in the execution.

Mr. OSM, London (109, p. 544).—A number of volumes neatly blocked, and a thin book under the title of "Fiddy," very neatly bound.

Mrs. LUGGISTON and SON, Harp Alley, London (158, p. 547).—Various specimens of blocking, some in silver, said to be protected from tarnishing. "The Women of the Bible," a volume showing good block-gilding.

Mr. RIVIÈRE, Great Queen Street (89, p. 543).—A volume, "Virgili Opera," royal 8vo, inlaid white morocco, inside covers tooled in foliated curves, beautifully put out of hand; "The Chronicles of England," 4to, tree-marbled calf, also a fine specimen of this style of binding.

Mr. JOHN CLARKE, of Frith Street, Soho (68, p. 541).—Sir Joshua Reynolds' "Discourses," and a folio lib in the Harleian style; a Bible in antique morocco, single hand-tooling, remarkable for its extremely well forwarded and finished style of work. Four volumes in calf, tree-marbled, in which Mr. Clarke excels.

Mr. MACNAIR, of Glasgow (117, p. 544), Mr. CLARK, of Dunfermline (68, p. 541), Messrs. CLARK and DONALDSON, of Mauchline (135, p. 545), exhibited specimens of average workmanship.

After having attentively observed the amount of elaborate work which is bestowed on most of the productions exhibited by the bookbinders of the United Kingdom, the Jury cannot disguise the fact that there is a general want of good designs; and they beg to remark that more attention should be paid to a subject which impresses a special character on the products of a country. The attempts at emblematic binding are generally not very successful; but the imitations of the old English style of bindings are a nearer approach to simple, useful, and good work.

#### BOOKBINDING—FRANCE.

M. NIÉDRÉE, of Paris (665, p. 1211), exhibited numerous works, among which several are forwarded, designed, and finished in a first-rate style. The ornamental tooling in gold is a near approach to all that can be desired.

A. LORTIC, Paris (1652, p. 1256), among other works bound in a superior manner, a large folio "Balbus de Janna," illuminated Greslier intersected pattern, with the insides elaborately gilt, is deserving of high praise. Some few specimens of very thin books displayed a degree of skill seldom surpassed.

Madame GRUEL, of Paris (857, p. 1221), exhibited a smaller number of elegantly bound books than could have been expected from her well-known establishment. Those that were in her glass-case were principally ornamented in elaborately carved wood and ivory. A large folio, "España Artistica y Monumenta," red morocco illuminated, intersected pattern, deserves commendation for its elaborate workmanship.

M. SCHLIER, of Paris (693, p. 1212): this name brings back recollections which impose duties on his successor, whose specimens contain merit of only an average kind.

M. LE BRUN (No. 906, p. 1233) and M. AUGUSTE DAUTREUILLE, of Paris (1171, p. 1233), exhibited bindings of an average description.

The Jury regret that MM. BRAUZZONNET, OTTMAN, CAPPE, and other eminent bookbinders, in Paris, have abstained from sending their works to the Great Exhibition.

In general, the bindings of French artists are remarkable for a superior degree of taste in their design, as well as for neatness of execution in the hand-tooling and finishing. Their best designs, however, are imitations of old artists.

#### BOOKBINDING—AUSTRIA.

Bookbinding on a large scale is carried on in Vienna and in Prussia, where also the manufacture of fancy leather articles has considerably increased of late years.

The principal part of the specimens exhibited were placed in M. LEISTLER's rooms, enclosed in a bookcase, and as the Jury were informed that these goods were private, there was a certain degree of delicacy in asking more than once for leave to inspect them. The names of the binders and ornamenters of the books and album-cases were not found by any number affixed to the cases, and it was not until the 20th of June that it was communicated to the Jury that the books, &c., were exhibited by individual persons who were desirous that they might not escape notice.

The designs of the portefeuilles exhibited by M. HABENICHT (376, p. 1029), bookbinder of Vienna, are by Professor CHARLES RAESNER and Professor VAN DER NULH, and show what can be accomplished when artists are employed, instead of leaving the workman to follow his own notions of what constitutes appropriate ornamentation. These portefeuilles, got up by M. Habenicht, can only be noticed in this place for the very superior workmanship displayed in gilding and ornamenting, for they do not constitute bookbinding in its strict meaning. All the portefeuille-cases in the shape of books are specimens of first-rate workmanship and appropriate design, and reflect great credit on M. Habenicht and the artists who designed them.

The following is a list of six of those elegantly finished and ornamented productions:

An elephant folio, in dark-blue velvet cover, with the figure of our Saviour and Cross, in chased silver, in the centre.

An elephant folio, green velvet, with exquisitely pierced ivory ornaments.

An elephant folio, with tortoiseshell cover, profusely ornamented with inlaid metal ornaments, Gothic design, pierced ivory and coloured glass border, silver and gilt device of three figures in the centre; the lettering in exquisitely formed raised letters of metal gilt.

An elephant folio, in blue and red morocco, illuminated in gold, with rose bouquet, and raised intersected ornaments, in ten compartments, each filled with highly finished tableaux.

An elephant folio, in dark puce velvet, raised gold ornaments, with three small ivory figures, and beautifully carved ivory ornaments round the sides.

An elephant 4to, light purple velvet, profusely ornamented with gilt metal, ebony, and pearls; females playing harp and lute in the centre, in gilt metal. Raised gilt letters, top, bottom, and sides.

M. GIRARDET, of Vienna, had also two beautiful portefeuilles, designed by Professor Charles Raesner, and of perfect workmanship. One an elephant folio, covered in light blue, red morocco tooled border, gold and ivory scroll ornaments, gilt metal centre, with female figure holding a tablet, in gilt metal, on a brown ground, with the names of celebrated Austrian music composers—perfect in the forwarding and finishing. The other, an elephant 4to, in dark-blue velvet, bronze and gilt metal, raised intersected pattern in fourteen compartments, ornamented with gold, with highly finished drawings of the costumes of Austria, and the imperial arms in the centre, in bronzed and gilt metal.

M. GIRARDET had also in the book-case upwards of 200 volumes of books, exquisitely bound. The whole of M. Girardet's productions were supposed to be with the book-case, and not exhibited for competition, and no information was afforded to the Jury to enable them to view them as a collection placed there by an exhibitor—there was neither number nor name to indicate who was the binder. Considering the superior workmanship, it is probable that M. Girardet would otherwise have received the marked approbation of the Jury by their awarding him a Prize Medal.

#### BOOKBINDING—THE ZOLLERSTEIN.

Only two bookbinders have submitted specimens, although some of the booksellers and printers, combining

this branch of the book trade, had also some bound works. M. SOMMERING, of Berlin (1 Zollv., 154, p. 1037), exhibited a large Altar Bible in morocco, well bound. M. GRAM, Duchy of Saxe Altenburg (1 Zollv., 746, p. 1091), a large Altar Bible in purple morocco; as a specimen of block gilding it is perfect, and considering the large size of the engraved block, which is stated to be in one piece, much skill is displayed in its being so skilfully applied.

#### BOOKBINDING—NETHERLANDS.

M. ROEGER, of Rotterdam (112, p. 1141), exhibited the works of Hogarth, in folio, as a specimen of binding, neatly and carefully executed.

#### BOOKBINDING—SWEDEN.

M. F. BECK, of Stockholm (104, p. 1354), exhibited ten specimens of binding, possessing fair merit.

#### BOOKBINDING—UNITED STATES OF AMERICA.

Judging from the collection in the American Department, bookbinding has not advanced in that country as much as some other branches of the book trade. The works exhibited are loosely forwarded, and twist in handling; and although much labour is bestowed in gilding and finishing, sufficient attention is not paid to the minor details on which good workmanship so much depends. The following is a list of the exhibitors:—MR. B. BRADLEY, Boston (473, p. 1465)—books in cloth, well blocked. These specimens were enclosed in a case in the form of an immense book, well and neatly covered. MR. HENRY GARNETT, Boston (420, p. 1462), and MESSRS. LIPPINCOTT, GRAMBO, and CO., of Philadelphia (57, p. 1437)—specimens of binding, of moderately good workmanship. MR. G. P. PUTNAM, of New York (122, p. 1441)—five or six specimens of mediæval binding. MESSRS. WALKER and CO., New York (123, p. 1441)—a large Ato Bible in two vols., bound in Gothic style, green morocco, gilt metal ornaments and corners, most elaborately worked fly-leaves, illuminated in green, red, and white, with recesses in each side for a family register, embellished paper, and finished in such a manner that when the recesses are shut up the inside of the cover remains even. This is the best specimen in the American Department, and possesses some novelty and care in forwarding and finishing.

#### BOOKBINDING—VAN DIEMEN'S LAND.

THE COUNCIL OF THE ROYAL SOCIETY OF VAN DIEMEN'S LAND (345, p. 999) displayed a collection of books neatly bound by MR. BOLWEGAR, of Hobart Town (196, p. 996); and one volume, said to be gilt and lettered with gold leaf from Californian gold, manufactured by MR. H. V. HOEB, also of Hobart Town.

#### Vellum Binding.

Vellum binding is a separate branch of the trade, and consists in binding all kinds of account books, from the largest ledger to the smallest memorandum book. The covers are usually vellum, forril, russia leather, smotho and rough calf, and the larger books are in general neatly worked with russia bands, which add both to their appearance and durability. The English vellum binders, whose works were in the Exhibition, fully sustain their high reputation for beauty of execution and solidity of workmanship. The ledgers of MM. GAYMARD and GERAULT, of Paris (517, p. 1203), however, show that remarkable progress has taken place in France within the last 10 years in this branch of trade. In the American Department, also, MR. HERRICK (502, p. 1466) and MESSRS. J. and W. McABRAM, of New York (482, p. 1465), had ledgers ruled in a very superior manner. An improved mode of numbering the leaves of account books has been introduced within the last few years, by means of a paging machine, patented by MR. SHAW. There are other machines for the same purpose; and MR. SOMMERING (564, p. 439) had one at work in Class XVII. during the whole of the Exhibition, which is

very simple in its construction; and appears to answer the purpose, although it may be less durable than Shaw's. MR. HANCOCK took out a patent some years since for the purpose of applying caoutchouc to the manufacture of account and other books: the leaves are fastened together with caoutchouc in a semi-fluid state, instead of stitching them, thus obtaining much greater freedom in opening when the book is bound; this appeared at first to be a superior mode, and promised to supersede all others. It was not found, however, to be sufficiently strong to sustain the severe wear and tear consequent on the constant opening and shutting of ledgers. It is a process by which books that do not require such constant handling may be bound to advantage, as they open much more freely. It appears admirably adapted for music-books, albums, small pocket ledgers, and similar works.

The English exhibitors of account books were MESSRS. THOMAS and SON, Cornhill (44, p. 540); J. WILLIAMS, of Bucklersbury (53, p. 541); EVANS, Berwick Street, (8, p. 537); HARRIS and GALAMIN, Fenchurch Street (173); ROYSTON and BROWN, Broad Street (34, p. 539); WATERLOW and SONS, London Wall (46, p. 540); COWAN and SONS (101, p. 544); DE LA RUE and CO. (76, pp. 541-543), for pocket ledgers; and MR. WONDERSPOON (159, p. 547), whose new mode of fastening the sections with cloth bands appears to be an improvement.

From France, MM. GAYMARD and GÉRAULT (No. 517, p. 1203) exhibited an immense and well-bound ledger; and M. NÉRAUDEAU (661, p. 1209), whose various account books were of an average quality. From America, MESSRS. SIBELL and MOTT, New York (339, p. 1456), in addition to those already mentioned.

#### III. PAPER.

The introduction of paper, first made of cotton, and afterwards of linen rags,\* dates from the arrival of the Arabs in Spain and Sicily, in this part of Europe, and from the time of the Crusaders as regards the Southern portion. Thus it is from two different parts of the East that we have derived this process, originally invented in China, where the art of making sheets of paper from the bark of trees, from bamboo, old rags, silk, hemp, or cotton, reduced to pulp, dates from the commencement of the second century of the Christian era.†

The use of papyrus, manufactured in Egypt, ceased in Europe about the ninth century, and the cotton paper, then in great use in the East, was introduced into Europe at this time, through the commercial relations of Venice, Naples, and Sicily.

Edrisi, who wrote in 1150, tells us that the paper made at Xativa, an ancient city of Valencia,‡ was excellent, and that it was exported to the East and West.

At the commencement of the fourteenth century there existed at Fabriano, in the Picenum, and at Colle, in Tuscany, paper-mills moved by streams of water.§ It was from these Fabriano mills that Bodoni, at the commencement of the present century, obtained the paper for his beautiful editions; and this manufacture is still carried on with success, judging from the superb vat-made paper exhibited by M. MILLIANI, of Fabriano (Rome, No. 12, p. 1285).

At Nuremberg, in Germany, a paper-mill was established in 1390.

¶ The introduction of paper-making in France dates from the fourteenth century. The towns of Troyes and Re-

\* "Ex rasuris pannorum," are the words of Peter the Venerable, Abbot of Cluny.

† Between the years 69 and 105 after the birth of Jesus Christ.

‡ Xativa is a pretty town, with castles, the beauty and solidity of which have passed into a proverb; here is made paper, the equal of which cannot be found in the whole universe. It is exported to the East and West.—(Geography of Edrisi, translated by A. Jaubert, vol. II., p. 37.) Xativa is now called San Felipe.

§ The Charter of the 6th of March 1377, relates to the lease of a mill with a waterfall, *ad faciendus cartas*.

sonnet are the first quoted in relation to this manufacture.

In England the manufacture of paper was introduced much later,\* and was imported from France. Yet it appears by verses, in a book printed in 1496 by Wynkyn de Worde, under the title of *Bartholomæus de Proprietatibus rerum*, that the paper had been made for it by John Tate, jun., at his mill in Stevenage, Hertfordshire. Probably the manufacture was not successful, for it was in 1556 that Queen Elizabeth granted to her jeweller, John Spelman, the right to erect a paper-mill, which was established at Darford: this has been erroneously stated to have been the first put to work in England. So late as the middle of the last century, only very common paper, principally wrapping, was made in Great Britain. It was not until 1770 that the celebrated J. Whatman established fine paper-making at Maidstone, in Kent, after his return from the Continent, where he had worked as journeyman in most of the principal paper-mills.

When the art of paper-making was first introduced into Europe, parchment (sheepskin), or vellum (calfskin), was used for writing and printing. In place of these substances, paper was required to possess greater strength and solidity than that made of cotton; it was therefore manufactured of hemp and linen rags, not weakened by bleaching, according to the present mode, which, by removing the natural gum enveloping vegetable fibres, injures them more or less.† It is remarkable, that these old papers, having been well-sized with gelatine, preserve their original qualities to this day.

In 1750, Baskerville, to obviate the roughness of the laid paper of that time, had it made on wove mounds; his beautiful edition of Virgil, 1757, is chiefly printed on this wove paper. This attracted the attention of M. Ambroise Didot, who employed M. Johannot, of Annonay, to make similar paper, which he called "vellum paper" (*papier velin*).‡ Until that period the rags were reduced to pulp by means of stampers, a slow process, requiring considerable motive power; to remedy this, cylinders with sharp steel blades for tearing the rags were invented in Holland, where the windmills, then used for giving power, were found inadequate to put these stampers in regular and constant motion. Holland still maintains a high reputation for its hard-sized hand-made laid writing-papers, as was shown by those exhibited in the Dutch Department.

At the end of the last century (1799), the first trial was made at Essonpes, in France, in the paper-mill of M. François Didot, of a machine for making continuous paper. It was the invention of M. Robert, a workman in that establishment, who obtained a patent for 15 years, and a sum of 8,000 francs from the French Government. Some sheets of paper in continuous lengths were then made; but the troubles in which France was involved at that time caused delay in the necessary experiments, which were both tedious and expensive. As soon as the Peace of Amiens restored intercourse with England, M. Didot, jun., convinced of the great utility of the invention, came over with it to seek in England what was then wanting in France—capital engineers and enterprising paper-manufacturers; he was accompanied by Mr. John Gamble, his brother-in-law, who had resided several years in Paris. Having obtained patents in England, one in 1801, and the other in 1803, they were assigned to Messrs. Henry and Sealy Fourdrinier in 1804. Dartford, in Kent, was selected as the place best adapted for realising the patentees' plans, and Mr. Hall's establishment as the fittest engineering concern for that purpose. In that manufactory, Mr. Bryan Donkin, since so celebrated as a paper-machine maker, was employed; and to this gentleman the credit of perfecting the paper-machine is mainly due. In 1803, after intense application, Mr. Donkin produced a self-acting machine, or

working model, which he erected at Frogmore, in Hertfordshire; and in 1804, he put up the second machine at Two Waters, which was completely successful; and the manufacture of continuous paper became one of the most useful discoveries of the age. In the first ten years from 1803, Messrs. Donkin made and set to work 13 paper-machines; in the second ten years they put up 25; and in the present year, 1851, Messrs. Donkin and Co. are making their 191st machine. Of these 83 have been made for Great Britain, 23 for France, 46 for Germany, 22 for the North of Europe, 14 for Italy and the South of Europe, 2 for America in 1826, and 1 for Mr. Marshman, for India, in 1825. The first machine made by them for France was sent to M. Canson, in 1822; the second, in 1823, to M. Maupeau; and the third, in 1825, to M. Didot. The first machine made by Messrs. Donkin for Germany was in 1818, for the Prussian Government, sent to Berlin; the second, in 1823, for Mr. Rauch, of Heilbronn. The first machine sent to Russia was in 1835, for Moscow. In 1837, one for the Bank of Poland, sent to Warsaw. In 1805, Mr. Donkin altered the position of the cylinders, so as to dispense with the use of the upper web, an improvement by which the machine was much simplified—the paper on the web being slightly pressed before passing through the pressing rollers—thus an all-important advantage was attained.

In 1809, Mr. Dickinson, paper-maker, invented another method of making endless paper. It consists in causing a polished hollow brass cylinder, perforated with holes or slits, and covered with wire-cloth, to revolve over and in contact with the prepared pulp; the cylinder being connected with a vessel from which the air has been exhausted, the film of pulp adheres to the hollow cylinder. It is then turned off continuously upon a solid one covered with felt, upon which it is condensed by the pressure of a third revolving cylinder, and is thence delivered to the drying-rollers.—See Ure's Dictionary, article *Paper-making*. In 1826, M. Canson, of Annonay, first applied suction-pumps to the Didot and Fourdrinier machines. He kept it secret for six years, and in 1832, communicated it to Messrs. Wyse and Middleton.

In 1836, Mr. Brown, of Esk Mills, near Edinburgh, obtained a patent for applying suction-pumps to the Fourdrinier machine. He places a rectangular box transversely beneath the horizontal wire-cloth, without the interposition of any perforated covering.

In April 1839, Mr. T. B. Crompton took out letters-patent for producing a partial and continual vacuum under the wire by means of a fan; and a uniform rarefaction is obtained by this arrangement. It has been successfully applied since that period at his extensive mills, Farnworth, near Bolton, Lancashire.

The first machine for continuous paper actually made in France was constructed at Sorel, near Anet, by Messrs. Berte and Grévenich, under the directions of M. Didot, who had obtained a patent in France. M. Calla, an ingenious French mechanic, was the maker. The machines first made in France were very inferior to those made by Messrs. Donkin; consequently he supplied the principal paper-makers in that country with machines made by him in England.

Notwithstanding the great benefits derived by the perfection of the Didot and Fourdrinier paper-machines, and the immense quantities of paper produced by these machines, it was not till 1821 that the advantages of this invention were fully developed. This was effected by Mr. T. B. Crompton, who took out a patent on the 1st of November 1820, for "drying and finishing paper by means of a cloth or cloths, against heated cylinders, and the application of a pair of shears to cut the paper off into suitable lengths, as it comes from the machine or rollers." The old tedious and expensive process of drying in lofts was no longer necessary. The paper was much better finished and cut than had been found possible until this improvement. Through the imperfection of the patent laws of that period a number of persons eventually succeeded in setting aside Mr. Crompton's patent.

In 1828, Mr. T. B. Crompton, in conjunction with Mr.

\* See the argument of De Thou, in favour of the 24 sworn bookellers.—*Parliament Records*, 17th January 1584.

† The first specimen is in one of the volumes of the collection which he printed for Mons. le Comte d'Artois (Charles X.).

Enoch Taylor, obtained a "patent for cutting paper longitudinally, by means of revolving circular blades."

In 1826, Mr. Firmin Didot introduced into his mill, at Meunil, Mr. Crompton's drying process. This was the first time that it was put into operation in France.

Fine writing-paper is now made, sized with gelatine, dried, and cut into sheets, at the rate of 60 feet a minute in length, and 70 inches in width, at the works of Mr. William Joynson, at St. Mary Cray, Kent, which produces, from only two machines, the large quantity of 25 tons per week.

The paper used in England for newspapers is required to be very strong and firm: to obtain these qualities it is sized with gelatine. To Mr. T. B. Crompton is due this mode of sizing with rollers. The amount of Excise duty on paper made by him has been no less than 15,000*l.* per annum, taking an average of ten years, and now exceeds 20,000*l.*, giving the enormous weight per annum of 1,400 tons.

In August 1830, the late Mr. Thomas Barratt, of St. Mary Cray, obtained a patent for inserting the watermark and maker's name to continuous paper, so as to resemble, in every respect, paper made by hand. It is to this ingenious man that we are indebted for the improved means of finishing paper, owing to the perfection he attained in making cast-iron rollers truer than was possible by the old mode of turning them in a lathe. This consists in grinding the rollers together, allowing merely a small stream of water to flow over them, without emery or any other grinding material; and, by continuing the operation for many weeks, true cylinders are obtained. This is the mode now adopted in finishing rollers for all purposes requiring great accuracy.

In August 1831, M. Jean Jaques Jequier obtained a patent for making continuous paper with wire marks, similar to the laid papers usually made by hand; to which the preference was still given for their greater strength and peculiar appearance.

In 1830, Mr. Ibotson, of Poyle, paper-maker, obtained a patent for a peculiar construction of strainers. He intrusted the getting up of these strainers to Messrs. Donkin, who used great care in their manufacture. By Mr. Ibotson's simple contrivance, the sand, lumps, knots, and other impurities, are kept from flowing with the pulp at the moment of its running on the wire web on which the paper is formed. Most countries have since adopted these strainers; and paper is now free from the imperfections which formerly caused so much damage to types in the printing, spoiling large founts and valuable woodcuts, after they had been in use only a short time: this great improvement also superseded the operation of picking the lumps, &c., after the paper was made, which caused so much retree (damaged paper) to otherwise good and well-made paper. Other kinds of strainers are used; but few are found to work as well as Ibotson's, made by Donkin and Co. Mr. John Wilks, a partner in the firm of Donkin and Co., obtained a patent in 1830 for a channelled and perforated roller, technically called a "dandy," to remove part of the water from the pulp, to facilitate couching, to enable paper to be made with increased rapidity, and to close its upper surface. To this gentleman manufacturers are greatly indebted for many valuable suggestions and improvements in the numerous utensils and implements required in the making and finishing of paper.

In England, writing-papers are sized with gelatine, and are stronger and harder than those of other countries: they are also clearer, generally better put up, and show greater care in the manufacture than those of France and of other countries. The old cream laid papers, now so fashionable in England, were re-introduced by Messrs. Hollingworth, of Turkey Mill, Kent, a few years since, and they are still preferred for letter and note paper. The thinnest post writing-papers, however, are much better manufactured in France, Belgium, and other parts of the Continent than in England. Those exhibited from Angoulême in France, and Heilbronn in Germany, are the best; those made in Belgium are not sufficiently strong. Notwithstanding the high protective duty of 1*l.* per 100*l.*, a considerable quantity of these thin

writing-papers is imported into England. The white of the letter-papers of France, Germany, and other foreign countries, is of great purity and beauty; and these papers, being sized in the vat with farina, in addition to rosin-soap, instead of gelatine, they are less greasy under the pen,\* and consequently can be written on more freely than those which are sized with animal size; they do not, however, bear the ink so well. English printing-papers generally maintain a superiority over those of foreign countries; and in drawing-papers and strong account-book blue-laid papers, England stands unrivalled. Tinted printing and drawing papers, formerly made exclusively in England, are now produced by most foreign paper-makers, who also make the tinted writing post-papers, long out of fashion in this country. M. Obar, of Prouzel (334, p. 1193), exhibited well-made black papers, for wrapping, cambrics, lace, &c. Black papers of the same kind were made in Ireland and Manchester more than 25 years ago.

M. JOURNET (619, p. 1207), of the Souche Paper Manufactory, exhibited printing-paper of a good colour, said to be bleached without the use of any acid; rose-colour tissues of great brilliancy, dyed with safflower, and filtering-paper for chemical purposes, which, probably owing to the granitic and silicious soil through which the Souche waters flow, seem to combine all the best qualities of the Swedish paper originally manufactured under Berzelius' directions. A sheet of M. Journet's filtering-paper, weighing 9.6970 grammes, and having a surface of 0.2336 mètres, analysed by M. Bareswil, gave in ashes only 0.0293; so that 100 kilogrammes of this paper would yield only 302 grammes of ashes, being only three parts of ashes from one thousand parts of paper—a very favourable result.

The so-called "fire-proof cartridge-paper," made with animal substances invented by M. Mérieux, and exhibited by MM. ODENT (938, p. 1225), BLANCHET, and KLEBER, of Lèves (1090, p. 1230), and by M. MONTGOLFIER, of Annonay (324, p. 1192), deserves particular mention. It approaches parchment in strength and solidity, and is valuable when used instead of felt in making gun-cartridges; for should it catch fire, the fire does not spread as in paper, but goes out instantly. M. Odent was the first to apply M. Mérieux's invention under that gentleman's instruction, and he exhibited sheets as a substitute for parchment-binding, or for valuable records; its yellow colour, however, is objectionable, but it may perhaps be improved. M. Montgolfier has also applied this animal paper, instead of parchment, to the use of spinning-mills and to gold and silver beaters' purposes.

Sizing in the vat offers many advantages, but as a gelatine cannot be employed without injury to the felt during the process of manufacturing paper, substitutes for gelatine were desirable; and in 1827 M. Canson made size, of which wax was the base, and M. Delcambre made another, the base of which was rosin: neither seems to have answered the purpose, for Mr. Obry's plan of using alum and rosin, previously dissolved in soda, and combining it with potato-starch, which he adopted in 1827, is the method now generally followed in France for writing and printing papers. In England, for printing-papers, the rosin size is also the one in use; the addition of potato-starch has been attempted, but not very successfully, probably from the quantity of cotton rags used, which seem not readily to take the size made with starch. For writing-papers, gelatine is still preferred in this country, and is an after process.

#### Glazing of Paper.

High glazing, now universally adopted, was first introduced by the late Mr. Heath, about 35 years ago, at his pasteboard manufactory in Hackney, and for many years the means he adopted were not known. On the introduction of steel pens, there was an increased demand for smooth papers, and a desire to obtain the highest possible finish. Other card and drawing-board makers applied

\* Mr. Joynson since the Great Exhibition has remedied this inconvenience by a very ingenious process.

Mr. Heath's process, and it became the custom for wholesale stationers to send post and other writing papers to the card-makers to be glazed or satined. A patent having been granted in 1833 to Mr. De La Rue for "certain improvements in playing-cards," in which he applied printing in oil, instead of the old way of stenciling with water colours, he adopted the mode of passing them between copper sheets through powerful rollers, instead of the usual mode of glazing by friction with a flint, and subsequently he attained a higher finish in fine writing-paper than had hitherto been effected by submitting it to the same process.

Glazing is now carried on at most of the paper-mills, in all countries. Writing-papers have also been glazed in long lengths; but as the naked rollers through which the paper passes become indented after having been only a short time in use, this plan has been abandoned. A better mode is to pass the paper several times through a calender, having an iron roller at the top and bottom, and a paper roller in the middle, the iron rollers being slightly heated by steam. This plan is useful where cheapness is necessary; but it is nevertheless an inferior sort of glazing, and does not long maintain its gloss. It has been practised many years by Mr. Crompton for strong brown packing-papers. The WEARMOUTH PAPER COMPANY (149, p. 546) exhibited, through Messrs. Verblancs, a fine specimen of brown paper glazed in long length; and Messrs. DREWSEN and Co. (Denmark, 4, p. 1355, 1356), of Silkeborg, in Jutland, Denmark, have exhibited a large roll of cream-laid writing-paper well glazed, *not satined*, in long length. There is no difficulty whatever in glazing paper in long lengths, provided care be taken to obtain very true rollers. A thin doctor-blade should be fixed in a proper position to detach the sheets as they pass through, as the electricity which is developed causes them to adhere to the cylinders, particularly where rosin size has been used.

#### *Paper Bleaching.*

At the end of the last century, M. Berthollet's discovery of the means of bleaching with chlorine was successfully applied to paper-making; and by this valuable process coloured rags, ropes, &c., were converted into fine white paper, but the improper use of it deteriorated the quality, and recourse was therefore had to the use of chloride of lime, and to a better system of washing the pulp, for which purpose washing drums were introduced by Mr. Breton, and perfected by Messrs. Blanchet and Kleber. As a further precaution against the deteriorating effects of the use of chlorine or its compounds, some makers use anti-chlor, such as sulphites, to neutralize the small particles which might still remain in the pulp after bleaching and ordinary washing.

The rotatory rag-washing machine, invented by Messrs. Donkin, has the advantage of enabling the boiling operation to be performed under high pressure: the mechanism continually lifting the rags out of the lye and plunging them back insures complete and uniform action. The lye may be used repeatedly by adding fresh doses of alkali. M. Journet has adopted the plan long followed in England of using the waste wash-water of his mills for manuring land.

The chloride of lime is cheaper in England than in France; it is made principally at Glasgow as a secondary product of the soda manufacture; the price is 14s. per cwt. (about 30 fr. the 100 kilogrammes), whilst at Rouen or Paris it costs 47 fr. the 100 kilogrammes, being 56 per cent. dearer, a disadvantage to which the French manufacturer is subjected on one of the most important raw materials used in paper-making, as the importation of chemical productions is prohibited in that country. The difference of price is from the great disparity in the cost of fuel; coals are sold in England at an average of 4s. per ton (5 fr.) in London 15s., or 18 fr. At Rouen, coals cost 35 fr. per 1,000 kilogrammes, to which must be added the cost of cartage to the different mills.

#### *Paper.—Motive Power.*

The use of steam as a motive power has become almost universal in England, Holland, and Belgium, where there

are fewer waterfalls than in France and other parts of the Continent. Although steam is more expensive than water power, it is more available, and mills using it are not subject to stoppages from floods and shortness of water.

In France and other countries where mills are near large forests, it is cheaper to use wood than coal; but England has great advantages from the cheapness of its fuel, particularly for steam drying. Where mills are in unfavourable situations, without coal, the cost of drying the paper is considerable.

England and France obtain the greater quantity of manganese from Germany; the price of which is therefore about the same in both countries. Rosin is imported from America and Russia, and some is produced near Bordeaux. Alum and potato-starch are about equal in price in England, France, and Germany. Muriatic acid is dearer in England than in France, where the price is now very much reduced.

#### *Paper.—Price of Labour.*

Although the price of labour is, in general, higher in England than on the Continent, yet owing to the care and skill of the English workmen, and the great superiority of the machinery employed, it is doubtful whether the cost of the manufacture of paper be not as cheap in England as in other countries. To ascertain the merits of the manufactures, quality and price of the paper being considered, it would be necessary to have exact data as to the rate of labour in different countries, and given in each locality, as the price varies according to the greater or less distance of the mills from the capital; for example, in France the price of labour in the Vosges is much less than near Paris, but this advantage is counterbalanced by the expense of carriage, which is always greater in the case of mills distant from the centre of consumption. These points have been considered by the Jury according to the best information obtained, and they find that mills established where civilization has made little progress are the most favourably circumstanced. The price of rags mainly regulates that of paper, and the value of rags is always in proportion to the degree of civilization and prosperity of the country. Thus Smyrna, which some years ago converted its rags into coarse boards, and sold them to the paper-makers of Europe for making paper, now makes good writing and other papers, the low price of which proves that both the raw materials and the labour must be cheap in that part of the world.

In proportion to the progress of civilization, paper-machines have been introduced into the different parts of the world. North America possesses a great number. South America has now begun to obtain them from the United States. In Africa there is only a small vat-mill at Boulac, near Cairo.

The following is an account of the number of paper-mills in England, Scotland, and Ireland, and the number of beating-engines employed: also the amount of duty charged on paper, the quantity imported from various countries, and the amount exported from Great Britain in the year 1850.\* (See Table, p. 430.)

By a Parliamentary paper, published March 9, 1852, the number of paper-mills at work in England on the 18th February, 1852, was 304 in England, 48 in Scotland, and 28 in Ireland, making 380. There were 1,616 beating engines at work, and 130 silent.

Sharp, in his "Gazetteer," ed. 1852, p. 977, states the number of paper-mills to be 800, employing 30,000 hands; but the Table (p. 430), obtained officially from the Inland Revenue Office, gives the number of mills as being only 415, including England, Scotland, and Ireland.

The amount of duty charged in the year 1850, shows the enormous amount of 62,360 tons weight of paper produced in Great Britain in one year! The first paper-machine was erected in 1804.\*

\* Anderson, in his "History of Commerce," states, that it was in 1690 that paper was first manufactured in England; until that period France exported paper to England to the amount of 100,000l. yearly.

|   | England.    | Scotland.  | Ireland.  |

| 1844   | 299                | 302            | 48                 | 25             | 23                 | 32             | 370                | 359            |
| 1845   | 310                | 309            | 50                 | 25             | 24                 | 30             | 384                | 364            |
| 1846   | 308                | 328            | 51                 | 22             | 25                 | 28             | 384                | 378            |
| 1847   | 320                | 326            | 54                 | 20             | 31                 | 27             | 405                | 373            |
| 1848   | 321                | 321            | 54                 | 21             | 32                 | 25             | 407                | 367            |
| 1849   | 319                | 310            | 55                 | 19             | 32                 | 24             | 406                | 353            |
| 1850   | 323                | 307            | 57                 | 19             | 32                 | 18             | 412                | 344            |
| 1851   | 322                | 296            | 58                 | 19             | 33                 | 15             | 413                | 330            |

Inland Revenue Office, Old Broad Street,  
14th October 1851.

The annual value of paper manufactured in this country is said to be two millions sterling.—*Vide* "Sharp's Gazetteer," 1852.

The following is a list of the principal sizes of writing-paper in English inches, and in French centimètres, to the nearest millimètre or tenth of a centimètre, which will be found useful to stationers and all connected with the paper trade:—

|                       | Inches.   | Centimètres. |
|-----------------------|-----------|--------------|
| Double elephant - - - | 40 - 28½  | 101·6 - 67·9 |
| Atlas - - -           | 34 - 25   | 86·4 - 66·0  |
| Colombier - - -       | 34 - 23½  | 87·6 - 59·7  |
| Imperial - - -        | 30 - 22   | 76·2 - 55·9  |
| Elephant - - -        | 28 - 23   | 71·1 - 58·4  |
| Super-Royal - - -     | 27 - 19   | 68·6 - 48·3  |
| Royal - - -           | 24 - 19   | 61·0 - 48·3  |
| Medium - - -          | 22 - 17½  | 55·9 - 44·4  |
| Demy - - -            | 20 - 15½  | 50·8 - 39·4  |
| Large post - - -      | 21 - 16½  | 53·3 - 42·5  |
| Small post - - -      | 19 - 15½  | 48·3 - 39·4  |
| Foolscap - - -        | 16½ - 13½ | 41·9 - 33·7  |

NOTE.—These are drawing and writing paper sizes—printing-papers are of different dimensions.

With rags produced by a population of 27½ millions of inhabitants in Great Britain and Ireland, and notwithstanding the large quantities of bagging and other descriptions of lines and cotton whippers, old sails, cordage and old navy stores, &c., England imports from foreign countries a quantity of rags, amounting annually to 8,134 tons, at the following table shown:—

AN ACCOUNT of the Quantity of OLD RAGS, OLD JUNK or ROPES, or OLD FISHING NETS, fit only for making Paper or Pasteboard, Imported into the United Kingdom in the Year 1850, showing the Countries from which Imported.

| Countries from which Imported.                | Quantities Imported into the United Kingdom in the Year 1850. |

The waste\* of the Manchester cotton-mills, and that of the spinning-mills in England, Scotland, and Ireland, produces enormous quantities of material, which is now skillfully applied to paper-making, and, when mixed with rope, bagging, &c., produces strong and good paper for most purposes.

Of the large number of paper-makers in Great Britain and Ireland, a few only have exhibited, namely:—Mr. JOYNSON, of St. Mary Cray, Kent (42A, p. 540), who exhibited a large assortment of blue wove, blue laid, large bank post, cream laid post, blue laid post, and cream laid foolscaps; the  $\frac{5}{8}$  lb. thin large bank post, in imitation of the French *pélure*, was not equal to that exhibited by the French manufacturers, although a nearer approach than any yet made in England of that weight. The post and other papers were all of high qualities, fully maintaining Mr. Joynton's reputation as a first-rate manufacturer. Mr. DEWDNEY, of Collampton, specimens of excellent cream laid writing-papers, and also some unchangeable blue papers of superior manufacture for the use of starch-makers. Mr. SAUNDERS, of Dartford (36, p. 539), strong parchment paper, for printing shares, and other purposes where great strength and tenacity are required; plain and coloured bank-note papers, of strong texture, with a variety of water-marks of elaborate and complicated designs; white and coloured safety papers, for printing bankers' cheques, letters of credit, &c., detecting the removal of writing by chemical reagents, and some specimens of a new method of making papers with water-marks, giving gradations of light and shade: the whole of these papers were of excellent qualities and make. Messrs. COWAN and Co., of Edinburgh (101, p. 544), a variety of printing, writing, note, and letter papers. Mr. WILLIAM WILDES, of Soodland, Rochester (102, p. 544), some specimens of writing-papers, with wreaths of flowers in the water-mark. Messrs. HANCKS BROTHERS, Chesham (96, p. 544), patent writing-papers with ornamented water-mark. Mr. CHARLES VENABLE, Clifden and Soho Mills (149, p. 546), specimens of well-made and fine quality plate, lithographic, and printing-papers. Mr. GEORGE VENABLE, strong and good wrapping-papers (149, p. 546). Mr. EDWARD SMITH, Gateshead, strong brown paper, manufactured by Messrs. Thomas Gallon and Co. Mr. LAMB, of Newcastle (147, p. 546), pottery tissues, of excellent quality. Mr. FOURDRINER (100, p. 280), also had some pottery tissues, of good quality, in Class VI. Mr. ALFRED HAMER, of Horsforth, Leeds, &c. (84, p. 543), press papers, for pressing woollen cloths; and brown papers, rolled and glazed, of good qualities. Messrs. HASTINGS and MELLER (85, p. 543), brown paper, glazed and unglazed; and press papers, of good qualities. Messrs. WHITELEY and Sons (98, p. 544), produced some fine specimens of press papers. Messrs. VENABLES, WILSON, and TYLER, of Queenhithe (149, p. 546), and Messrs. SPICER (42, p. 540), of Bridge Street, wholesale stationers, enabled the Jury to ascertain the state of the paper trade in this country, by the ample and varied specimens which those houses have submitted to public inspection in Class XVII. Messrs. DE LA RUE and Co. (76), as paper finishers, displayed every description of the best writing-papers produced in England, thus affording the means for judging of the high state of finish which this important branch of manufacture has reached in Great Britain.

\* The quantity of cotton-wool imported in 1845 was seven hundred and twenty millions and a half pounds weight; above one thousand tons of raw cotton are required for daily consumption. In 1850, one million eight hundred and twenty-two thousand hundredweight of flax was imported. Linen and flax are spun to the value of ten millions sterling annually.—*Vide "Sharp's New Gazetteer,"* edit. 1852, p. 976. Chevalier Clausen's discovery of flax-cotton, which promises to extend the growth and manufacture of flax, cannot fail greatly to increase the best description of raw material for paper-making. In 1775, a description was given by Lady Maitland, and published in the *Transactions of the Society of Arts* in 1783, of a new method of reducing flax to a fine fibre by means of an alkaline solution: the specimens were retained by the Society.

### Writing-Papers in Packets.

Immediately after the introduction of the penny postage\* in this country, there was an immense increase in the consumption of letter and note paper, and a total change in the sizes was required. Until 1839, 4to letter-paper was put up only in half reams, and retailed in loose quires or single sheets, at prices varying from 6d. to 1s. per quire. Very superior letter and note papers are now sold in neat and convenient packets at from 1s. to 2s. 6d. per five quires. The patent cutting-machine of the late Mr. George Wilson proved a powerful auxiliary in enlarging the sphere of this branch of the paper-trade, by accelerating one of its simplest operations, cutting in letter and note size. Without its aid it would have been scarcely possible, by hand labour alone, to supply the daily increasing demands of society for note-papers since the introduction of the cheap postage. This is one of the innumerable common-place instances which show that the full importance of machinery in the commercial progress of the community is not duly appreciated, unless time and quantity are taken into the estimate as well as difficulty. It is to Messrs. De La Rue that the few sizes and improved mode of putting up paper in convenient forms are due. The quantity and variety exhibited by them and others are evidence of the encouragement given by the public to this ornamental mode of packing letter and note papers, for each size of which envelopes are made to suit.

The following exhibitors also displayed writing-papers in packets, viz. :—

Messrs. DOBBS and Co., London (79, p. 543); Messrs. COWAN, of Edinburgh (101, p. 544); Messrs. SPICER BROTHERS (42, p. 540); and Messrs. VENABLES, WILSON, and TYLER (149, p. 546).

Foreign manufacturers have adopted the mode of making up letter and note paper in ornamental packets, and they have exhibited a variety of good specimens, among which were—

*France.*—M. MARION (609, p. 1207), M. BEAUFORT (1084, p. 1230), and M. VALANT, of Paris (1514, p. 1249).

*Belgium.*—MM. GODIN and SON (284, p. 1160), and M. TARDIF (281, p. 1160), of Brussels.

*Zollverein States.*—M.M. SCHAEFFER, OTTO, and SCHNIDE, of Berlin (1 Zollv., 153); M. C. A. KOCH, of Gladbach, near Mulheim, on the Rhine (1 Zollv., 329); MM. HOESCH and SON, Duren (1 Zollv., 392, p. 107); M. L. SCHUELL, of Duren (1 Zollv., 393, p. 1072); M. PIETTE, of Dillingen (1 Zollv., 394, p. 1072).

\* PENNY POSTAGE.—The following is an estimate of the number of chargeable letters delivered in the United Kingdom in each year from 1839 to 1851 :—

| Years. | Number of Letters. | Annual Increase.   |   |
|--------|--------------------|--------------------|---|
|        |                    | Number of Letters. | Percentage reckoned on the Number for 1839. |
| 1839   | 76,000,000†        | —                  | —   |
| 1840   | 169,000,000        | 93,000,000         | 123 per cent.                               |
| 1841   | 196,500,000        | 27,500,000         | 36 "  |
| 1842   | 208,500,000        | 12,000,000         | 16 "  |
| 1843   | 220,500,000        | 12,000,000         | 16 "  |
| 1844   | 242,000,000        | 21,500,000         | 28 "  |
| 1845   | 271,500,000        | 29,500,000         | 39 "  |
| 1846   | 299,500,000        | 28,000,000         | 37 "  |
| 1847   | 322,000,000        | 22,500,000         | 30 "  |
| 1848   | 329,000,000        | 7,000,000          | 9 "   |
| 1849   | 337,500,000        | 8,500,000          | 11 "  |
| 1850   | 347,000,000        | 9,500,000          | 12 "  |
| 1851   | 360,500,000        | 13,500,000         | 15 "  |

† The estimate for 1839 is founded on the ascertained number of letters for one week in the month of November, and, strictly speaking, it is for the year ending December 31, at which time 4d. was made the maximum rate. The estimate for each subsequent year is founded on the ascertained number of letters for one week in each calendar month.—(*Vide Return to the House of Commons, No. 876, 1851.*)

*Grand Duchy of Wurttemberg.*—M. SCHAEFFELIN, Heilbrunn (4 Zollv., 41, p. 1117).

*Russia.*—MM. VARGOUNIN BROTHERS, St. Petersburg (305, p. 1375).

#### PAPER-MAKING—FRANCE.

France, besides importing yearly from America 155,000,000 lbs. of cotton, and ultimately converting a large portion of this into rags, the export of which commodity is forbidden by the French law, is also in a favourable position with regard to other raw materials, such as hemp and linen rags. Unfortunately, the introduction of strong alkalis, used in washing in large towns, greatly deteriorates, there and elsewhere, the materials for paper-making.

The northern countries, where hemp and flax are abundant, are in general favourably situated with regard to the quality of the rags.

There was in the Exhibition a species of paper made in the Sandwich Islands, from vegetable substances, retaining the original strength and flexibility of the raw material.

Every fibrous plant is capable of being converted into paper. Many attempts have been made in this and other countries to use the bark of trees, straw, and similar substances for that purpose, but the great waste and expense in converting these substances into pulp have hitherto precluded their use in large quantities. Should, however, rags become so scarce as greatly to enhance their price, recourse might be had to the use of raw materials, such as the dwarf banana, the dwarf palm, the aloe, white wood, and even straw. But it would still be necessary to mix these materials with rags to lessen the transparent appearance of paper made entirely of such substances, as was evident in that exhibited by M. GRATIOT, made at the Essonnes paper-mill.

At the French Exhibitions of 1839 and 1844, there were specimens of paper made with the leaves of the banana-tree and similar plants, but the experiments then made showed great waste in converting them into paper. With a view of reducing the cost of carriage, by freeing the substances from foreign matter, M. Rocques established powerful works at Havannah, to wash and convert them into pulp for the European markets; but even in this state the absolute necessity of strong bleaching caused a waste of more than one-third of the original weight.

M. FLECHET (34, p. 1261) exhibited in the Algiers Department of the Great Exhibition specimens of paper made of the dwarf palm (*Chamærops humilis*), which abounds in that country, and of which he states that four millions of hundredweights could be obtained every year, at a trifling cost, by causing it to be gather'd by women and children, so that it might be had for two francs the two hundred pounds; and he contends that if beaten into half-stuff whilst in its green state, it would yield 36 per cent. of its weight, and dry, 50 per cent.; and that two hours' beating would be sufficient to render this half-stuff fit for making fine paper.

M. Didot states that there are 200 machines in France, producing each 700 kilogrammes per day, or 195 tons each per year, making a total of thirty-nine thousand tons, and 250 vats, producing over two thousand tons more per year, being a gross amount of forty-one thousand tons.

The first paper-machine was established in France in 1815.

The following is a list of the French paper-makers who have exhibited, viz.:—MM. LACROIX, of Angoulême and Paris (1638), superior writing-paper. MM. ODENT, SON, and Co., Courtaigne (Seine-et-Marne) (388), machine and vat-made writing and printing papers. MM. BLANCHET BROTHERS, and KASSAN, Rives (Isère) (1090), white and tinted writing and printing papers. MM. CALLAUD-BELGEM and Co., Angoulême (788), writing papers for ledgers, post paper, drawing and tracing papers; the

latter of excellent quality. M. G. DE SEALAY, Gueurs, Seine Inférieure (1484), various sorts of paper. M. E. DOUMMAC, Jouy, St. Morin (Seine-et-Marne) (822), printing, lithographic, and plate papers, drawing and writing papers, strong paper for vouchers and bank-notes. M. A. GRATIOT, of the Essonnes paper-mills (854), tissue-paper made from the banana-tree; writing-papers. THE JOINT STOCK COMPANY OF THE SOUCHES (377), writing, printing, staining, filtering, and imitation India papers: the filtering-paper of superior quality. MM. MONTAIGLIER, of Annouay and Paris (324), drawing, writing, and printing papers, animal papers, &c. MM. ORRY, BERNARD, and Co., Prouzel, Amiens (334), drawing, writing, printing, and other papers. M. FLECHET, of Algiers (24), a specimen of paper made from the dwarf palm-tree.

#### TABLES showing the IMPORT and EXPORT OF PAPER, RAGS, &c., in FRANCE.

##### EXPORTATION 1849.

## 3. PAPER-MAKING—BELGIUM.

Though several unsuccessful attempts had been made before the seventeenth century to introduce the manufacture of paper into Belgium, it was only towards the end of that period that it was regularly established in several provinces, with exclusive privileges granted by the Government. Its progress was not rapid during the eighteenth century; but during the last thirty years it has been so much developed that Belgium has nearly ceased to import writing-paper from France, and printing-paper from Holland, and has lately considerably increased its exports of first-rate paper.

The following is a statement of the paper exported from Belgium in 1849, with the countries to which it was sent; the total amount being 36,040.

|                                     |         |

|                 |                     |         | <u>900,997</u> |

The importations of rags and other material for paper-making into Belgium, in 1849, amounted to only fourteen tons and a half.

In 1849, Belgium imported paper from the following countries to the amount of 69,343 francs (2,774l.):—

|                                 |               |

MM. GODIN and SON, of Huy, Liège (284, p. 1160), displayed an extensive collection of every description of drawing, writing, printing, and packing papers; some drawing-papers in long lengths, well made, and hard-sized. They were the only paper manufacturers from Belgium who exhibited. From the Netherlands, MM. HONIG, of Zaandijk (59, p. 1145), exhibited double elephant paper, of excellent quality; and MM. VAN GELDEN and SONS, of Wormerveer (61, p. 1145), some specimens of excellent paper and white paper, white inside and purple outside, machine made, for the use of sugar refiners.

Rome.—M. MILIANI (12, p. 1285) exhibited specimens of drawing and plate papers, of excellent quality.

Denmark.—MM. DREWSEN and SONS, of Silkeborg, Jutland (4), exhibited specimens of writing-paper, milled in long lengths, stated to be by a new process. The finish is not equal to the highly-glazed papers called *satined*, but as *mull-glazed* the specimens were good.

## PAPER-MAKING—THE ZOLLVEREIN STATES.

The manufacture of paper has rapidly increased in the German Zollverein within the last few years. The States not only now produce paper sufficient for their own con-

sumption, but also for exportation. Rags are largely imported from other countries. The average yearly consumption of rags is said to be four pounds per head of the entire population, as proved by manufacturers who collect their rags within certain districts; this statement seems to be corroborated by its corresponding with the amount of the actual consumption of linen and cotton. The Zollverein, according to the last census, had a population of 29,649,330 souls. In 1850, the weight of rags made into paper in the German Zollverein was between 1,180,000 and 1,190,000 cwt. This shows the great activity in the manufacture of paper in these States. In the Prussian provinces of Silesia, Saxony, Westphalia, the Rhine provinces, and also Brandenburg, both Hesses, the kingdom of Saxony, and many of the other States of the Union, large quantities of paper are produced. There are 794 paper-mills, having 116 paper-machines, which, at an average of 700 kilogrammes of paper per day, give 36,964 tons per year. It is an important fact that in the Zollverein the finer and better sorts of paper are produced, and part exported, whilst the common paper is imported. The proportion, according to the average of the years 1843 to 1845, and 1846 to 1848, will be best understood from the following table:—

|                                   | Quantity, per Cwt. |                     |          |                     |          | Value, (Prussian Dollars). |          |                     |          |
|-----------------------------------|--------------------|---------------------|----------|---------------------|----------|----------------------------|----------|---------------------|----------|
|                                   | Price per cwt.     | Average of 1846-48. |          | Average of 1843-45. |          | Average of 1846-48.        |          | Average of 1843-45. |          |

| Total -                           | -                  | -                   | -        | -                   | -        | 9,136                      | 270,589  | 8,048               | 256,558  |
| Excess of Exports -               |                    |                     |          |                     |          | 261,453                    |          | 248,510             |          |

It appears from the above that stationery forms a large portion of the exports, which consist of numerous small articles, such as porte-monnaies and similar goods, for which Berlin and other Zollverein large cities are celebrated. From 1844 to 1847 the annual amount of rags imported exceeded that of the exports by nearly 11,000 cwt. In 1848 this excess of imports was reduced to 4,500 cwt. In 1849 and 1850 these amounts increased;

and in the latter year the imports were 8,386 cwt., and the exports 1,604 cwt., showing an excess of 6,782 cwt. of rags imported more than those exported. The first paper-machine was established in Berlin in 1818.

Printing keeps pace with paper-making. The circulation of periodicals is very considerable. In 1840, Prussia alone had more than 300 newspapers and periodicals, and the number has since greatly increased. In Germany

the great number of scientific works form an important branch of the book trade. The catalogue of the Leipzig fair of Easter 1851 gives the titles of upwards of 4,000 new books; and that of Michaelmas 1851 about the same number. In 1850, 16,783 cwts. (Zollverein standard) of books were imported, and 24,897 cwts. exported. In Prussia alone there are 24 type-foundries, in which 244 workmen are employed; in the Zollverein above 50 foundries, employing upwards of 600 workmen.

The number of establishments in Prussia for book

printing and music is 574, with 1,154 presses, and 3,585 workmen. Berlin possesses 53, with 198 presses, and 934 workmen. The whole of the Zollverein, with the exception of Wurtemberg, Brunswick, and Frankfort-on-the-Maine, from which States the official accounts are wanting, has 933 establishments, with 2,085 presses, and 7,082 workmen; so that when the returns from those States are ascertained, not less than 1,000 establishments and 8,000 workmen will be the probable numbers. In 1849 there were in the Prussian dominions,—

|   |     |           |          |
|---|-----|-----------|----------|
| Establishments for copper, stereotype printing, and wood-cut printing | 85, | employing | 112 men. |
| Establishments for lithography  | —   | —         | —        |
| Booksellers, print, and music shops                                   | —   | —         | —        |
| Old book shops ( <i>antiquaire</i> )                                  | —   | —         | —        |
| Circulating libraries   | —   | —         | —        |

Lithographic printing is much more on the increase than the other branches of printing. Leipzig is the centre of the Zollverein book trade, where booksellers from Germany and other countries assemble twice a-year, at Easter and Michaelmas, to confer with each other and balance their accounts. Berlin is the seat of the Royal Academy of Sciences, with its own printing-office for difficult and learned works; the University, with its many scientific establishments; the Royal Library, the great museum of art; and printing establishments are

found there in great numbers. There were, in that city alone, in 1849, 8 type-foundries, with 110 workmen; 53 establishments for printing books and music, with 198 presses, and 934 workmen; 17 establishments for copper, steel-plate, and wood-cut printing, with 64 workmen; 41 lithographic establishments, with 265 workmen; 121 book, print, and music shops, with 141 workmen; 17 dealers in old books; 43 circulating libraries.

The following official tables, prepared with great care, furnish valuable information:—

LIST of PAPER-MILLS, specifying the Number of VATS and PAPER-MAKERS, together with the Number of PERSONS employed in the Year 1846.

| STATES OF THE ZOLLVEREIN.                                     | PROVINCES.   | Number of Mills. | Number of Workmen. | Number of Vats. | Number of Paper Machines. |
|---|--|------------------|--------------------|-----------------|---------------------------|

The Jury with pleasure acknowledged their obligations to Professor Dieterici, Chief of the Bureau of Statistics at Berlin, for the valuable Statistics of the Zollverein.

The following is a list of paper-makers from the Zollverein who exhibited at the Great Exhibition:—

MM. ERNST BROTHERS, Berlin (1 Zollv., p. 1056).—Excellent writing and printing papers, bank-note paper, with superior water-mark; glazing-boards of good quality; and carton-pierre, for roofing.

M. WURTT, of Pulverkrug, Frankfort-on-the-Oder (1 Zollv., p. 1056).—Tinted printing-papers of ordinary

M. C. A. KORN, Gladbach (1 Zollv., p. 1069).—Samples of excellent plate, writing, and printing papers; good colour, and well sized.

MM. HOEACH and SON, Duren (1 Zollv., 392, p. 1072).—Specimens of writing and printing papers; well-made coloured post papers, coloured tissues—black and rose colour, bright and good.

M. SCHÜLL, of Duren (1 Zollv., 393, p. 1072).—Laid writing-papers and printing-papers of fair quality.

L. PIETTE, of Dillengen (1 Zollv., 394, p. 1072).—Writing-papers of excellent qualities and good colour, but rather too soft sized.

M. FISCHER, of Bautzen (3 Zollv., 168, p. 1112).—Printing, plate, lithographic, and writing papers, of excellent qualities.

MM. RAUCH BROTHERS, of Wurttemberg (4 Zollv., 44, p. 1117).—Writing-papers of superior quality; thin paper, well made and hard sized; veneered paper, blotting on one side, the other sized for writing.

MM. SCHARFFLEIN, of Heilbronn (4 Zollv. 41, p. 1117), displayed a large assortment of well-made and good papers of every description, thin *pelure*, or thin post writing-paper, of good colour, well sized and clean, the folio ream 11s.; white tissues of good quality at 4s. 3d. or 5s. the ream; coloured tissues, bright tints, 10s. the ream; fine and well-made plate-paper, 8d. per pound; second quality plate 6½d. per pound.

#### UNITED STATES OF AMERICA.

About the year 1730, a paper-mill was erected in Massachusetts, and, about the same time, another in Pennsylvania; but prior to the American Revolution the progress in this important branch of manufacture was very slow. It appears, however, that before 1768, Christopher Leffingwell began to make paper at Norwich, in Connecticut, and received a bounty from the treasury of the colony of "twopence the quire on all good writing-paper that he made, and one penny the quire on all printing and common paper." At the end of the first year, in May 1770, he received the bounty for 4,020 quires of writing-paper, and 10,600 quires of printing and coarser paper, after which the bounty was discontinued. Messrs. Watson and Ledyard set up a paper-mill in East Hartford, in the same colony; and this one mill, in 1776 and 1777, wholly supplied the press of Hartford, which published weekly above 8,000 newspapers, and also the greater part of the writing-paper used in Connecticut, as well as rough of that used by the continental army. Shortly after this, paper-mills sprang up in every part of the country, and continued to increase with extraordinary rapidity, as did also the number of newspapers and cheap books. Prior to 1810, the materials for paper-making were procured in the country; but, since that period, they have been largely imported from Europe. Nearly all the linen rags are imported, and are in great request in the United States for the purpose of mixing with the domestic cotton rags. It is estimated that the Italian rags used to contain about 80 per cent. of linen; but it is found that, as cotton for clothing is increasing in all parts of the world, the proportion of linen in the foreign rags is decreasing from 5 to 10 per cent. annually. This fact at first created some alarm; but it is ascertained that raw cotton, where it can be had on the spot for 3d. or 3½d. per pound, answers as a very good substitute for linen. In the United States, the best qualities of writing paper contain from 30 to 50 per cent. of linen rags. The import duty on rags is 5 per cent. In the year ending June 1850, the quantity of rags imported into the United States was 20,696,875 lbs., of which about one-half, or 10,277,337 lbs. were from Italy; 3,964,815 lbs. from Trieste and other Austrian ports; 1,621,692 from England, Scotland, and Ireland; 14,540,042 from the Hanse Towns; and 1,619,114 from Sicily. The remainder were chiefly from Turkey and Canada.

About 1820, machinery began to be imported into the United States from England and France; but, being found expensive, this was not much encouraged. It was not till about 1830, that Messrs. Phelps and Spafford, of Connecticut, succeeded in manufacturing their machines, which are said to work well. They were much patronised, and they soon greatly enlarged their manufactory. Not long after Messrs. How and Goddard, of Worcester, Massachusetts, began to manufacture in great numbers machines for paper-making. At the present time, these two manufacturers produce nearly all the machines employed in the United States, and have besides begun to export them to South America and Mexico. The machines made by these two firms are those known as the Fourdrinier Machines, with some modifications. A cheaper kind, known as the *Cylinder Machine*, is used extensively for making the coarser and cheaper sorts of paper. These machines are also made in many other parts of the country.

It is only since 1830 that any real impulse has been given to the manufacture of paper in the United States; and this is owing, not more to the introduction of machinery than to the great changes in the mode of manufacture, as well as in the raw materials. Various articles are now extensively used which were not thought of before the introduction of chlorine and other means of

cleansing and bleaching. Old junk, rope, hemp, tow, bagging, raw cotton, cotton waste, coloured or filthy rags, &c., are now extensively used even for superior papers. These materials, which were previously only used in the making of coarser papers, have risen 300 per cent. in value; in the United States, they are particularly useful, and consequently in great demand, where no linen is produced for mixing with, and imparting strength to, the cotton materials.

Since the beginning of the present century, the quantity of paper imported into the United States has been constantly decreasing, so that at the present day the proportion of foreign paper is only between two and three per cent. on the whole amount consumed. The paper imported is now almost exclusively of the superior qualities of writing and fancy papers, and is chiefly brought from England and France, each country exporting about equal quantities. Belgium and Italy also contribute a portion. The import duty on all kinds of paper is 30 per cent. *ad valorem*. There is no excise or stamp duty.

The Reporters regret that they have been unable to obtain from the United States the statistics of paper-making, which were so fully collected for the Census of 1850, but which have not yet been published. We are, however, officially informed, that the number of engines and paper-mills have recently very rapidly increased, especially in the southern and western States. It is estimated that the cost of manufacturing paper at the present day, with all the improvements in machinery, and the increase in the variety of the raw materials, when compared with the old process and materials, is reduced fully 800 per cent. Hence the old-fashioned mode of making hand-made or laid paper is almost entirely abandoned in the United States, there being now only two mills of any note engaged in its manufacture. Even these only make paper of particular sorts, such as bank-note paper, letter, deed, parchment, and such others as require great strength and firmness.

The general diffusion of knowledge, and the consequent demand for newspapers and cheap literature, has rendered the United States the country which, it is said, consumes more paper per head for its population than any other. But the great aim of the manufacturer is rather at cheapness than excellence in quality, though within the last five years improvements in the strength and quality of paper have been made. Recently, the finish of writing and printing papers has been much improved by the introduction of iron and paper calenders.

#### PAPER-MAKING—AUSTRIA.

The principal mills are in Lombardy, Lower Austria, and Bohemia; there are also some in Venice, and in the Tyrol. Lower Austria contains the most extensive mills. The whole amount of paper produced per annum is now stated to be 650,000 cwts., 250,000 cwts. being common writing, and 60,000 cwts. fine paper; 150,000 cwts. printing, 100,000 cwts. packing, and 60,000 cwts. paper of other descriptions. Steam-power is applied in a few instances, but the mills are chiefly driven by water-power; three-fifths of the whole produce is by vat-mills, and two-fifths by machines. On a population of 38,000,000, it is stated that three pounds of linen rags are produced per head. There are, besides, quantities of old rope, &c., used for paper-making. According to Messrs. Dernier and Mayer d'Anemarr, French Commissioners at the Austrian Exhibition of 1845, the number of paper-machines in that State was 40, the number of vats 940; producing nearly 314,000 quintals (15,011 tons) of paper, valued at 20,500,000 francs, being an average of 6½d. per lb. The number of persons employed was 12,000, besides rag-sorters.

The number of machines is now 49, and 900 vats. Austria exports paper to the amount of 150,000l. per year.

#### PAPER-MAKING—DENMARK.

In Denmark there are six machines, besides one in Holstein, and 20 vats, producing altogether about 1,312 tons per year. In 1847, Denmark imported about 300 tons of paper from Belgium, France, and other countries. The

first paper-mill of Christian III was made by C. Drewsch, in 1826.

#### PAPER-MAKING—SWEDEN.

In Sweden there are five paper-mills, employing seven machines, and eight vat-mills.

#### PAPER-MAKING—SPAIN.

In Spain there are 17 machines: 1 in Old Castile, 2 in Valencia, 3 in New Castile, 1 in Estremadura, 2 in Catalonia, 2 in Arragon, 1 in Andalusia, 3 in Guipuscoa, and 1 in Navarre. The principal mills are at Burgos; at Rascasfría, near Madrid; at Candelario, near Begor; and at de Coppelkdes, near Barcelona. The machines have been imported from England, France, and Belgium; the first was established near Manzanarés, in La Mancha, by Don Thomas Jordan. There are also 250 vats. The whole produce is 4,741 tons yearly. Of 3,400,000 kilogrammes of paper made in Spain, Catalonia produces 700,000 reams. The weight of rags used in this province is said to be 16,071 tons yearly. One hundred and forty thousand reams of paper were exported from Spain in 1848, to the following countries:—to Cuba, 94,000 reams; to Chili, 16,000 reams; to Porto Rico, 10,000 reams; to other countries, 20,000 reams.

#### PAPER-MAKING—NETHERLANDS.

The importation of paper in the Netherlands, in 1847, was 219 tons, valued at 17,919 florins, chiefly from Belgium and the Zollverein. The importation of rags was 700 lbs. only. The exportation of paper, in the same year was 148 tons; its principal destination was Java. The exportation of rags was only 1,200 pounds weight.

#### PAPER-MAKING—SARDINIA. TUSCANY.

In the kingdom of Sardinia there are 12 paper-machines and 60 vats. The first machine was established at Borgo Sesia for Mr. Molino. In 1848, the paper produced, none of which was exported, amounted in value to 6,000,000 florins; whilst in 1846, 1,178 tons of paper was exported from Genoa to Mexico, Spain, and the Brazils.

In Tuscany there are 20 paper-mills, and two Donkin machines, at the mill near Florence. In 1848, the exportation of rags and paper from Leghorn amounted to 30,000 lbs.—about half to England, and the other half to the United States.

#### PAPER-MAKING—HAMBURGH.

The importation of paper in Hamburgh, in 1848, was of the estimated value of 1,288,000 francs (51,250*l.*)

#### PAPER-MAKING—SWITZERLAND.

In Switzerland there are 26 machines and 40 vat-mills, producing together 11,607 tons annually. The men's wages are 90 centimes per day (about 8*d.*), and the women 60 centimes (5*d.*). No paper is exported.

#### PAPER-MAKING—SAXONY.

In the kingdom of Saxony, in 1847, there were 66 paper-mills, with 6 machines, employing 992 persons. The exports and imports are trifling.

#### PAPER-MAKING—ITALY.

In Italy, Lombardo-Venetian Kingdom, six machines are distributed among four mills.

#### PAPER-MAKING—SICILY.

In the kingdom of the Two Sicilies there are 12 paper-machines. In 1837, MM. Firmin Didot Brothers and Lefèvre established the first machine, under a patent of importation in the Mill of Fibrene (Isola di Sora). The number of persons employed is 1,200. There are about 12 vats, employing 200 persons. The whole produce amounts to 200 tons annually, and paper is exported to Sicily, Rome, Leghorn, Malta, the Ionian Isles, and G.

#### PAPER MAKING—ROMAN STATES.

In the Roman States there are three machines; at Anatrella, at Fiume, and in the neighbourhood of Rome.

#### PAPER MAKING—TURKEY.

In Turkey there is one mill at Smyrna, and one paper-machine, besides one vat-mill at Constantinople.

#### PAPER MAKING—EGYPT.

In Egypt, one vat-mill at Boulac, near Cairo.

#### PAPER MAKING—PRICE OF RAGS.

The following is the present price of white rags:—

|   | Per Ton. |    |    | For 100 kilos. |     |    | For 220 <i>l</i> bs. |    |    |
|---|----------|----|----|----------------|-----|----|----------------------|----|----|
|   | £.       | s. | d. | £.             | s.  | d. | £.                   | s. | d. |
| In America - - - -  | 28       | 2  | 0  | 70             | fr. |    |                      |    |    |

#### IV. PLAYING-CARDS.

The country in which playing-cards were invented has never been ascertained with any certainty, neither are we acquainted with the precise time of their introduction into Europe. Numerous speculative opinions have been put forth in order to prove that the art of wood-engraving originated from the manufacture of playing-cards, it being supposed that the outlines of the figures or court-cards were cut on wood, and that from this was obtained the first idea of wood-engraving. The most ancient cards we have seen appear to us to have been stencilled, and this method seems to have been employed for the outline of the figures, as well as for the filling in of the different colours; therefore, as stencilling\* was probably known long before wood-engraving, we are inclined to believe that the figures were not taken from wood-engravings until at a later period, as an improvement on the former mode. Some card-makers of the present day manage stencilling with great skill, and the method is a favourite one, as it leaves no impression to show through on the back of the card, a fault sometimes difficult to avoid in white-backed playing-cards, when the outline has been printed on the card-board with a printing-press.

The cards mentioned as the oldest cards we have seen belonged formerly to Mr. Tutet, who has written the

\* A playing-card stencil is a sheet of strong paper, covered with several layers of oil paint on both sides, and kept for a long time until thoroughly well seasoned, when the form of any figure required is carefully cut out so as to leave sharp edges. The colouring matter, mixed with paste, is brushed over with a large circular brush, and enters into the cut-out parts of the stencil, and thus imparts the design to the card-board placed under it. If this operation is skilfully performed, much better and sharper outlines are obtained than would be generally supposed. Most of the card manufacturers still continue this mode of painting the pipes of playing-cards, as well as the filling in of the outline of the figures, which are cut on pear-tree wood. The manner of taking the impression of the outline of the figures was done by rubbing, until some few years ago, when Mr. Creswick first employed a press for the purpose.

following remarks on one of the fly-leaves of the volume in which they are collected:—"The ancient cards" in "this volume, with others, duplicate, and the drawings in "the second volume, were purchased by me out of the "collection of Dr. Stukeley; the drawings were produced "by the Doctor on the 9th of November 1720, to the "Society of Antiquaries, observing that the cards had "been given him by Thomas Rawlinson, Esq., being two "pieces of the cover of an old book, supposed to be "Claudian, printed before 1500; and then there was a "leaf or two of an old edition of Erasmus's Adages, "pasted between the layers of the cards, which being "laid stratum upon stratum, composed two pasteboards, "and made the cover of the book. The Doctor took the "pains to separate the cards, out of which I have chosen "a complete pack, and the better to preserve so singular "a curiosity, have had it bound, together with the draw- "ings, and some modern French cards. It is observable "in the ancient cards that there are no aces nor queens; "but instead of the latter, are knights." The marks of the suits are hearts, bells, bones, and acorns, and the court-cards are the king, knight, and knave. The size is 3 inches long by 2½ inches wide. They are very suddenly coloured. The figures on the French card above mentioned are the same as those still preferred in this country. It is curious to observe that while the honours of modern French cards have undergone a complete change, those preferred in England retain the costumes and outlines of the oldest French cards, every attempt made to modernize the English court-cards having invariably failed. Some years ago Messrs. De La Rue introduced some improvements, and endeavoured to induce the public to adopt a more modern and defined costume in the court-cards, but they were compelled to abandon the attempt, and return to the old style, after having incurred heavy losses in their endeavours to create a more elegant taste.

In 1392 or 1393, there is the following entry in the accounts of Paupart, treasurer to Charles VI. of France, that monarch having lost his reason in 1392:—"Given to Jacquemin Gringonneur, painter, for three packs of cards, gilt and coloured, fifty-six sols of Paris." The tenor of this passage seems to imply that cards were already known, therefore it is highly improbable that Gringonneur was the inventor, as has been asserted.

It is not known when the manufacture of playing-cards was established in England. As early as 1463 there were card-makers in this country, the importation of playing-cards having been prohibited by Act of Parliament in that year, as injurious to the interests of native manufacturers. No cards of English manufacture, of so early a date, have, however, been discovered.

The Abbé Rives ascribes the invention of playing-cards to the Spaniards before 1332. Mr. Anstes conjectures that cards were known at the end of the thirteenth century. They appear to have been known to the Italians in 1378, for Covelluzo states that the game of cards was brought into Viterbo, from the country of the Saracens, in that year.

In 1397, the labouring classes of Paris were forbidden to play at cards on working days.

Playing-cards appear to have been known in China at an early period. It is said that they were invented in the reign of Leun-ho (1120), and were common in 1131. They are called che-pae, which signifies *paper-ticket*. The Chinese cards in the Exhibition measured 2½ inches long by 1½ inch in width.

In the Museum of the Royal Asiatic Society there are three packs of Hindostan cards; they are circular, and measure 2½ inches in diameter, and some smaller, 2¼ inches. They appear to be made with canvass. In the Indian Department of the Great Exhibition there were also circular cards, which were strongly varnished on both sides. It is supposed that card-making among the Hindostanes is a regular profession, though possibly combined with some other branch of manufacture, as card-painting was combined with wood-engraving in the fifteenth century. The marks of the suits of Hindostanee cards appear to be identified with the customs, manners,

and opinions of the people. They coincide with the earliest European cards in having no queen, the two court-cards being a king and his minister or attendant, and the suits being distinguished by the colour as well as by the form of the mark or emblem.

Early in the fifteenth century card-making appears to have become a regular trade in Germany. Nuremberg, Augsburg, and Ulm were the chief towns for the manufacture of playing-cards. Besides supplying the home markets, considerable quantities were exported into Italy, Sicily, and over sea, and bartered for spices and other wares; and at the present day much larger quantities of cards are exported from Germany than from any other country. Their cheapness is, no doubt, the principal cause, for the German cards are generally inferior to those made in England, although some are well made since they have adopted the method of printing the pips and honours, as patented in England in 1832.

At an early period the Netherlands seem to have been famed for the manufacture of cards, for Albert Durer states that he bought half a dozen packs for seven stivers.

From a passage in Ascham's *Toxophilus*, 1545, cards were then about twopence per pack. This may appear very low to us now, when the duty alone is one shilling per pack for all cards used in England, but cards can be bought for half-a-crown a dozen in Hamburg; and if a sufficient demand could be had for export, cards could be produced in this country and sold at these prices.

Edward Darcy obtained a patent for the manufacture of playing-cards at the end of the reign of Queen Elizabeth, who, as well as her sister Mary, was partial to card-playing. The importation of cards was prohibited after the 20th July 1615, during the reign of James I., "as the art of making them was then brought to perfection in this country." The Company of Card-makers was first incorporated by letters patent of Charles I., in 1629. By a proclamation in June 1638, it was ordered that all foreign cards should be sealed in London, and packed in new bindings or covers. A few years later, 1643, the importation of cards was absolutely prohibited on the complaint of several poor card-makers, stating "that they were likely to perish by reason of divers merchants bringing cards into the kingdom." This prohibition continues up to the present day, except on payment of a *very high duty*, tantamount to the same thing.

During the reign of Charles II. card-making greatly increased in England.

Card-playing seems to have attained its full side in every part of civilized Europe in the reign of Queen Anne, and was both fashionable and popular in England. Ombre was the favourite game for the ladies, and piquet for gentlemen; clergymen and country squires played whist, and the commoners played at all-fours, put, cribbage, and contraloo. At no other time, before or since, was card-playing so prevalent. Kind landlords used to send a string of hog's puddings and a pack of cards, as a Christmas gift, to every poor family in the parish.

During this reign the card-makers petitioned the House of Commons on the occasion of a proposal to lay a tax of sixpence per pack on cards. "Nine parts in ten of the cards now made," they said, "are sold from 6s. to 24s. per gross, and even those at 6s. will, by this duty, be subjected to 3l. 12s. tax. This, with submission, will destroy nine parts in ten of the manufacture; for those cards which are now bought for 8d. per pack can't then be afforded under 10d. or 1s. If any of your Honours hope by this tax to suppress expensive card-playing, it is answered, that the common sort, who play for innocent diversion, will only be hindered; the sharp gamblers who play for money will not be hindered by 12d. a-pack." It is stated that "40,000 reams of Genoa white paper were annually imported chiefly for the purpose of making cards. The business was in the hands of small masters, mostly poor, of whom there were no less than a hundred in and about London. Their price to retailers, one sort with another, was three-half-pence a pack, and their profit not above a halfpenny."

We doubt whether so large a quantity as 40,000 reams

\* Now in the possession of Mr. De La Rue.

of Genoa paper was ever consumed in manufacturing playing-cards; if so, the sale must have been far greater than within the last 50 or 60 years, for that quantity of paper would have produced 5,000,000 packs of cards, whereas the amount was only 507,672 packs for the home and export trade in 1851. And as five or six card-makers supply the demand, it appears doubtful whether so large a number as a hundred masters could ever have obtained a living by the trade. Genoa paper was preferred by card-makers up to a late period, for its silkiness, for its power of receiving the colour freely, and for taking the flint or glazing better than the harsh English paper. At present there may be a few reams still consumed by the old-fashioned makers; but the bulk of the paper is now made here, cards being almost all glazed by passing them between copper-plates through rollers, instead of glazing them with a flint, as formerly.

In the early part of the reign of George III. card-playing was very prevalent.

Until lately the importation of cards was prohibited in Russia, where the manufacture of cards is a royal monopoly. The whole income derived from their sale is applied towards the maintenance of the Foundling Hospital. The manufacture of playing-cards is carried on, on a very large scale, at Alexandroffski, near St. Petersburg. The machinery applied to the manufacture of cards in the Imperial Manufactory is the invention of Mr. Applegath, and is under the direction of General Wilson. All the modern improvements for the manufacture of cards are to be found in that establishment, many having been furnished by Mr. De La Rue. His patent process was adopted for a superior description of cards many years since. The cards printed at Applegath's machine are in water-colours; and although upwards of 14,000 packs are manufactured daily, the supply is not equal to the demand. The best Russian playing-cards are excellent, surpassing most continental cards in the glaze and all the essential qualities of good cards.

The demand for playing-cards has not kept pace with the increased population of this country; the duty of one shilling per pack\* operating, with other circumstances, such as musical evenings, reading societies, &c., against their greater use.

No person is allowed to manufacture playing-cards in this country except in the cities of London and Westminster, and in the city of Dublin, in Ireland. Their manufacture is prohibited in Scotland. The duty is upwards of two hundred per cent. on the cost of manufacture, besides the duty on paper, which amounts to about 6d. on a dozen packs.

In consequence of the re-issue of second-hand playing-cards being allowed, forged aces, with the London makers' names, have been introduced from abroad, and used for spurious cards, which are sold for second-hand, thus causing detriment to the English manufacturer and loss to the revenue. The permission to re-issue second-hand cards seems to have been retained in reference to those by whom club-houses are supplied, the cards when once played with, becoming the perquisites of the servants, who obtain a certain price from the original vendor, by whom they are again sold. This opens the door for the contraband cards with forged aces, and is undoubtedly a grievance that Government ought to remove. If the duty were reduced from one shilling to three pence per pack, it would put an end to smuggling, forgery, and perjury, as regards cards; the sale would increase, a larger quantity of paper would be consumed, and employment given to a number of extra hands.

The duties and export aces are printed at Somerset

\* Cut-corner cards are the waste of card-makers, and are not allowed to be sold in regular packs, although they may be sold as waste, provided half an inch be cut off one corner. The wording of the Act of Parliament relative to this subject is so imperfect, that for two or three years cut-corner cards were regularly manufactured and sold; but the Commissioners of Stamps and Taxes declared the sale illegal, and took proceedings for certain penalties against the makers. There are still manufacturers who sell these cut-corner cards, to the injury of the fair trader, and exposing him to the threat of heavy penalties.

House on paper furnished by the card-makers, who have also to pay thirty pounds for every ace-plate, engraved by Messrs. Perkins and Co., and sent by them to the Inland Revenue Office. If the ace-plate, on which there are twenty aces, be engraved on steel, it will last for a considerable time, but it is notwithstanding a heavy charge on the manufacturer of playing cards, as two different aces are required, one for the home trade, the other for exportation. Every card manufacturer is required to give two securities in 500*l.* each before a licence can be obtained. When aces are wanted by the card-maker, a requisition is sent to Somerset House, and a ream, containing 9,600, is usually drawn at one time. An officer is sent round to the different card-makers with seals, one of which is affixed to each pack required for immediate sale. According to the number of seals furnished to each maker by the officer, the amount of duty of 1*s.* per pack must be paid on the first of each month. The aces remain in stock at the manufacturer's, the quantity in hand being ascertained by officers sent from time to time to inspect them. Should any deficiency be found, the duty must be paid on such deficiency, and the manufacturer is called to account for the irregularity. When playing-cards are required for exportation, the manufacturer has to enter into a heavy bond, with security, to insure the *board* safe landing of the cards at the port named in such bond, and a drawback of three halfpence per pound is allowed on all cards exported; but it often happens that the expense of the bond for small parcels is such as to make it a matter of indifference whether the drawback be obtained or not; and it certainly checks the sale of cards for exportation, for many persons would buy two or three dozen, when they do not wish to take grossen, to form an assortment of stationery for exportation.

The amount of duty paid on playing cards in 1850 was 11,782*l.* 10*s.*, sterling, being on 235,650 packs. The number exported, on which there was no duty, amounted in the same year to 329,888 packs.

In the last year, 1851, there was a diminution of duty-paid cards, as well as exports. The number of duty cards sold was 226,576, being 9,000 less than in 1850, and 281,106 packs for exports, being 48,782 packs less than in 1850.

The general mode of painting playing-cards is by stencilling with water-colours mixed with paste. The card-board used in England consists of four sheets of paper; two strong sheets of cartridge are first pasted for the inside of the board: they are hung up to dry, well pressed, and afterwards covered on each side with a sheet of paper, which should be strong and well sized. The outlines of the honours, as well as the ornamental backs, are printed with a letter-printing press. The pips are stencilled, 20 cards being the usual quantity on a sheet of foolscap. They are packed in what is technically called works; each work should yield 16 dozen and 8 packs of cards. They are well dried and aired, and then rubbed over with Castile soap, that the flint with which they are glazed may pass smoothly over without tearing the card-board. The operation of glazing with a flint is tedious, and causes much waste. When glazed, they are taken to the cutter, and from him to the women-sorters; they are carefully looked over, all defective cards being put aside for a cheaper description. All the picked cards are laid at what is called the head of the table, and constitute those denominated "Moguls" (best quality); the seconds, or slightly defective, come next, and are called "Harrys;" the last and most defective are the "Highlanders." A work of 16 dozen that turns out well should yield the following proportions: from 8 to 10 dozen of Moguls, 3 or 4 dozen Harrys, and the remainder Highlanders. They are put in wrappers, with a thread tied round each pack, sealed by a revenue officer when required, and put up in parcels of six packs, which are called sixaines.

There was little or no improvement in the manufacture

\* It is a curious fact that the technical terms used in the workshops of playing card-manufacturers in this country are French words, such as *sixains* (sixaines), *brief*, *brief* (short), &c., &c.: this seems to imply that practical card-making was introduced by the French into England.

of playing-cards until 1832, when Mr. De La Rue obtained a patent for certain improvements, which consisted in substituting printing with oil colours, in lithography or letter-press, from wood or metal blocks, and using a superior description of quick-drying printing-ink, not liable to set-off in glazing. By this process a much sharper impression is obtained, the colours are more vivid, and the backs better ornamented than could be effected by stencilling with water-colours. The patent mode of manufacturing playing-cards has been adopted by many of the German manufacturers, and by the Imperial Government of Russia.

In his work on playing-cards, Mr. Chatto says, that "no other game was ever so generally played by people of both sexes—young, old, rich, and poor. It is, perhaps, as extensively diffused as the use of tobacco, and is certainly indulged in by a greater variety of persons." We are much indebted to Mr. Chatto's "*Facts and Speculations on Playing Cards*" for the valuable information it has afforded us, and of which we have made free use.

The following is a list of the playing-card manufacturers who exhibited:—

*England.*—Messrs. DE LA RUE and Co. 76, pp. 541, 542) exhibited some beautifully-manufactured packs of playing-cards, with ornamental backs of flowers, fruits, and ornaments, from drawings by Mr. Owen Jones; among them a series of four, with interwoven monograms of Her Majesty, His Royal Highness Prince Albert, His Royal Highness the Prince of Wales, and Her Royal Highness the Princess Royal; the monograms in each are surrounded with groups of flowers exquisitely executed in chromolithography. The rose and hawthorn, typical of youth and beauty, surrounds the monogram of Her Majesty; H.R.H. Prince Albert is appropriately represented by the holly, the ivy, and the oak; the fuschia and daisy express the beautiful childhood of H.R.H. the Prince of Wales; the primrose, violet, and lily, the innocence, modesty, and beauty of the Princess Royal.

Messrs. De La Rue had also some cards adapted for near-sighted people, the pips being in different colours—the spades in black, the clubs in green, the hearts in red, and the diamonds in pale blue. These coloured cards were suggested by Sir Frankland Lewis. Messrs. De La Rue's playing-cards, called Victoria cards, surpass all others in finish, quality of paper, perfection of printing, and ornaments on the backs.

Mr. WHITTAKER, of London (49, p. 541), contributed some single cards, of various patterns, as examples of playing cards in gold and colours; the designs of these are commendable, but as none were exhibited made up in packs, the Jury could not ascertain the degree of merit which would be due to them in a manufactured state.

There were several exhibitors of playing-cards from foreign countries, viz.:—

*France.*—M. BLAQUIÈRE, of Paris (1552, p. 4251), who had some with the pips in different colours. M. HULOT (882, p. 1222) had some court-card forms electrotyped.

*Belgium.*—Mr. DAVELOU D'ELHOUNGNE, of Bruges (444, p. 1165), specimens said to be printed by a new process, but the Jury could not discover any particular merit.

*Frankfort-on-the-Maine.*—M. C. L. WUEST (5 Zollv., 14, p. 1122), who appears to have adopted De La Rue's patent process, exhibited some cards with defined pattern backs printed in register, well executed; and he deserves mention as having produced good specimens of that particular style.

*Grand Duchy of Hesse.*—MM. FROMMANN, of Darmstadt (6 Zollv., 89, p. 1128), had good and well-made specimens. Mr. BEUTER, of Darmstadt (6 Zollv., 40), had some printed with oil colours. Mr. H. L. SCHNAPPER, of Offenbach (6 Zollv., 42), displayed some well-manufactured specimens.

*Austria.*—Mr. G. STROGER, Vienna (374, p. 1028), exhibited very well-made cards.

*Sweden.*—Mr. HJERLIN, of Stockholm (113, p. 1354), well-made and well-glazed playing-cards.

*Denmark.*—Mr. L. P. HOLMBLAD, of Copenhagen (27, p. 1357), had also some good playing-cards.

The playing-cards exhibited by these different countries indicate a marked advance in the manufacture of that article.

## V. MESSAGE CARDS.

Above thirty-five years since, the late Mr. W. Creswick, paper-maker, introduced a superior description of blank visiting and message cards, which until that period had been supplied by playing-card makers from their refuse boards. The great encouragement given by engravers, printers, and the public to the superiority of Mr. Creswick's cards, induced other persons to embark in this branch of the paper trade. New and important manufactories have risen, and there are now several in this country. The English blank cards are made of excellent paper; the best are made with drawing-paper; they are generally superior to those of any other country. It does not appear that any foreign manufacturers have paid as much attention to their production as the English.

## VI. DRAWING-BOARDS.

Drawing-boards should be manufactured of the best hand-made drawing-papers. Messrs. Hollingworth, of Turkey Mill; Messrs. Balston (under the well-known name of J. Whatman); Richard Turner, of Chafford; Mr. Wilnot; Messrs. Evans, of Derby, and one or two others, are the principal makers of drawing-papers fit for the purpose. When two or more sheets are pasted together, well rolled and pressed, they become London drawing-boards, best quality; Bristol boards are an inferior sort. There are several manufacturers of drawing-boards in London. Only two exhibited, Messrs. TURNBULL, of Holywell Mount, Shoreditch (45, p. 540), and Messrs. DE LA RUE, of Bunhill Row (76, p. 542). Messrs. GODIN, of Liège (284, Belgium, p. 1160), and one or two French paper-makers, also sent samples, but none were equal to the best London boards.

## VII. ENVELOPES.

The number of English exhibitors in this now important branch of the paper trade was nine; the most prominent of whom, Messrs. DE LA RUE (76, pp. 541–543), had a patent folding-machine at work, in the Main Avenue, during the whole period of the Exhibition, which attracted the public in such crowds that many were disappointed in their endeavours to see it. An idea may be formed of the magnitude to which this new trade has already grown, when we state that twelve of these machines fold and gum weekly nearly two millions of envelopes. The number of exhibitors from France was three. From other countries, there were none of any importance.

The use of envelopes was common in France before their introduction into England. It was not till 1839, in consequence of Mr. Rowland Hill's postage reform, that any important consumption took place in this country, yet little progress was made in the manufacture of envelopes until March 1845, when Mr. Edwin Hill and Mr. Warren De La Rue obtained a patent for cutting and folding them by machinery. Until this period envelopes were imperfectly folded by hand with a bookbinder's folding-stick, 3,000 per day being about the quantity an experienced workwoman could produce.

Before the penny postage, 26,000,000 letters passed annually through the Post Office. In 1850, 347,000,000 letters were posted; of this large number nearly 300,000,000 were enclosed in envelopes! Besides the plain envelopes for commercial purposes, there is a large consumption of fancy and ornamented envelopes, a considerable quantity of which are exported to most parts of the world.

The manufacture of envelopes gives employment to great numbers of young boys and girls, whose wages range, in England, from six to nine shillings per week.

Messrs. WATERLOW (46, p. 540) also had a folding-machine at work in the Machinery Department. It was

men; in Leeds, 9 men; in Halifax, 2 men; in Bradford, 3 men; in Dublin, 5 men; in Bristol, 3 men; and in Bath, 2 men. The principal English manufacturers in Class XVII. were Messrs. DE LA RUE and Co. (pp. 541—543), who contributed every variety of pocket-books, envelope-cases, card-cases, writing-desks in leather, velvet, and oak, solid sketch-books and drawing-blocks, despatch-boxes, wallets, blotting-cases, indelible diaries, and numerous other articles belonging to the trade of pocket-book manufacturers. Mr. MECHI (45, p. 791), in Class XXIX., contributed a large and elegant variety of dressing-cases, blotting-cases, and every description of goods appertaining to this branch. Mr. SMITH, Class X., had a case in the Main Avenue filled with a complete and elegant assortment of leather goods, consisting of desks, envelope-cases, blotting-cases, &c. &c. Mrs. SCHLESINGER, of the Old Jewry, had some pocket-books, letter-clips, &c.

*France.*—Widow SCHLOSS and BROTHER (No. 1480, p. 1247), whose manufactory in Paris is replete with presses, tools, and other appliances necessary for the production of porte-monnaies and similar leather articles, had a splendid assortment of well-manufactured goods in their *spécialité*.

**CARTONNAGE-PAPER BOXES.**—It is only within a few years that manufacturers in this country have adopted the mode of packing their goods in paper boxes. There is now a very large quantity of boxes manufactured in England, and although generally inferior in point of elegance to those made in France, some sorts are cheaper in England; notwithstanding the very high paper duty of 1½d. per lb. They are made principally in London, Manchester, Birmingham, Nottingham, Leicester, and other manufacturing towns, and, in Belfast, giving employment to a large number of hands.

In Paris four thousand persons are employed in the manufacture of paper boxes. The trade is divided into six distinct branches. The first comprises the most elaborately-finished and ornamental boxes, for the display of artificial flowers, rich velvets, ribbons, satins, silk trimmings, medals, miniatures, and *corbeilles* for wedding presents. The second class consists of boxes and small ornaments for confectioners. The third description is used for packing glasses, trinkets, and such goods as are sold at 25 sous (1s. 0½d.). Boxes for perfumery, for fans, gloves, &c., constitute the fourth branch. The fifth is chiefly applied to the manufacture of boxes for counting-houses, and large boxes for shawls and ribbons for exportation. The sixth and last comprises pill-boxes, wafer-boxes, and boxes for small wares. The *Cartonnerie* of Paris is superior to that of any other country, both as regards the neatness of execution, and the light and elegant style of ornamentation. There is also a description of *cartonnerie* manufactured at *Choix-deux* for fruit-boxes. The principal exhibitors from Paris were Madam MAYERS and Mr. DOPFER. From England Mr. TAYLOR, of Nottingham, had a stall in the Machinery Department, where he exhibited a variety of paper boxes.

**BLACK-LEAD PENCILS.**—Plumbago (carburet of iron) is the substance known under the name of black-lead, although it contains no lead, the popular name having no other foundation than the lead colour which it imparts when traced upon paper. Beckmann states that black-lead pencils were in use in 1565. The best plumbago is produced from the Cumberland mines. The pits are situated on the Borrowdale mountains, ten miles from the town of Keswick. The whole produce of these mines is sent up to London, where it is sold at an auction held once a month, at a house in Essex Street, Strand. The produce of six weeks' annual working of these mines is said to be from 80,000*l.* to 40,000*l.*

Plumbago is found in the neighbourhood of Ronda, in Grenada, and near Malaga, in Spain, but it is hard and difficult to grind. The best substitute for Cumberland plumbago is that of Bohemia and Bavaria. It is also found at Rhodes (Averyron), France. An inferior kind of plumbago is imported from Ceylon and Mexico.

In 1822 the late Mr. Mordan patented the application of plumbago in the form of very small cylinders, projecting from a cylindrical cone fitted to a pencil-case, which

soon became in general use, and of which there are now many inferior imitations. Mr. Brockendon, of London, has since patented a mode of compressing the dust of plumbago, imparting to it nearly the same firmness and quality as when in its original state from the Cumberland mines.

The manufacture of black-lead pencils has been considerably improved within the last ten years. Partly by the purification of good plumbago, and partly by the admixture of other substances, good black-lead pencils are produced without Cumberland plumbago, at considerably reduced prices. The qualities necessary in a good lead pencil differ very much according to the purpose for which it is to be used; a deep black mark, combined with great softness, being required for some uses, and for others the greatest hardness, with the power of pressing lightly. The articles exhibited prove how completely manufacturers have met these requisitions, by the numerous fine specimens in more or less elegant settings.

Among the best English makers who exhibited were Messrs. HANKS, SON, and Co., of Keswick (96, p. 544), who had specimens of pure Cumberland lead and composition used in the manufacture of black-lead pencils, specimens of the various stages of manufacture, from the raw material to the complete pencil, and pencils in various style of finish. Mr. MORELL (58, p. 199A) exhibited combined mechanical appliances for the preparation of lead pencils. Messrs. WOLFF and SON (68, p. 128) had specimens of pure Cumberland lead; specimens of compressed Cumberland lead; specimens of Ceylon plumbago, as produced from the mine, and some prepared and compressed; specimens of Malaga plumbago, as produced from the mines, and also some prepared and compressed. Messrs. ROWNEY and SON, of Rathbone Place (Class I., No. 64, p. 128), Messrs. BROOKMAN and LANGDON, of Great Russell Street (Class I., 64, p. 128), Mr. R. ADAM, of Maryport (Class I., 66, p. 128), and Messrs. REEVES and SON (Class I., 66, p. 128), also exhibited black-lead pencils. Mr. BROCKENDON, of Queen Square (Class I., No. 65, p. 128), exhibited plumbago from Cumberland, Ceylon, Davis' Straits, Spain, Bohemia, Greenland, California, and France.

*France.*—The well-known establishment of GILBERT and Co., in Giret (238, p. 1188), deserves mention. Sixty workmen, with an eight-horse steam-power engine, are employed in this establishment.

*Zollverein.*—The pencils exhibited by Messrs. A. W. FAHER and STEIN, of Nuremberg (2 Zollv., 81, p. 1102), were of the best description, and the prices extremely low. They employ upwards of 800 workmen. They export their pencils to Italy, Paris, Vienna, America, Russia, Great Britain, and other places, the demand being created by cheapness and good quality. MM. J. J. REHBACH, in Regensburg (2 Zollv., 82, p. 1102), exhibited specimens of their pencils, well-known under the name of *Regensburg pencils*, fully maintaining their well-founded reputation. M. BIRKMANN, of Nuremberg (2 Zollv., 79, p. 1102), had some black-lead pencils of fair quality.

*Austria.*—MM. L. and C. HARDMUTH had some specimens of pencils of excellent quality.

The English exhibitors of black-lead pencils were not in Class XVII., and it was not until the Jury had nearly finished their labours that they were requested to examine these productions.

**SEALING-WAX.**—Wax appears to have been used in Europe for sealing since the earliest ages. It has been asserted that sealing-wax was invented by a Frenchman in 1640. Beckmann quotes that Francis Rousseau, having during the latter years of the reign of Louis XIII. lost all his property by a fire, in order to maintain his family, prepared sealing-wax from shell-lac, as he had seen it manufactured in India. By this article Rousseau is said to have gained 80,000 livres in a year.

Mr. Jonas, known under the name of Jones, was the first manufacturer of sealing-wax in England. He had an apprentice about 1780, called Champante, who much improved sealing-wax, and became known at the beginning of the present century as a celebrated sealing-wax maker. Messrs. Champante and Whitrow were long known as

wholesale stationers and sealing-wax makers in Jewry Street, Aldgate, even within the last 40 years. All fine wax was then called "Dutch wax," and although made in England, it was stamped with a Dutch brand. Some sorts are still called Dutch wax, but this name denotes an inferior description. Sealing-wax is composed of the best shell-lac and Venice turpentine; the red is coloured with vermilion, and the black with the best ivory-black. Other colours are obtained by mixing with it different metallic oxides. The wax used for the Great Seal of England is made up according to a recipe kept in the Lord Chancellor's office. It appears to be composed of a compound of oils and balsams, and has a whitish appearance. The wax of the Great Seal and Privy Seal of Scotland has been manufactured by Mr. Waterston, of Edinburgh, for many years. It is made from resin and bees-wax, coloured with vermilion. The Exchequer Seal is green. Seals made of soft wax, like that now used for the purpose, do not last, nor does this soft wax yield so good and clear an impression as if it were made with the best shell-lac. There was, in a small case in the Portuguese Court at the Great Exhibition, some sealing-wax bearing a close resemblance to that from India. Sealing-wax was common in Portugal about 1560, and is supposed to have found its way there from India. Neither the French nor the German sealing-wax is so strong in shell-lac as the English. Camphor does not appear to have been added in the manufacture of sealing-wax until the middle of the last century; there is only a small portion of camphor in the India wax. If camphor be used in the manufacture of wax, although it much improves the burning, it renders it unfit for use in foreign climates. Good impressions can be made with the finest red wax at a temperature of 140° Fahrenheit, whilst 170° is required for India wax. Charter wax, like that of the Great Seal of Scotland, can be sealed at 118°.

Shell-lac is bleached to a cream colour by chemical means, and sealing-wax is made with it of a variety of delicate shades. In the Great Exhibition the French and Belgian cases contained a variety in the most beautiful colours, got up with great care and taste. Mr. WATERSTON, of Edinburgh, exhibited the Charter wax, red and green, India and bottle-wax, and every variety of shell-lac wax, bleached, unbleached, embossed, and plain. The English manufacturers of sealing-wax have made great improvements within the last 15 years. The English vermilion being bright enables manufacturers of sealing-wax to impart great brilliancy to their wax. Messrs. HYDE, of Fleet Street, had some beautiful specimens in great variety. Mr. HENRY MORRELL, Fleet Street, exhibited various specimens illustrating the manufacture of sealing-wax, rough sealing-wax, sticks of sealing-wax moulded and partly polished, finished, and stamped; sealing-wax in packages and of various qualities. Messrs. COOKE and SONS, of Cannon Street, had specimens of coloured, embossed, and transparent sealing-wax, with various impressions. The EAST INDIA COMPANY had some specimens of India wax.

*France.*—MM. VINCENT and TISSERANT, Rue Michel-le-Comte, Paris (730, p. 1215), exhibited specimens of sealing-wax of good quality.

*Belgium.*—M. ZEGELAER (280, p. 1160) exhibited various coloured sealing-wax.

*Portugal.*—M. MANOEL RODRIGUEZ LATA, of Lisbon (p. 1314), had some sealing-wax of different colours, closely resembling India wax.

*Zollverein.*—M. T. MANUEL KOHN, of Main-Bernheim, Bavaria (49, p. 1100), exhibited specimens of sealing-wax.

Most of these exhibitors were not in Class XVII.; the Jury had nearly completed their examination when they were requested to examine sealing-wax exhibited by contributors out of their Class.

#### AWARDS.

The Jury have awarded a Council Medal to the IMPERIAL COURT and GOVERNMENT PRINTING OFFICE OF VIENNA (Austria, 362, pp. 1025-1028), for their new processes in typography, galvano-plastic, and chemotypic printing: for the variety of their Oriental types, and perfect execution of the punches, as well as for the general

excellence of the numerous specimens exhibited in stereotyping, electrotyping, printing, and bookbinding.\*

Prize Medals are awarded to the following Exhibitors in the various departments of Class XVII. :—

ANGRAND, 59 Rue Meslay, Paris (France, 7, pp. 1169-1170), for general excellence in ornamental, coloured, and fancy papers.

ATKINSON, WILLIAM, dyer, Lamb's Passage, Finsbury, London (56, p. 541), for his superior finish of book-binder's cloth.

BARRITT and Co., bookbinders, Fleet Street, London (196, p. 550), for excellence in binding Bibles and Prayer-books, and for the neatness with which every leaf of a folio Bible is ornamented with blue edging.

BARRE, B., engraver, 62 Rue Mazarin, Paris (France, 40, p. 1173), for his superior engravings by Collas' tracing-machine.

BEAKEY, R., and Co., Fann Street, Aldersgate Street, London (195, p. 550), for the variety, beauty, and originality of their types.

BLANCHET BROTHERS and KLEBER, paper manufacturers, Rives (Isère), (France, 1090, p. 1230), for general excellence in their white and coloured papers.

BONE and SON, Fleet Street, London (62, p. 541), for cheapness and excellence in cloth bookbinding.

BROCKHAUS, F. A., printer and publisher, Leipzig (Saxony, 178, p. 1112), for his collection of three hundred and fifty-six volumes, the whole printed at his own establishment in the year 1850.

BRADBURY and EVANS, printers, Whitefriars, London (136, p. 545), for general excellence in various specimens of printing.

CALLAUD-BELISLE, NOUËL DE TYNAN and Co., paper manufacturers, Angoulême (France, 788, p. 1218), for the good quality of various papers.

CARLON and Co., type-founders, Chiswell Street, Finsbury, London (78, p. 543), for the beauty and great variety of well-finished types.

CHIRIO and MINA, Turin, Sardinia (Sardinia, 89, p. 1305), for superior workmanship in a folio volume, the "History of Hautecombe Abbey" with woodcuts and other borders, also for some printing materials.

CLARKE, J., Frith Street, Soho, London (68, p. 541), for various specimens of bookbinding; the hand-tooling of which is well-executed, with great solidity in the forwarding. Some tree-marbling on calf leather is carried to great perfection.

CLAYE, J., printer, 7 Rue St. Renoit, Paris (France, 798, pp. 1218, 1219), for superior workmanship in wood-cut and other surface printing.

CROSS, G., 2 New Coventry Street, Leicester Square, London (88, p. 543), for a new mode of fastening the leaves of scrap-books without guards.

CUSSENS and Co., dyers, Bunhill Row, Finsbury, London (69, p. 541), for their bookbinders' cloth; the crimson and ultramarine blue are bright and beautiful, and show a marked advance within a few years in this important branch of manufacture.

DEWDNEY, J., Collumpton, Devonshire (143, p. 546), for the excellence of his writing papers, and also for the permanent dye of his blue papers for the use of starch manufacturers.

DEZAILLY, M., type-founder, 8 Rue Notre-Dame-des-Champs (185, p. 1183), for his improved music types and flourishes, and for the perfection of various founts exhibited.

\* The following resolution was moved by M. Didot, seconded, and unanimously passed by the Jury, at the sitting of the 21st of June 1851 :—

"That the following paragraph be inserted in their Report—

"That the Jury regrets that the position of Mr. DE LA RUE, as a Juror, has not allowed this Jury to recommend that the Council Medal be awarded to him, which in their opinion he so justly deserves, both as an inventor of acknowledged distinction, and for having exhibited a great number of specimens of general stationery and playing cards, among which the Jury has specially noticed the papers of Mr. Richard Turner, of Chafford, Kent."

DECKER, R. E., printer, Berlin (Prussia, 148, p. 1056), for his Oriental and other types; for the excellence of his printing, as exemplified in a large folio New Testament, and in the works of Frederick the Great, all of which are well got up, the paper, type, and ink, being of the best quality.

DREWSSEN and Sons, Silkeborg, Jutland, Denmark (Denmark, 4, pp. 1355, 1356), for a specimen of cream-laid writing-paper, well-glazed, in long lengths.

DESROSNIERS, A., printer, Moulins (Allier), (France, 817, p. 1219), for general excellence, as exemplified in six volumes exhibited; a remarkable specimen of good printing, considering the disadvantages a printer labours under in a country town.

DOUMERGUE, E., the Joint-Stock Paper-making Company of the Marais and Ste. Marie Paper-Mills, Jouy, St. Morin, Seine-et-Marne (France, 822, p. 1220); dépôt, 3 Rue du Pont de Lodi, Paris; for the excellence of printing, writing, and drawing machine-made papers.

DOWLING, H., Van Diemen's Land (Van Diemen's Land, 331 and 333, p. 999), for a specimen of Tasmanian printing, as shown in the Tasmanian Calendar and Tasmanian Journal.

DUPONT, P., 55 Rue de Grenelle-St. Honoré, Paris (France, 181, p. 1182) for superior skill in producing fac-similes of old books, and for general excellence in printing.

DUZOGLOU, Messrs., Smyrna (Turkey), for excellence in writing-papers.

THE EAST INDIA COMPANY (p. 917), for their valuable collections of India paper.

ESBART BROTHERS, paper manufacturers, Berlin (Prussia, 145, p. 1056), for general excellence in papers, glazing-boards, carton-pierre for roofing, and paper with water-marks for bank-notes.

EGYPT, HIS HIGHNESS THE VICEROY OF (Egypt, 248, 374, pp. 1410, 1411), for a collection of one hundred and sixty-five volumes of books, printed in the Arabic, Persian, and Turkish languages, at Boulac, near Cairo, and likewise for a catalogue of all the books published in Egypt.

EVANS, J. S., bookbinder, Berwick Street (8, p. 537), for the clean and superior finish of his binding in white vellum, and the general excellence of the various specimens exhibited.

FABER, A. W., pencil-maker, Stein, Bavaria (Bavaria, 81, p. 1102), for the perfection of his black-lead pencils, for sketching, engineering, and architectural purposes.

FISHER, J. H., Hoxton (10, p. 537), for a new and ingenious mode of printing from copper-plate in two colours at one operation, with a peculiar ink, which resists water, but is altered by the usual chemical reagents, and which may be usefully applied to the printing of bank-notes and cheques.

FIGGINS, V. and J., type-founders, West Street, Smithfield, London, (124, p. 545), for the excellence and beauty of their types, and for the care bestowed in the finishing to insure correct justification.

FISCHER, C. F. A., paper-maker, Bautzen, Saxony (Saxony, 168, p. 1112), for the excellent quality of his plate, lithographic, printing, and writing papers; the engine-sizing of the writing-papers is very superior. A specimen of a large machine-made millboard, 1 inch thick, 3 feet wide, and 6 feet long, deserves special notice.

GAYMARD and GÉRAULT, 10 Rue Montmorency, Paris (France, 518, p. 1203), for their specimen of ledger binding. The large ledger in rough calf contains no less than one thousand ruled leaves, is well bound, opens very freely, and is a specimen of excellent work.

GILBERT and Co., pencil-makers, Givet, Ardennes (France, 238, p. 1188), for the excellence of their pencils.

GODIN, I. L., and Son, paper manufacturers, Huy (Liège), (Belgium, 284, p. 1160), for a large variety of printing, writing, and drawing papers, in all of which great perfection is attained.

HAENKICHT, A., bookbinder, Vienna (Austria, 376, p. 1029), for general excellence in bookbinding and in porte-monnaies, and leather goods of a similar description.

HARDTMUTH, L. and C., pencil-makers, Vienna (Austria, 381, p. 1029), for the good quality of their pencils.

HANICO, P. J., Mechlin (Belgium, 285, p. 1160), for his large collection of printed books, combining cheapness with good workmanship. His liturgies in red and black deserve notice.

HAASE, G., and Sons, printers and type-founders, Prague (Austria, 367, p. 1028), for the general excellence of their types and printing.

HAYDAY, JAMES, bookbinder, Little Queen Street, London (106, p. 544), for his superior workmanship, exemplified in the books exhibited by Messrs. CUNDALL and ARDEY.

HERRICK, J. K., stationer, New York (United States, 502, p. 1466), for his superior ruling of account-books.

HONIG, B. C. and I., Zaandijk, Netherlands (Netherlands, 59, 60), for specimens of superior parchment, and the excellence of their double elephant writing paper.

HOWE, S. G., Boston, United States (United States, 439, p. 1463), for superior characters for the blind, of an angular form, without capitals; this system is more simple than any hitherto attempted, and easier to distinguish by the touch.

HOSCH and Sons, paper manufacturers, Duren (Prussia, 392, p. 1072), for the cheapness and perfection of their white and coloured writing and tissue papers, among which the black and rose-colour are of peculiar brightness.

HYDE and Co., sealing-wax manufacturers, Fleet Street, London (21, p. 537), for the general excellence of their wax, some of which is said not to soften under a temperature of 120° Fahrenheit, and is therefore adapted for hot countries, as at this temperature it still retains the seal impression.

JOYNSON, WILLIAM, paper-maker, St. Mary Cray, Kent (42A, p. 540), for the superior quality and finish of his writing papers.

LONGHAUS and VENATOR, Darmstadt, Grand Duchy of Hesse (Hesse, 6, p. 1126), for letter-press relief coloured maps. The different minerals of each district are shown by appropriate colouring. (Medal awarded in Class 1.)

LAMB, J., paper-maker, Newcastle-under-Lyme, Staffordshire (147, p. 546), for excellence in the manufacture of pottery tissues.

LABOULAYE, C., and Co., type-founders, 30 Rue Madame, Paris (France, 895, p. 1223), for great skill exhibited in the finish of their printing types.

LEGRAND, MARCELLIN, type-founder, 99 Rue du Cherche-Midi, Paris (France, 584, p. 1206), for the general excellence of his types; for his specimen of casting, wherein one hundred and forty letters are cast at once; for his collection of Chinese types; and for the beauty of various specimens exhibited.

LACROIX BROTHERS, paper-makers, Angoulême, and Rue Mazarin, Paris (France, 1636, p. 1255), for the great perfection of their writing papers.

LEIGHTON, J. and J., bookbinders, Brewer Street, London (24, p. 538), for specimens of good binding in various stages; for the perfection with which they make fac-similes of missing pages to valuable works, and the care and finish which are conspicuous in all they have exhibited.

LEWIS, Mrs., Duke Street, St. James's (163, p. 547), for excellence in bookbinding.

LORTIC, P. M., bookbinder, 199 Rue St. Honoré, Paris (France, 1652, p. 1256), for the taste and execution displayed in the finish of several works, among which a folio volume, "Balbus de Janua," in an illuminated style, deserves particular mention. The firmness of the forwarding throughout the whole series of books exhibited by Mr. Lortic merits high praise.

MAURAN and VINCENT JOURNET, managers of the Joint Stock Paper-Making Company of the Souche, Vosges, and 5 Rue du Pont de Lodi, Paris (France, 377, p. 1195 and 619, p. 1207), for the general excellence of their printing-papers, and more particularly for the purity of their filtering-paper for chemical purposes, hitherto a great desideratum.

MAME and Co., Tours (France, 321, p. 1192), for the extreme cheapness and great variety of books printed,

bound, and published by them. Amongst others, "Le Paroissien Romain," 18mo, 636 pages, in Latin and French, neatly printed, with a vignette border to every page, in boards, is published at "one shilling."

MAVER, Madame T. (France, 624, p. 1207), manufacturer of fancy ornaments for confectioners, 22 Rue de la Vieille Monnaie, Paris, for general excellence.

MILIANI, P., Rome (Rome, 12, p. 1285), for the high quality of his hand-made plate and writing papers.

MÖNCH and Co., Offenbach, Grand Duchy of Hesse (Grand Duchy of Hesse, 66, p. 1129), for general excellence in porte-monnaies, pocket-books, and dressing-cases.

MONTGOLFIER, paper manufacturers, Paris (France, 324, p. 1192), for the general excellence of their paper, and for their imitation of parchment, adapted, among a variety of other useful purposes, to gold-beating, instead of the skin usually employed by gold-beaters.

NATIONAL PRINTING OFFICE (France, 544, p. 1204), for the variety of Oriental and other types, and for the beautiful execution of their specimen book, in which great taste is displayed; also for the elegance of the three Oriental volumes—"Le Premier Livre des Rois," the first volume of "L'Histoire des Mongols," and the first volume of "Bhagavata Purana," with border round every page in gold and colours. The ultramarine blue, printed as an ink, direct from the type, is pure and bright.

NIÉDRÉE, J. E., Passage Dauphine, Paris (France, 665, p. 1211), for his beautiful specimens of bookbinding, in which taste, elegant finish, and solidity are combined.

ODENT, SONS, and Co., Courtaulin, Seine-et-Marne (France, 938, p. 1225), for general excellence in a variety of papers, and also for their paper called animal parchment.

PAISGRAVE, J. T., Montreal, Canada (Canada, 189, p. 968), for a large and well-formed collection of printing types, cast at Montreal.

PLON BROTHERS, printers, 36 Rue de Vaugirard, Paris (France, 1395, p. 1243), for superior execution in different descriptions of woodcut and other printing.

KAUCH BROTHERS, paper-makers, Heilbronn, Wurtemberg (Wurtemberg, 44, p. 1117), for the excellence, good colour, and strong sizing of their writing-papers, and for their two-sided veneered opaque papers.

REMNAINT, EDMONDS, and REMNAINT, Paternoster Row, London (5, p. 537), for general excellence in design and workmanship, and novel application of materials in bookbinding.

RIVIÈRE, R., bookbinder, Great Queen Street, London (89, p. 543), for superior workmanship and finish in book-binding.

The RUBELAND DUCAL FOUNDRY INSPECTION at Prussia (780, pp. 1093, 1094), for specimens of stereotype plates in iron, and for the Bible printed therefrom.

SAUNDERS, T. H., of Dartford, Kent (36, p. 539), for a novel style of ornamental water-mark on paper, the water-mark giving gradations of shades. It was suggested by Mr. Oldham, of the Bank of England, at whose request Mr. Saunders applied it in the manufacture of paper.

SCHAEUFFELEIN, G., paper-maker, Heilbronn, Wurtemberg (Wurtemberg, 41, p. 1117), for the cheapness and good quality of his plate, printing, writing, and tissue papers. The water-mark is said to be put on dry, by a peculiar process, after the paper is made.

SCHLOSS, Widow and Brother, 15 Rue Chapon, Paris (France, 1480, p. 1247), for superiority in a large collection of porte-folios, porte-monnaies, porte-cigars, and other leather articles.

SCHREIBER, J. C. G., paper manufacturer, Merseburg (Prussia, 783, p. 1194), for his enamelled cardboards and paper, and for the general excellence of the various articles exhibited.

SINCLAIR, DUNCAN, and SON, Edinburgh (92, p. 543), for the general excellence of their specimen of printing types.

SILVERMANN, G., Strasbourg (France, 374, pp. 1194, 1195), for his specimens of surface printing in colours, and general excellence in the various productions exhibited by him. (Medal awarded in Class XXX.)

SMITH and MEYNTEN, Fiume, Austria (Austria, 360, p. 1024), for their specimens of well-made writing-papers.

SOHNÉE BROTHERS, Paris (France, 380, p. 1195), for their superior bookbinders' varnish.

SPICER BROTHERS, wholesale stationers, New Bridge Street, London (42, p. 540), for their collection of papers, showing the present state of the paper manufacture of England.

STEPHENSON, BLAKE, and Co., type-founders, Sheffield (182, p. 549), for general excellence.

THOMAS and SONS, Cornhill, London (44, p. 540), for account-books, combining great solidity and excellence in paper, ruling, and binding.

VARGOUNIN and BROTHERS, paper-makers, St. Petersburg (Russia, 260, 302, p. 1375), for the excellence of their writing-papers.

VENABLES, CHARLES, Clifden and Solio Mills (with 149, p. 546, Class XVII.), for the superior quality of plate, lithographic, and other printing papers.

VENABLES, WILSON, and TYLER, Queenhithe, London (149, p. 546), for the assistance they have afforded the Jury by their ample collection of specimens of paper from the principal manufacturers of the United Kingdom, and for the cheapness of the printing papers of their own manufacture.

VENABLES, GEORGE, paper-maker, Cookham Mills, near Maidenhead (with 149, p. 546, Class XVII.), for the good quality and strength of his wrapping-papers, more particularly that which is used for paper bags.

VIEWEG and SON, printers, paper-makers, and type-founders, Brunswick (Prussia, 822, p. 1095), for the great variety of useful publications.

WATERSTON, GEORGE, sealing-wax manufacturer, Edinburgh (93, p. 543), for the great excellence and brightness of his sealing-wax.

WESTLEYS and Co., bookbinders, Friar Street, London (111, p. 544), for superior workmanship in the finishing of a folio Bible, in green morocco, illuminated edges.

WESTLEY, J., bookbinder, Playhouse Yard, London (48, p. 540), for general excellence in bookbinding.

WILLIAMS, J., account-book manufacturer, Bucklersbury (53, p. 541), for the solidity and superior manufacture of a large ledger with iron back.

WRIGHT, J., bookbinder, Noel Street, Soho, London (139, p. 545), for beauty of execution in vellum and morocco, in blind-tooling and gold, and for superiority in forwarding.

The Jury desire to make Honourable Mention of the following Exhibitors:—

BANKS BROTHERS, paper-makers, Chesham (96, p. 541), for an improvement in the water-mark in paper.

BANKS, SON, and Co., pencil-makers, Keswick, Cumberland (Class I., 69, p. 129), for black-lead pencils.

BARKER, J., Bexley Heath, Kent (189, p. 550), for specimens of type-metal casts from wooden matrices, applicable to calico and other printing.

BARBAT, M., Châlons-sur-Marne (France, 1067, p. 1229), for letter-press and lithographic printing.

BATTEN, D., Clapham Common (59, p. 541), for various specimens of bookbinding.

BATTAGIA, G., Venice (Austria, 366, p. 1028), for some specimens of typography, with simple and convenient binding.

BEMAND, R., parchment-maker, Courtrai, Belgium (Belgium, 478, p. 1166) for various specimens of white and coloured parchment.

BERTHAULT, M., parchment manufacturer, Issoudun (Indre), (France, 56, p. 1174), for specimens of various descriptions of vellum and parchment. (Prize Medal awarded in Class XVI.)

BERGE BROTHERS, Offenbach, Grand Duchy of Hesse (Hesse, 60, p. 1129), for cigar cases, leather purses, and other articles of a similar description.

BERGER, C. H., Vienna (Austria, 380, p. 1029), for the great variety of wafers in paper and gelatine.

BONDON, L., 5 Rue Grange-aux-Belles, Impasse St. Opportune, Paris (France, 63, p. 1174), for specimens of enamelled paper.

- BRADLEY, B. and Co., bookbinders, Boston, United States (United States, 473, p. 1465), for cloth binding and block gilding.
- BRIARD, J. H., Ixelles, Belgium (Belgium, 277, p. 1159), for printed Bibles and Testaments.
- CALLAGHAN, Mr., Attorney-General, New South Wales (4, p. 989), for a volume printed from types cut and cast in Sydney, and printed by John Rowe.
- CUNDALL and ADDER, booksellers, 21 Old Bond Street (106, p. 545), for a specimen book cover in pierced metal.
- DE SERLAY, C. G., paper-maker, Gueurs, Seine-Inférieure (France, 1484, p. 1247), for a variety of tinted papers.
- DUFOUR, L., Boulevard Beaumarchais, Paris (France, 483, p. 1201), for his specimens of gold, silver, and other fancy papers.
- DORTER, J. V. M., 58 Rue de la Harpe, Paris (France, 1194, p. 1234), for his specimens of lace and other fancy papers.
- ENSCHEDÉ and SONS, Haarlem, Netherlands (Netherlands, 79 and 109, p. 1146), for printing-types and stereotyp plates.
- FARINA, A., Turin, Sardinia (Sardinia, 47, p. 1304), for small punches and types.
- FLECHET, J. B., paper-maker, Algiers (Algiers, 24, p. 1261), for cigarette and other papers manufactured from the leaves of the dwarf palm-tree.
- FESUND, E. A., Offenbach, Grand Duchy of Hesse (Hesse, 38, for a variety of enamelled card-boards and paper.
- GASSETT, H., Boston, United States (United States, 420, p. 1462), for vellum bindings and ruling.
- GAUTHIER, jun., 14 Rue de la Parcheminerie, Paris (France, 234, p. 1187), for brass letters for the use of bookbinders.
- GILLOT, M., 8 and 10 Rue du Chevalier du Guet, Paris (France, 522, p. 1204), for a new method of etching plates for surface printing.
- GLENNISON and VANGENECHTEN, Turnhout, Belgium (Belgium, 286, p. 1160), for cheapness in cardboards, and marbled and surface-coloured papers.
- GRAF, H., bookbinder, Altenburg (Prussia, 746, p. 1091), for block gilding on the covers of a large folio altar Bible.
- GRANGOIR, J. M. (France, 1256, p. 1237), for locks for pocket-books.
- GRUEL, Madame, 10 Rue de la Concorde, Paris (France, 857, p. 1221), for bookbinding with carved ivory and wood, and inlaid morocco, &c.
- GUMINU, M., 70 Rue du Temple, Paris (France, 250, p. 1188) for numerous specimens of ornamented paper and stationery.
- HAAS and Co., Offenbach, Grand Duchy of Hesse (Hesse, 62, p. 1129), for pocket-books, porte-monnaies, and other leather goods.
- HAENLE, L., Munich, Bavaria (Bavaria, 47, p. 1100), for burnished gold and other ornamental papers.
- HAHNEL, E., Berlin (Prussia, 284, p. 1065), for various matrices, types, and printing.
- HEYL, J. F., and Co., Berlin (Prussia, 44, p. 1050), for transparent wafers.
- HIDER, ELIZABETH, 15 Manor Place, King's Road, Chelsea (17, p. 537), for fancy floral ornaments, as applied to valentines.
- HIRSCHFELD, J. B., Leipzig, Saxony (Saxony, 180, p. 1113), for coloured surface printing.
- HULOT, A., Hotel des Monnaies, Paris (France, 882, p. 1222), for impressions from relief engraved plates.
- JANARY, A., Brussels (Belgium, 444, p. 1165), for his specimens of illustrated books and for woodcuts.
- KING, T. and J. H., Bartlett's Buildings, Holborn Hill, London (23, pp. 587, 538), for their new type music.
- KNIGHT and HAWKES, 18 Clerkenwell Green, London (107, p. 544), for stereotyping.
- KOCH, C. A., Gladbach (Prussia, 329), for writing and plate papers.
- KÜHN, C. and Sons, Berlin (Prussia, 152, p. 1056), for a collection of portfolios, pocket-books, albums, and porte-monnaies; and also for ruling for account-books.
- LEBRUN, L. J., 126 Rue de Grenelle St. Germain, Paris, (France, 906, p. 1223), for bookbinding.
- LEIBERGANG, W., bookbinder, Berlin (Prussia, 149, p. 1056), for a specimen of block-gilding on velvet.
- LEIGHTON and SON, Harp Alley, Shoe Lane (158, p. 547), for bookbinding.
- LIEPMANN, J., Berlin (Prussia, 147, p. 1056), for an ingenious mode of producing several impressions from a mass of colour in which the various gradations of tint are an inch or more in thickness, and which, on being moistened with oil and subjected to pressure, yields successive copies of the subject represented.
- MACOMIE, A., and Co., bookbinders, 6 Percy Street, Bedford Square (26), for their specimens of binding.
- M'ADAMS, J. and W., Boston (United States, 482, p. 1465), for ruling account-books, and for some circular ruling.
- MANCHIN and MOREL, 8 Wilson Street, Gray's Inn Road (128, p. 545), for novelty in the application of bitumen to the purpose of stereotype.
- MARTIN, J., London (29, p. 539), for a new mode of sizing paper, by which it is stated to be rendered waterproof.
- MARION, A., stationer, 14 Cité Bergère, Paris (France, 609, p. 1207), for a general assortment of fancy, ornamental, and plain paper and stationery.
- MEILLET and PICHOT, Poitiers (France, 629, p. 1208), for their postage and other stamps. They exhibit a paper which they state precludes the possibility of forgery.
- MEYER, E., 2 Rue de l'Abbaye, Paris (France, 637, p. 1208), for his specimens of printed designs in fifty colours, from surface-blocks, in imitation of Berlin patterns.
- MILLER and RICHARD, letter-founders, Edinburgh (150, p. 546), for a specimen of ruby type, in which "Gray's Elegy" is printed, thirty-two verses in two columns, occupying only three and three-quarter inches in length.
- MORRELL, H., Fleet Street (Class IV., 58, p. 199\*), for wax and wafers.
- NÉRAUDEAU, J. A., 16 Rue des Fossés Montmartre, Paris (France, 661, p. 1209), for ledger binding.
- OBRV, BERNARD, and Co., Prouzel, near Amiens (France, 334, p. 1193), for black and other papers.
- PIETTE, L., paper-maker, Dillingen (Prussia, 394, p. 1072), for various papers.
- PINCHES and Co., 27 Oxendon Street, London (33, p. 539), for specimens of stamping in relief on envelopes and writing-paper.
- PIQUES, —, Velars-sur-Ouche, Côte d'Or, (France, 1893, p. 1243), for pasteboards.
- REHBACH, J. J., Regensburg, Bavaria (Bavaria, 82, p. 1102), for black-lead pencils.
- REICHOLD, G., Stuttgart, Wurtemberg (Wurtemberg, 39, p. 1117), for fancy leather goods, porte-monnaies, &c.
- REGGER, H. J., Rotterdam (Netherlands, 112, p. 1149), for bookbinding.
- REVILLON, letter-founder, St. Petersburg (Russia, 361, p. 1283), for a specimen of printing, and also for his Greek, Oriental, and other types.
- ROMETSCH, C., Stuttgart, Wurtemberg (Wurtemberg, 73, p. 1109), for a substitute for writing slates.
- BOYSTON and BROWN, Old Broad Street, London (34, p. 539), for ledgers and other account-books.
- SCHÜLL, L., paper-maker, Duren (Prussia, 393, p. 1456), for white and tinted papers.
- SIBELL and MOTT, New York (United States, 339, p. 1212), for their specimens of account-books.
- SIMIER, J., 38 Rue de l'Arbre Sec (France, 693, p. 1212), for bookbinding.
- STARKE and Co., Montreal, Canada (Canada, 191, p. 968), for specimens of ornamental printing.
- STARR, C., New York (United States, 88, p. 1438), for binding works for the blind, with thickened margins to prevent the embossing from being pressed out. The specimens exhibited are said to have been bound by the machines, 88, United States Department.
- TURNBULL, J. L. and J., Holywell Mount, Shoreditch, London (45, p. 540) for drawing-boards.

VANDERDORPEL and SON, 3 Rue Chapon, Paris (France, 712, p. 1213), for various articles of fancy stationery.

VINCENT and TISSERANT, 21 Rue Michel le Comte, Paris (France, 730, p. 1215), for sealing-wax, fancy wafers, and writing-inks.

WALKER, E., and Co., New York (United States, 123, p. 1441), for a Bible elaborately bound and ornamented, with a recess for a family register inside the covers.

WATERLOW and Sons, 66 London Wall (46, p. 540), for specimens of account-books.

WEBER, J. B., Offenbach, Grand Duchy of Hesse (Grand Duchy of Hesse, 43, p. 1128), for specimens of marbled papers.

WODKESPOON, J., Portugal Street, Lincoln's Inn Fields, London (159, p. 547), for improvements in ledger binding, by the introduction of patent vellum cloth bands.

WOLFF, E., and SON, pencil manufacturers, 23 Church Street, Spitalfields, London (Class I., 68, p. 128), for crayons and pencils.

#### MONEY AWARDS.

The Jury have awarded the sum of 10*l.* each to the undermentioned workmen, as the most appropriate recognition of their skill and taste.

BUDDEN, E., bookbinder, Cambridge, exhibitor, (97, p. 544). The workman who bound an album, elaborately ornamented, in which taste and good work were displayed.

NEIL, R., journeyman bookbinder, North Bank Street, Edinburgh (91, p. 543), for the care, industry, and perseverance displayed in binding an imperial 4to Bible in cream morocco, under great disadvantages. The work was executed at his own home, after his daily occupation, by gas-light, in the winter; and notwithstanding these difficulties, a degree of excellence was attained.

*Associate Jurors.*

— MARNAS, Lyons, France.

SAMUEL SMITH, Bradford.

THE Jury of Class XVIII., in accordance with their instructions, report as follows on the various specimens of printed goods placed in the Exhibition, the whole of which they have carefully and minutely examined. The productions of the English and Scotch printers came first under their observation. Ireland has now only one or two small print-works: she had some rather extensive ones within the last twenty years, but during that time they have been gradually closed. Before remarking on the present productions of the English and Scotch printers, the Jury can hardly help referring to the changes in the trade within the last-named period, dating from the repeal, in the spring of 1831, of the very heavy duty on printed cottons. The entire production of the trade in England and Scotland (Ireland paid no duty for home-consumption) was then, as shown by Parliamentary returns, rather more than eight million pieces per annum. The reduction of a duty amounting to the average to fifty per cent. gave an immediate impulse to the trade, and within ten years from that date it appears that the production of Great Britain was doubled. Since that period no materials exist which afford sufficient data for an accurate account of its progress; but it is calculated that the trade, which in 1830 produced eight million pieces per annum, now probably produces not less than twenty millions yearly. Great changes in style and taste would necessarily be consequent upon such an increase in quantity. Very great improvements have been effected in the material printed upon. The regularity and evenness of fabric, in calicos made by the power-loom, of all qualities down to the very cheapest, give the English printer a fabric for the use of the middle classes, which places him decidedly above the competition of the whole world in this most essential branch of his trade.

The impulse given to the trade, followed perhaps by excess of supply and strong competition, caused a great reduction in price. To meet this, machine-work was generally substituted for block-printing. The engraver was stimulated (here, too, machinery lent its aid), chemical discovery (English and foreign) was not wanting, and the result was a large and cheap supply, chiefly of fine class plate-work, beautifully and exactly executed; or in one, two, three, or four colours, in permanent madder-work; as well as in a larger number of colours,

printed at once in more showy and fugitive steam-colours.

These changes led to the encouragement of a less showy taste than that for chintz block productions, and to a preference for goods of a more elegant and quiet character. Some of the staple productions, such as the navy-blue print, largely consumed for domestic wear throughout the country, almost entirely disappeared, being superseded by the very general use of the purple madder prints.

It should be observed that at this date the English printer borrowed extensively from the style of his French competitors. The printers of the then called Swiss prints (really French goods, produced in Alsace) were unrivalled in their pink and purple machine work. These articles, even for years afterwards, were imitated successfully by a few only of the first-class English printers; whereas now the progress of the trade in scientific knowledge, so patent to all, has enabled almost every printer in England and Scotland to produce them more or less successfully.

These goods, which were exported by the French, and met with in almost every capital city of the world, are now supplied in much larger quantities by the English printer, and to them has been added the supply of a new and increased variety of low-priced prints of a similar class. It is an interesting and curious fact, that the taste in almost every market has changed and improved with the reduction of price.

The English printer has also drawn largely upon his French rival during the same period, for another trade which he has likewise, by the aid of the manufacturer and his machinery, done much to make his own. France has long been famous for her beautiful fabrics in fine wool, in wool and silk challés, and in delaines. These expensive and costly goods, made of the finest wool, and requiring great care in execution, have been produced with a taste in colouring and design worthy of the beauty and elegance of the material. With them, France supplied and led the taste of all the civilized markets of the world. An article so costly was naturally of limited demand. The capital and machinery of the English printer have, then, been brought to bear on this branch of the business. Cotton has been introduced into the

fabric, and a beautiful substitute, at a low price, replaces the more costly all-wool material of our neighbours; thus obtaining the desired cheapness and beauty. Block-printing on this material (the English wool and cotton-de-laine) was for some time the only mode adopted; but machinery has since been adapted to it; and the English printer now offers it at a low price, in every market, and creates a demand which the high-priced one would never have known. The cheaper article has brought with it no corresponding declension in taste: quite the contrary, the greater demand, and the increased power of execution obtained by machinery, have led to various novelties in style.

The English printers have naturally exhibited such articles as they thought would look best in an Exhibition, and be best appreciated by the public. This in a great degree accounts for the absence of the large variety of those cheaper printed goods which form, after all, the great bulk of the English print trade—the staple one, by which she commands almost exclusively all neutral markets, and maintains her position for superiority and cheapness of produce.

Some opinion will be expected from the Jury as to the causes of superiority in the *finer* classes of French goods.

England received the art of calico-printing from France at the end of the seventeenth century, derived previously by the latter from Central Germany, which had been for some time the seat of the art, originally obtained from Egypt and the East. The trade was first introduced into the neighbourhood of London; but after a period of about sixty or seventy years it gradually decreased there, and yielded to the competition from the then newly-established works in Lancashire, which were aided by cheaper fuel and labour. These assumed an importance as they extended themselves, in printing on the newly-discovered fabric of cotton calico, just becoming the staple manufacture of that county. A few print-works yet remain in the neighbourhood of London, employed chiefly on very fine shawl and silk-handkerchief printing. The English printer, encouraged by his abundance of fuel, cheap labour, and facility for obtaining the largest supply of calico, has naturally fostered a trade suited to his machinery and capital, which is a complete contrast to the very different class best suiting the French printer to produce. The more limited and costly branch of the trade has naturally found its chief market in France. Paris has ever led the fashion of the world in female dress, and fashion has only a remote influence on inferior classes of goods. France is well supplied with cheap and skilful hands, well practised in the manipulation of fine and delicate fabrics upon which machinery cannot so well be brought to bear—in some measure, perhaps, because the demand does not repay a large outlay. Singularly enough, that country having the superiority in production in fine goods, possesses also an advantage over the British printer in demand, having our market *free* for her goods, whilst the English is prohibited from hers, and is denied the advantage of manufacturing for French taste and consumption.

The French, in proportion to their productions, supply much more largely for the highest class—a class, be it remembered, influenced by fashion, eager for novelty, and tempted by variety. The English supply, in proportion to their production, much more largely for the wear of the middle and lower classes all over the world, many of whom have conventional and national peculiarities of garb not easily affected by novelty. Hence arises the very natural distinction between the tastes of the two nations. It will be admitted, perhaps, that in every article owning the influence of taste, much greater advance has been made of late in the productions suited for the use of middle class-consumption, and upon which the beautiful accuracy of mechanical skill has been brought to bear, than in the higher class of goods, in which manual labour is still chiefly used. The blocked muslin of to-day is no better in taste, and but little so in execution, than the specimens of a hundred years ago.

Without referring to the samples shown by any particular British Exhibitor, the Jury consider that there are

to be found amongst them very fine specimens of work and taste in *barèges*, in woollen fabrics of different kinds, and in muslin goods,—very good first-class work in blocked de-laine goods (the woollen and cotton fabric), equalling, perhaps, in brilliancy of colour, any specimens (either of British and foreign goods) printed on wool alone, showing a triumph of art justly due to the English printer, viz., the giving an equally sound colour on a mixed fabric, composed of vegetable and animal substances. Choice specimens of machine-work on de-laine, in four, five, and six colours, are shown in some of the collections,—various assortments of the staple calico print trade, in madder-work, permanent and bright in colour, together with specimens of garancine dyed goods, in variety of machine work, all displaying considerable advance in taste, neatness of pattern, and execution; being fine specimens both of engraving and printing, and well representing the regular and standard productions of the houses exhibiting them. In the lower class of cheap machine-work, though an equally valuable branch of manufacture, as supplying a most extensive trade both for home and export, the Jury regret (owing to reasons they have before assigned) that no specimens are exhibited.

Some few good samples of English furniture-prints are shown. Perhaps it may be affirmed that this is a decreasing trade (except in very low goods for export, of which there are no specimens); and that woven damasks of considerable beauty, and comparatively cheap in price, have in some degree superseded the use of calico printed furniture.

A fact indicating the change in the English print-trade, before alluded to, may here be noted as further corroborating its progress in chemical science and machinery within the last twenty years. It will be admitted by the older members of the trade, that had there been an Exhibition in 1831 of English prints, it would have consisted chiefly of fine first-class blocked madder-work, and been confined to the productions of a few printers, who at that time stood far in advance of their brethren. In 1851 the Exhibition shows scarcely a specimen of block-work on calico, but a great variety of ingenious machine-work by a number of first-class printers.

Special reference is made to the variety of specimens of Turkey-red printed and dyed fabrics, in the English, French, and almost all the continental assortments. Originally, as the name implies, it was a Turkish red, produced at Adrianople. Its brilliant and permanent colour secures for it a steady consumption in many markets, and a high average of excellence is shown in its production.

Another branch of the print trade, which has its chief seat in the neighbourhood of London, though also pursued in Lancashire, Cheshire, and Scotland, is that of printed silk handkerchiefs. This, too, is originally of eastern origin, and is still an article of considerable import, both in the Corah cloth (the grey for printing upon), and in the finished printed Choppah and dyed Bandanna. Great changes have taken place in the relative imports: that of the printed handkerchief having gradually decreased in the last sixteen years to about one-fifth, whilst the import of the Corah has nearly trebled, an equal quality of the same description of cloth, and also an inferior one, being largely made in England—showing in this article, also, a progressively-increasing print manufacture.

This trade has been carried on for some years in Germany; but that country consumes chiefly English goods. France, too, within the last few years, has striven to establish a trade in printing these goods, and has made some progress in the inferior descriptions: previously she was indebted to this country (from which she still continues to import) for them. Selections are shown in the British department, excellent alike in fabric and execution, and embracing every variety of style in a trade demanding a regular supply, from the old imitation oriental colouring and patterns, to the fancy picture handkerchief, delineating in the present instance, as its latest novelty, variously-tinted representations of the Crystal Palace.

The remarks of the Jury on the English print-trade naturally include so many references to the state of the

French, as to limit very materially the separate notice which, from its importance, the latter demands.

The Jury have alluded to the high excellence shown in the finer goods of France. The absence of all middle and lower class French prints in the Exhibition, in fact of any specimens of the productions of the city of Rouen, is remarkable, as confirming the views already expressed. The French printer has not the advantage of cheap and well-made calico: he is, debarred by cost from the advantages of extended foreign markets.

The Jury refer with pleasure to the contributions made by the French printers to the Exhibition, and commend the superior taste with which they are arranged—a taste doubtless improved by the experience they have acquired at the periodical French Exhibitions.

The character of the French goods, of course, differs from that of the English, as, being more confined to the expensive class, the taste is necessarily of a higher order, and therefore presents a display more striking to the general observer. The Jury refer especially to the very fine printed furnitures, exquisite alike in taste and execution; to some very beautiful dresses of difficult and elaborate block-work on all-woollen fabrics; and to the general assortment of finer cotton prints, varying in some degree from similar English prints of the same class, because produced on finer and more costly cloth. Here, as in the English department, the entire absence of all lower-class goods, suitable to the wear of the artisan and peasant, is to be regretted.

The Jury notice beautiful specimens of *yarn-printed silks*, printed on the warp thread before weaving—an article among the finer silk goods which is well adapted for displaying that beautiful arrangement of colour and design, for which France is so justly celebrated. One or two specimens of printed silk handkerchiefs are shown, more especially referred to in the report on English goods of the same class.

Some statistical remarks on the progress of the French print-trade would have been introduced here, but the Jury regret that they have not been able to obtain any official information on the subject. Holding the first rank in taste, and second in amount of production, of the European nations, the progress and state of the French trade must form an interesting subject of inquiry.

The Jury would next allude to the interesting contributions from Switzerland, presenting excellent specimens of muslin and calico work, block and machine, some of them unsurpassed in execution by any in the Exhibition. They are specially worthy of notice as the manufactures of a country which first ventured to rely upon natural protection alone. Till within the last twelve months, Switzerland had no duties on imported prints; latterly, however, she has imposed a small fiscal one of about 2½ per cent. There is reason to believe that the abuses producing these goods have successfully introduced them, for years past, in competition with French and English, into various neighbouring markets in Central Europe.

The printed goods from Russia, Prussia, Austria, the Zollverein, Hamburg, Sardinia, Portugal, Turkey, and the United States of America, exhibit fewer varieties of production, of unequal merit, and each prepared chiefly for their respective markets.

The Egyptian contribution of printed goods is curious, as presenting nearly the rudest modern manufactures, the products of English machinery, and partly of English workmen; exhibiting the germs of the revival of a trade in a country which certainly possessed the art of printing and dyeing mordanted colours 1800 years ago.

The last and most inferior specimens of printing are those of Central India, exhibited by the East India Company. They deserve attention as the productions of a country the most ancient in the history of the print-trade, and which, 130 years ago, contributed nearly all the fine printed chintzes then worn by the higher classes, which so much superseded the use of other fabrics, as to excite a popular feeling against them and all printed goods; so that the Government of the day, yielding to the clamour, actually passed an Act through Parliament, prohibiting the wear of all printed calicos whatever,—an Act which disgraced the statute-book for ten years.

One fact, highly creditable to the character of the Exhibition, and the Exhibitors of printed fabrics, the Jury would wish to state. They believe that amongst the variety of British and foreign printed goods, there are not to be found any specimens prepared specially for the Exhibition, or for show merely, but only such selections from the work of each house as honestly represent its average produce.

The decisions of the Jury, on the merits of the articles exhibited, have been arrived at from a consideration of the wants of the consumer alone, always remembering that it is his taste in its highest form, and not any critical standard, which it is necessary for the printer to consult and supply. The chief object of the Exhibition is to bring together the finest articles already produced, and by presenting these side by side for comparison, to suggest new forms and varieties, and to induce an increased demand from various countries.

In their report on the specimens of dyed goods placed before them, the Jury will remark, first, on those of Great Britain (India included).

Here will be found dyed woollen articles, as well as numerous specimens of mixed fabrics (woollen and cotton, woolen and linen) in piece-goods of great variety and purity of colour. Specimens of silk and wool in the hank, equally diversified in colour and in gradation of shade. The silks used in the manufacture of Spitalfields, Macclesfield, Manchester, Coventry, &c. The wools for the manufacture of carpets and woollen and mixed fabrics, in Kidderminster, Glasgow, Bradford, Leeds, Halifax, Norwich, and elsewhere.

The French collection of dyed goods presents a beautiful variety of merinos, but none of mixed cotton and woollen fabrics. Varieties of dyed wools for the manufacture of Parisian shawls, and of silk in the hank, showing that purity of colour, especially in the lighter shades, which contributes so greatly to the success of the Lyonesse manufactures.

Saxony, Prussia, Austria, and Russia, have sent many varieties of dyed yarns.

In their respective compartments will be found the merinos of Saxony and Russia.

Numberless varieties of woollen dyed yarns for the Berlin carpets; and from Vienna, for the manufacture of shawls and damasks.

Switzerland exhibits numerous specimens of the dyed silk used in the extensive manufactures of Bâle and Zurich.

China, one of the earliest known silk manufacturing nations in the world, is represented on this occasion by a complete assortment of the dyed silks used in her manufactures.

Having briefly referred to the specimens of dyeing, it may be remarked that this art has participated in the great industrial movement of the last twenty-five years; and of this, the dyeing of mixed fabrics composed of animal and vegetable substances affords a striking proof. The great difficulty of presenting a bright, sound, and uniform colour, on fibres having different affinities, has been overcome. In the various modes of dyeing silk and wool, Prussian-blue, with a tin mordant, has been substituted for indigo with complete success. The colours extracted from various dye-woods, have, by a judicious application of oxidizing agents, been rendered brighter and more permanent. Preparations of tin, formerly employed for fine colours only, are now in general use, and furnish the means of multiplying the shades of bright and permanent colours.

Particular reference ought to be made to the great improvement in the bleaching or whitening the silk fibre intended for the dye-bath. It is well known that the paler shades of colour cannot be produced bright and clear unless on a silk of pure white.

In presenting a list of the names of Exhibitors to whom the Jury award the Prize Medal, in woven, spun, felted, and laid fabrics, when shown as specimens of printing or dyeing, it appears inexpedient to mention, otherwise than in general terms, the points of excellence upon which these awards are founded.

The greater number of Exhibitors show specimens of

printing on a variety of cotton, woollen, and mixed fabrics: reference however is made to those only which appear most remarkable.

*In printing.*—The Prize Medal is awarded for various degrees of excellence, in design, execution, and brilliancy or permanency of colour, or both.

*In dyeing.*—The Prize Medal is awarded for brilliancy, permanency, and uniformity of colour. The Jury make these awards to printers and dyers only.

#### PRINTING.

The Jury award Prize Medals in this department to the following Exhibitors:—

BERNOVILLE, LARSONNIER, and CHENEST, Paris (1548, France, pp. 1250, 1251), for fancy fabrics printed in steam colours for dresses.

BLACK, JAMES, and Co., Glasgow (51, p. 556), for printed muslins, jaconots, and fancy fabrics.

BLECH, STEINBACH, and MANTZ, Mulhouse (29, France, p. 1172), for printed mousseline-de-laines (all wool), calicos and jaconots, in madder colours.

BOCKMÜHL BROTHERS, SCHLIEFER, and HECKER, Elberfeld (606, Prussia, p. 1084), for printed calicos.

BOSNI, J., St. Veit, near Vienna (239, Austria, p. 1019), for fancy fabrics printed in steam colours for dresses.

CHOCQUEL, LOUIS, Labriche (90, France, p. 1175), for fancy fabrics printed in steam colours for dresses.

DALGLEISH, FALCONER, and Co., Glasgow and Manchester (27, p. 555), for machine-printed calicos.

DE LA MORINIÈRE, GONIN, and MICHELET, Paris (1583, France, p. 1252), for fancy fabrics printed in steam colours for dresses.

DOLLFUS, MIEG, and Co., Mulhouse (1191, France, p. 1234), for printed muslins and jaconots, madder, and other colours; printed mousseline-de-laines (all wool).

EVANS, DAVID, and Co., London (1, p. 554), for printed silk handkerchiefs, and printed table-covers.

GODEFROY, L., Puteaux (Seine) (1252, France, p. 1237), for fancy fabrics printed in steam colours for dresses.

GROS ODIER, ROMAN, and Co., Wesserling (248, France, p. 1188), for printed muslins and jaconots in madder and other colours; and printed mousseline-de-laines (all wool).

HARTMANN and SON, Munster (Haut-Rhin) (256, France, p. 1189), for various fabrics printed in madder colours.

HOYLE, THOMAS, and SONS, Manchester (36, p. 555), for machine-printed calicos.

INGLIS and WAKEFIELD, Glasgow (4, p. 554), for machine-printed mousseline-de-laines and barèges.

JAPUIS, J. B., and SONS, Claye (274, France, p. 1190), for printed cottons and chintz colours for furnitures.

KROCHLIN BROTHERS, Mulhouse (1634, France, p. 1255), for printed mousseline-de-laines (all wool), printed calicos, in madder colours.

LEITENBERGER, FRANZ, Cosmanos, Bohemia (187, Austria, p. 1017), for printed calicos, in madder colours.

LITTLER, MARY ANN, Merton Abbey (8, p. 554, as exhibited by Mr. Wilkinson; and 282, p. 590, Classes XII. and XV.), for printed silk handkerchiefs.

SALE, J. N., Manchester (39, p. 556), for printed cotton shirtings.

SCHLUMBERGER, jun., and Co., Haut-Rhin (1481, France, p. 1247), for calicos and jaconots printed by cylinder.

SCHWABE and Co., Manchester (41, p. 556), for printed calicos, madder, and garancine work.

SCHWARTZ and HUGUENIN, Mulhouse, Haut-Rhin (1003,

France, p. 1227), for printed cotton chintz colours for furnitures.

SIMPSON and YOUNG, Manchester (47, p. 556), for mousseline-de-laines (cotton warps), printed by cylinder in six and seven colours; and calicos printed in steam colours.

STEINER, C., Ribeaupvillé (383, France, p. 1195), for Turkey red, plain dye and printed.

STEINER, T. and Co., Church near Accrington (37, p. 555), for Turkey red, plain dye, and printed.

THOMSON BROTHERS, and SONS, Manchester (25, p. 554), for printed mousseline-de-laines (cotton warps).

VAUCHER, DU PASQUIER, and Co., Cortaillod (36, Switzerland, p. 1268), for calicos and jaconots printed by cylinder.

WELCH, MARCETSON, and Co., London (7, p. 554), for printed silk handkerchiefs.

WELCH, THOMAS, Merton Abbey (18, p. 554), for printed table-covers.

ZIEGLER and Co., Winterthur (146, Switzerland, p. 1275), for plain Turkey red dye.

#### DYEING.

The Jury award Prize Medals to the following Exhibitors in this department:—

ARMITAGE, G., and Co., Bradford (146, Classes XII. and XV., p. 492), for Orleans and Cobourg cloths, mixed of cotton and wool.

BERGMANN and Co., Berlin (106, Prussia, p. 1054), for Berlin woollen yarns, dyed in various colours.

FÉAUX-BÉCHARD, V. A., Passy-près-Paris (Seine), (198, France, p. 1183), for skein-dyed fine woollen yarns for shawls.

FRANCHILLON, —, Paris for merinos, exhibited by Parturle-Lupin, Seydoux, Sieber, and Co., manufacturers, Coteau (1381, France, p. 1242).

GUINON, A. P., Lyons (1263, France, p. 1237), for skein-dyed silk in various colours; bleaching silk and the application of picric acid.

HOWE, J., and Co., Coventry (36, Class IV., p. 197\*), for skein-dyed silk in various colours.

LE LIEVRE, H., London (60, p. 557), for skein-dyed black silk.

PARTRIDGE, N., Stroud (212, Classes XII. and XV., p. 496), for dyeing broad cloths of different colours on each side.

RIPLEY and SONS, Bradford, Yorkshire (148, Classes XII. and XV., p. 493), for Orleans and Cobourg cloths, mixed of cotton and wool.

VESSIÈRE, A., Puteaux, near Paris (720, France, p. 1213), for merinos.

WEGNER, T. R., Bale (155, Switzerland, p. 1276), for skein-dyed silk in various colours.

The Jury award the Prize Medal to Mr. JOHN MERCER, Accrington (48, p. 556), for the beautiful application of a scientific principle in preparing various textile fabrics, strengthening the material, and at the same time wonderfully increasing the brilliancy and intensity of the colour when dyed or printed. The results are exhibited in the goods shown by Mr. Mercer. A Council Medal has been awarded in Class II.

The Jury would have felt it a duty to recommend this inventor for the Council Medal, if his discovery had been extensively applied in manufacture.

EDMUND POTTER, REPORTER.

## CLASS XIX.

REPORT ON TAPESTRY, INCLUDING CARPETS, FLOOR-CLOTHS, &c.,  
LACE, FANCY EMBROIDERY, AND INDUSTRIAL WORKS.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

Dr. POMPEIUS BOLLEY, *Chairman*, Switzerland; Commissioner.  
 PETER GRAHAM, *Deputy Chairman*, 37 Oxford Street; Carpet Manufacturer.  
 RICHARD BIRKIN, *Reporter*, Nottingham; Lace Manufacturer.  
 D. BIDDLE, 81 Oxford Street; Lace-maker.  
 ANTONY FESSLER, Switzerland.  
 THOMAS SIMCOX LEA, J. P., Astley Hall, Stourport; retired Carpet Manufacturer.  
 ROBERT LINDRAY, Belfast; Sewed and Embroidered Muslin Manufacturer.  
 FRANÇOIS A. WASHER, Belgium; Merchant at Brussels.

M. ELLISEN, Frankfort-on-the-Maine; Merchant. (Proxy for M. Falk, Zollverein; Manufacturer.)

FELIX AUBRAY, Paris; Merchant. (Proxy for M. Lalnel, France; Inspector of Manufactures; Member of Central Jury.)

THE Jury appointed by the Royal Commissioners for Class XIX. having completed their inspection of the various articles, and awarded the prizes placed at their disposal, beg to append to their awards some facts and observations relative to the rise, progress, and present condition of the branches of industry that have come more immediately under their notice.

The Jury are of opinion that the products included in Class XIX., from many countries, are more numerous and various, and differ more widely in price, than those comprised in any other Class. Their task has, consequently, been one of much labour and difficulty, having occupied two months of unceasing attention in seeking out and examining everything said to belong to this Class (the goods from foreign countries not being classified in the Catalogue), and in many cases having to seek for them in other Classes, being most anxious that no omission on their part should be made, and that ample justice should be done to the Exhibitors.

The great variety of products before-referred to will account for what may at first sight appear too great a degree of liberality in the awards.

In deciding upon the merits of the articles exhibited, they have taken into consideration *novelty* of invention, novelty and beauty of design, excellence of manufacture or execution, cheapness, durability, and usefulness.

They have recommended those Exhibitors who have displayed one or other of those qualities by Honourable Mention, and have awarded Medals to those who, in their productions, have combined several of them.

The Council of Chairmen having confirmed the recommendation of a Council Medal in the case where the fabric was new, and of great beauty and utility, but not in those cases where great beauty of design was united with the highest degree of excellence in execution, and applied to articles of commercial importance: the names of those Exhibitors whose productions were peculiarly distinguished are referred to in the Report.

Having made these preliminary remarks, the Jury proceed with their observations upon the various branches of industry that have come under their notice.

## BRITISH LACE.

**Bobbin-Net Machinery.**—Nottingham, long celebrated for her machine-made lace, has, on this occasion, furnished indubitable proofs that her manufacturers and artificers have been progressing in the same ratio as those in most other branches of industry, during the last half-century. Fifty years ago, lace made by machinery was mostly from the point-net and warp-machines (both

modifications of the original stocking-frame); since that period, there have been incredible sums of money expended, many valuable lives sacrificed by intense study, hundreds of patents taken out, and nearly as many differently-constructed machines built for the production of plain and ornamental lace of every description. It has been matter of astonishment to see how quickly one inventor has succeeded another, and by simplifying or modifying his machines rendered useless those of his predecessor. It may be stated, that in none of the textile fabrics have there been so many combinations of machinery used to effect the purpose as in the making of lace, commencing with the stocking-frame, to which was added a Tickler machine, then the point-net machine, warp machine, Mechlin plait machine, and many others. All of these (except the warp machine), disappeared for the purpose of making lace when the bobbin-net machine was introduced, and its capabilities for making both plain and ornamental lace became developed. The bobbin-net machine is so called from the thread that makes the lace being partly supplied from bobbins, and partly from a warp, the bobbins being made to pass from front to back, and back to front, while a lateral motion is imparted to the warp threads, thus causing one series of threads to wrap round the other. After innumerable attempts to make bobbin-lace, the first successful machine was made and patented by John Heathcoat, in 1809. This machine, although novel in its construction, and the first enabling one series of threads to pass round the other, was complex in its arrangements, and required sixty motions to complete one hole, the same being now made with six. The cost, also, of the production was such as to circumscribe its use, for we find in 1815, when the machines of this description had increased to 140, one square yard of the produce was worth 30s.; the same quantity can now be purchased for *three pence*.

But so rapidly, from this period, did the machinery increase and trade extend, that in 1831 the capital employed in the bobbin-net trade, from careful inquiries made by a townsman, W. Felkin, Esq., was 2,310,000*l.*, giving permanent employment to 211,000 persons. It is desirable to state that, up to this time, little less than plain net and quillings had been produced by the bobbin-net machine. After repeated efforts on the Leaver, circular, pusher, and traverse warp machines, in 1831 and 1832, plans were adopted to purl and bullet-hole the edges of narrow laces, finishing them afterwards with a gimp-thread with the needle; the same was done on the pusher machine, and shortly after on the circular. The rapidity with which new articles were brought out, first by one

machine and then by another, was astonishing, each discovery leading the way to something more novel. At this period, also, a patent was taken out by William Sneath, of Hyson Green, and sold to James Fisher, Esq., of Radford, for spotting on the circular machine; soon after another was taken out by Mr. Freeman, of Tewkesbury, for spotting on the traverse warp; and shortly after a third by R. Birkin, of Basford, for the same thing on the Leaver machine.

Many efforts were made by Draper, and others, to apply the Jacquard machine to the bobbin-net for the purpose of ornament. Several patents had been taken out for this purpose, but no successful arrangement had been effected till about 1839, when a pusher machine was worked with cards the width of the net, by Mr. Wright, of Radford: the same application was made to the circular machine by Mr. Crofts, who has taken out several patents for various improvements in nearly every description of bobbin-net machinery.

The application of the Jacquard still progressed slowly till 1841, when a plan discovered by Hooton Deverill was bought and patented by Messrs. Biddle and Birkin, for applying the Jacquard to the guide bars; and so rapid has been the application of the Jacquard since that period, that at the present time there is scarcely a machine at work without it (except those adapted purposely for plain net), either applied to the bars, or along the width of the machine, and from that period the trade commenced anew, producing every description of pattern on all the various descriptions of net known, particularly on the plain-net, that had been made and patented in 1838 by Mr. Crofts, but was not extensively manufactured till the successful application of the Jacquard. Such an impetus did the trade receive from this, that hundreds of machines which were useless, or "worked up," as the trade termed them, were brought into active and profitable use; many of their owners, after spending from 80*l.* to 100*l.*, being able to realize this outlay in three or four weeks (if put on with a saleable pattern). No sooner was the Jacquard machine successfully adapted to the bobbin-net machine, than new sources of manufacture gradually developed themselves, such as flounces, scarfs, shawls, window-curtains, &c., &c.; but, to succeed in these articles, tasteful and elaborate patterns were required, equal to the French and other foreign productions of the same kind: manufacturers had in many instances to resort to those places for designs. This want of clever local designers caused the same anxiety to be manifested by the makers of machine-made lace that other manufacturing districts had evinced; and the same cordial assistance from the Government was afforded in establishing a school of design in Nottingham.

Though many for the first two or three years thought this school comparatively useless, it has proved that it was only sowing the seeds for extended usefulness, as several young men, that have had no other means of learning designing, and creating a taste for the fine arts, are now filling important situations, and receiving liberal salaries; and there is no doubt that at the present time our local artists are capable of producing designs equal to the French, Swiss, &c.

We may be told, the display of lace goods in the Great Exhibition does not demonstrate this statement; but it must be borne in mind that the manufacturer of machine-made lace has to have his patterns adapted to suit the various markets; and they know from experience, that patterns that would suit the French would not be saleable to any large extent in the English market (and English-made lace being prohibited in the French market, it is useless to adapt our patterns to their taste). In fact, there requires one style for the London market, another for the provinces; one for North America, a different one for South America, and so of all the various markets to which we export our produce.

It will, therefore, be perceived, that the French are rarely employed in designing, except for the Parisian taste, where our designers have to suit the tastes of nearly all the markets in the world.

Judging, therefore, from the beautiful patterns now produced, their suitability to the markets for which they

are specially designed, and the rapid manner in which this part of the trade has extended, we think it right to state here that the Government School of Design has materially assisted the enterprising manufacturer and artisan.

At the present time, amongst the infinite variety of articles manufactured by the bobbin-net machines, are—

1st. Black silk piece net ornamented, shawls, scarfs, flounces, trimming laces, blondes in white and colours, some wholly finished on the machines, others partly by machinery, and embroidered afterwards.

(Up to 1845, Saxony exported largely the lower class of these, and France the more expensive into this country; but so perfect are they made, so much improved in design, so effective for useful purposes, and lower by from 75 to 90 per cent. than the class of hand-made articles they represent, that we not only supply our home market, but have exported 150,000*l.* worth annually, during the last four years, to foreign markets, principally the American, and not a few find their way into France, although wholly prohibited by that country.)

2nd. Cotton edgings, laces, and insertions, linen laces in imitation of white pillow lace, muslin edging and laces, fancy piece net, spotted net, plait net, in imitation of the costly Valenciennes lace.

3rd. The third class is of curtains in imitation of the Swiss curtains, bed-covers, and blinds; and although this branch of trade is new, having only been introduced in 1846, yet from the extent it has already attained, employing above 100 machines, and from the display of goods exhibited, excellent in design and good in texture, it promises not only to be an important but an improving department of the lace trade.

4th. The fourth class includes silk and cotton, plain net Mechlin grounds, blonde, Brussels, or extra twist: this is a branch of much importance, employing regularly upwards of 2,000 machines; one owner, J. Heathcoat, Esq., M.P., having 300, principally making silk net, or Paris blonde. To this gentleman the trade owes much for his zeal and perseverance in discovering the method of imparting that dress or finish to his nets, formerly known only to the French, and the accomplishment of which is now giving permanent employment to many thousands of workpeople.

The numerous and various specimens of Nottingham manufactures in the Great Exhibition, their generally useful character and extraordinary cheapness, combined with very considerable taste in design and excellence in execution, must tend to still further develop the ingenuity and extend the trade of the locality.

The description of machines at present in use are the following:—

1st. The "*Leavers*," so called after John Leavers, the original constructor of this machine; a specimen of which, belonging to Mr. Birkin of Nottingham, is at work in the Exhibition.

Most of the articles included in the first and second class productions are made from this description of machinery.

2nd. The "*Pusher*" machine, so called from having independent pushers to propel the bobbins and carriages from front to back, instead of pulling or hooking them, as in other arrangements.

From this description of machine are made shawls, scarfs, flounces, &c., of a superior quality, which require to have the pattern traced afterwards with a thick thread by women.

3rd. The "*Circular*," so called from bolts or combs on which the carriages pass being made circular, instead of straight, as in the straight-bolt machines, originally constructed by Mr. Morley, of Derby (late of Nottingham). From these machines are made the curtains mentioned in Class III., and the various descriptions of plain, spotted, and fancy nets.

4th. A few "*Traverse Warp Machines*," so called from the warp "traversing" instead of the carriages, as in the circular and pusher machines. These machines principally make spotted lace, blond edgings, and imitation thread laces.

There is a smaller number of machines now than in

1836, owing to many of the old narrow ones having been broken up and replaced by others, wider, more speedy, and of a superior construction. Though numerically less, the power of production is materially increased: in addition to this, arrangements are now made in many of the machines for completely "finishing" their produce, i. e., embroidering; thus dispensing with a great number of "lace-runners," which will account, in a great measure, for the apparent diminution in the number of hands employed in 1836.

There are now in full operation 3,200 bobbin-net machines; the total number of quarters 34,382, giving employment to 5,556 men, 6,859 women and children, representing a capital of 1,329,445*l.* This is exclusive of buildings and requisite machinery for working the same; and also of machinery and stock for silk-throwing, cotton-spinning, dyeing, bleaching, and dressing; for Smiths' bobbin and carriage guide, comb and point makers, embroidering, carding, mending, &c., estimated at 1,616,500*l.*, in which occupations about 113,300 hands are regularly employed.

Total capital 2,965,945*l.* Total number of hands employed 193,015. Annual amount of business returns 2,300,060*l.*

These statistics are the result of extensive and careful inquiries made purposely for the occasion; and are as accurate as such documents can be, considering the difficulty, in some cases, of obtaining all the facts from manufacturers.

The "Warp Machine."—In addition to the bobbin-net machine for making lace, there is also the warp machine, several productions from which are exhibited on this occasion, of a novel and beautiful description.

The invention of the warp frame (about the year 1775) has been ascribed to four persons, Vandyke, a Dutchman; Mr. Clare, of Edmonton, near London; Mr. Marsh, Moorfields, London; and Mr. Morris, of Nottingham. Blackner (who was a contemporary), in his History of Nottingham, mentions three of these, and inclines to the opinion that Mr. Crane, who was a mechanic, was the first to apply the warp to the common stocking-frame. It must here be understood that, for the common stocking-frame, but one thread is requisite; whilst to the warp, a thread for each needle was employed, and hence it derived the name of "warp machine." The first articles attempted from the new application, were silk stockings, having blue and white zig-zag, or, as they were called (from the supposed inventor), Vandyke stripes; and this new kind of hosiery continued in considerable request for upwards of twenty-years. Purses were also made in considerable quantities after the same manner.

The first machines were about 16 inches in width, and they were merely the common stocking-frame, with the warp or new principle applied.

In the years 1784-5, a person named James Tarratt, considerably improved them by applying treadles to perform the requisite movements, and built them as wide as 44 inches, by which improvements the speed was doubled, and the width tripled. About this period, a Nottingham mechanic considerably improved the warp frame, by the application of the rotary motion, and the "cath" wheels to move the guide-bars, which are still known in the trade as Dawson's wheels: he employed several of his improved machines in the production of officers' sashes, braces, purses, and other elastic textile fabrics, the manufacture of some of which continues to this day. In the year 1796, a person named Roland invented a new fabric from the warp, which was patented by Mr. Barber, of Bilborough, near Nottingham. This fabric was used very extensively for pantaloons, sailors' jackets, and other articles.

This new manufacture rose to great importance, and large contracts for the Admiralty were supplied. In the year 1812, 500 frames were said to be employed in the midland counties in this article, which is still known as "Berlin," and is extensively used for the making of gloves. It is said, that in the year 1808, 1,800 point-net frames were at work in the neighbourhood of Nottingham. About this period, two persons of the names of Brown and Pinder, made silk lace from what they termed

an upright-warp frame (from the needles being placed upright, and not horizontally, as in the ordinary warp frame). In the year 1810, 120 of these upright frames were at work in Nottingham; and the wages of the workmen were very high, never less than 50*s.* per week.

In a very short period, lace was made from the horizontal warps; and the uprights were soon rendered useless. The first lace produced was of a very inferior description; and various attempts were made to improve it. At length, Brown and Copestake invented what was called Mechlin net, which, from its intrinsic excellence, soon entirely superseded the point net; and in a short time 430 frames were making it; the wages of the workmen averaging four guineas per week; whilst the cotton used was 15 guineas per lb. From this period the point-net manufacture declined, until it became quite extinct; and the warp machine was in the ascendant.

Soon after the introduction of Mechlin lace, an imitation of it was made by a Mr. Kirkland, which was known as "two-course" net; and another kind of silk lace known as "Blonde," invented by Daycock, appeared about the same time. These two kinds of silk lace subsequently attained to great importance, especially the latter, which still forms a considerable branch of the lace trade.

The blonde, soon after its introduction, became in great repute, and the workmen made enormous wages—it is said, as much as 10*l.* per week.

In the year 1819, the Mechlin disappeared; and soon after the two-course and blonde greatly declined until 1830, from the large importations of French silk-lace; the French method of dressing being much superior to our own.

The bobbin-net machine, which was invented and patented in 1809, had now become the great rival of the warp.

Cotton "Mechlin" lace speedily disappeared before the more approved manufacture, bobbin-net: and what from this new competitor at home, and large importations of silk lace from France, the warp trade may be considered to have fallen to its lowest state of depression. Numbers of the machines might be bought for the price of old iron; and many were broken up as no longer of use. Such was the state of this branch of industry when attention was directed to the ornamentation of lace on the machine. Hitherto, the lace or net had been made wholly plain, and was embroidered or "tamboured" afterwards by hand.

Driven from the plain by the bobbin-net, the warp was the first to attempt the ornamental; and has the credit of leading the way in what has become the most important branch of the lace trade. Boot, Roberts, Herbert, and Copestake were the earliest in the field, and laces with spots and bullet holes introduced first appeared.

A new kind of net also was produced, which was called "mock twist," in imitation of its rival the bobbin-net. From these sprang the tatting trade; and, suddenly, machinery which before was worthless, rose to a great value: many new machines began to be built; and these warp tattings gave quite a new impulse to the warp trade. Whilst the tatting trade was at its height in 1830-31, the silk blonde again revived under the patronage extended to it by the Court at this period. Machines were now constructed on improved principles; and rotatory action was successfully applied. These gradually superseded those worked by hand, and instead of old 44 inches wide, many from 100 inches to 150 inches were constructed. This state of prosperity continued for several years, until 1835-6, when the silk blonde and cotton tattings became greatly depressed.

The bobbin-net machine again outvalled its forerunner by producing superior ornamented laces; and Hestcoat's plain silk bobbin-net had now begun to take the place of Nottingham white silk blonde. Notwithstanding these, the unemployed warps found other and new channels. Some were making gimps, and a still greater number lace mitts and gloves, which, from 1836 to 1846, were in great demand; but these, during the last few years, have nearly become obsolete.

In 1839 the Jacquard was applied to the warp by

Draper, of Nottingham. The increased capability which this application gave, inspired new hope for the warp-lace trade of Nottingham. A new class of products of elaborate design was manufactured, such as shawls, scarfs, mitts, falls, laces, &c.; but latterly the products of the Twist machine have to a great extent supplanted them.

Great improvements were made in dressing silk lace. Mr. Dunncliff first followed the French method of working the silk in the single thread, and in the raw state, instead of the organsine thrown which had heretofore been used. The result of this change was soon felt. French-dressed silk lace, which had long been superior to ours was now equalled in whiteness and brilliancy; and at the present day, English-dressed lace is little, if at all, inferior to the best specimens from Lyons. Within the last few years, many new kinds of manufacture have been attempted from the warp, which deserve a special mention.

Elastic woollen cloth for gloves and other purposes is one of these. Henry Dunnington of Nottingham was the first who made it, and he has produced the best of this kind.

Many new kinds of elastic fabrics for gloves, both in silk and other kinds of material, have been made by Messrs. Ball and Co. A patent for velvet lace was obtained by Dunncliff and Dexter in 1845; but the making of velvet was not brought into practical operation until 1849, when Messrs. Ball and Dunncliff, and Messrs. Huines and Hancock, succeeded in making piece velvet suitable for gloves, the product at the present time being entirely used for this purpose.

During the past year the same parties have had granted a patent for making velvet in combination with lace; and for other novel weavings, specimens of which are shown in the Great Exhibition.

These latter may be considered as the latest improvements of the warp frame, which bring down our notice to the present period.

The number of machines now in operation, as far as can be ascertained, is about 1,400: 600 in the county of Leicester; 400 in Derbyshire, and 400 in Nottinghamshire, and are employed in the various branches as follows:—

- 150 blonde, and other silk laces.
- 150 cotton tatting.
- 550 Leicester hosiery, &c.
- 100 lace gloves and mitts.
- 150 woollen cloth, hosiery, purses, and various kinds of fabrics for gloves, &c.

1,100 Total.

The average widths of the machines employed in the Nottingham trade are from 90 to 100 inches (some few being as wide as 150), whilst those engaged in the Leicester hosiery trade, are generally from 44 to 72 inches.

The number of persons employed in the warp trade is estimated at 10,000, and the capital invested 360,000*l.*, making a return per annum of 700,000*l.* On a comparison with former returns, it will be observed, that the number of machines employed in the lace branches is considerably less, whilst in the hosiery and other miscellaneous articles the numbers have increased. A warp blonde-machine, 54 inches wide (which was about the average in 1830), would produce about 20 yards or 80 racks per week, which, when dressed, would be equal to about 50 square yards.

The power-machine belonging to Messrs. BALL, DUNNCLIFF, and Co. in the Great Exhibition, illustrative of the warp-lace trade, is capable of producing—working 12 hours per day—800 racks per week, which, when dressed, would be equal to about 1,200 square yards. A yard of 4-quarter white silk blonde, which in 1830 sold for 2*s.*, is now supplied for 6*d.*

LACE made by hand, as "HONITON," and "THREAD" or "PILLOW LACE," also "BRITISH POINT," TAMBOUR, and LIMERICK LACES.

**Honiton Lace.**—The description of lace termed "Honiton" is made by placing a perforated pattern upon a

pillow, and employing pins, bobbins, and spindles to twist and interweave thread in such a manner as to produce the required design. It was formerly confined to the production of simple sprigs and borders; but during the past twenty years considerable progress has been made, resulting in the manufacture of fabrics, displaying not only extreme delicacy of execution, but also beauty, and taste in design.

The Great Exhibition affords ample proof of this in the specimens of flouncings, shawls, scarfs, handkerchiefs, berthes, &c., which are there exhibited, varying in price from ten to two hundred guineas.

This striking change has not arisen from fortuitous circumstances, but has been mainly induced by eminent houses in the trade; who, to meet the taste required by their customers, have employed every means at their disposal to raise the character of this description of lace. They are fully alive to the conviction that the more the British manufacture becomes assimilated to the characteristics of the foreign (which are chiefly suitable, beautiful, and clearly-defined patterns, with refinement of execution), the more the demand for this lace will extend; and, proportionally with such increased demand, they will be induced to expend still larger sums, in order to produce a higher class of designs. They are further encouraged in their exertions by the fact that, although the British lace cannot boast of design so exquisite, and execution so delicate, as Brussels lace, it yet possesses remarkable and valuable qualities, inasmuch as it is produced perfectly white, does not change colour, and the price is very moderate.

The district in which Honiton lace is made extends about 30 miles along the coast of Devonshire, and about 12 miles inland. A very large number of persons (from 7,000 to 8,000) are now employed in producing it.

**Pillow Lace.**—"Pillow" or "Thread" lace, although made upon the cushion like Honiton lace, is distinguished from it by having both the pattern and the mesh made by hand, whereas, in Honiton lace, the pattern is made separately, and afterwards sewn on to machine-made net.

Not many years since a very considerable number of women and children were employed in its manufacture throughout the counties of Bedford, Buckingham, Northampton, and Oxford; but the demand having fallen off (being subject to fluctuation, like all articles dependent upon fashion), has caused this branch of the trade to suffer severely. Contemporary, however, with the diminution in the making of white-thread lace, an increased requirement for black lace occurred; the manufacture of which was introduced into the districts enumerated, and has been attended with marked success.

It would be difficult to supply any accurate statistics as regards the number of persons engaged in this manufacture, as the nature of the article enables the parties employed in producing it to carry on the operation apart from each other, and without interfering with a domestic or retired life.

It is deserving of consideration, that the worth of the actual material bears such a small proportion to the value of the article itself, as to make the amount paid for the labour expended in its production to be almost the sole cost. This industrial product, therefore, cannot fail to enlist sympathy on its behalf, as it furnishes, in comparison with its price, a surprising extent of employment and maintenance, and these benefits, moreover, are afforded to a class of persons who otherwise would have a difficulty in earning a livelihood. In exemplification of which it may be said, that the poor in lace-making districts are comparatively well off, and better provided for than in other localities.

**British Point Lace.**—British Point, tambour, and Limerick laces, possess alike considerable merit, and are very similar in the mode of their manufacture. These embrace the imitation of Honiton and Brussels lace, and are produced in shawls, scarfs, dresses, Court trains, flouncings, lappets, &c., exhibiting a beautiful display of chaste, elegant, and elaborate designs, and are well represented in the Exhibition.

"British Point" is chiefly made in the neighbourhood of London, and is very superior as an imitation lace.

"Tambour" is made principally at Islington, London, Coggleshall in Essex, and at Nottingham.

The "Limerick lace" is peculiar to Ireland, and has been produced in considerable quantity.

There is also another description of this lace, which has been brought to great perfection. It is made in various articles, and presents an excellent imitation of the old Spanish point.

The prospects of these branches of the British lace trade are at the present time highly encouraging; and there is no doubt that by careful attention in producing appropriate designs for Honiton lace, and the cultivation of a taste for refinement and elegance, the manufacturers of this lace will be most successful in their exertions to render this department of British industry eminently worthy of the increased admiration of ladies of rank and fashion, not only in this, but in other countries.

From the well-known character of the principal houses engaged in this enterprise, it may be confidently expected that Honiton lace will assume a position in the highest class of industrial art, combined with utility. Nor are the manufacturers of the other descriptions of lace mentioned in this Report at all behind in an energetic application of their resources, in order to excel in their various productions.

The decided improvement which has been made in the black laces, now so generally worn, has led to the introduction of a new and important feature in the fabrication of piece goods, such as shawls, scarfs, veils, coiffures, &c., the manufacture of which in "black point lace" has commenced within the last twelve months, and is carried on in the southern districts of Buckinghamshire. It has already been attended with marked success, and is deserving of special notice.

It is a gratifying reflection that the growing appreciation of the wealthy and refined class of the increasing merit of these really useful and ornamental articles of British manufacture gives suitable employment to a large number of females at their own houses, thereby increasing their comforts, encouraging habits of industry, and adding to the general prosperity of the nation.

#### ENGLISH, IRISH, AND SCOTCH SEWED MUSLIN EMBROIDERY.

The national importance of this branch of industry, its rapidly increasing extent, and the progress made in its manufacture, as evidenced by the number of exhibitors from the United Kingdom, and the varied merit of their productions, call for particular remark.

The articles exhibited by Messrs. D. and J. MACDONALD and Co., and Messrs. S. R. and T. BROWN, both of Glasgow, and Messrs. BROWN, SHARP, and Co., of Paisley, are very gratifying proofs of the excellence attained both in design and execution.

In taking a retrospective view of the trade, it is difficult to fix the precise date of its origin; but there is no doubt that in the year 1770, in Scotland, and 1780, in Ireland, the germs of it were in existence.

Towards the commencement of the present century the manufacture had so extended as to employ profitably the attention of eight or ten houses in Glasgow, and also a few in Belfast; but the trade generally seems to have made but little progress during the next twenty years, the employment being comparatively limited in extent, and the manufacturers principally confining their attention to the tambour branch of it (with the exception of some light cotton goods for foreign markets), in the almost exclusive production of trimmings, collars, robes, and baby linen.

One of the circumstances which first gave a decided impulse to the manufacture was occasioned by the social revolution wrought among the Scotch and Irish peasantry, and particularly the latter, by the destruction of linen yarn spinning by hand, through the introduction of machinery. Previously the female population were so generally and profitably employed that it was with much difficulty their attention could be directed to "needle-work," as a means of subsistence; but when the manufacture by machinery had nearly destroyed the occupation

of hand-spinning, and the softened hum of the "wheel" ceased to be heard, both the women and girls of the country were left almost without any source of profitable labour, and a very serious change became apparent in the homes of the peasantry.

In these trying circumstances a new field of labour, destined to more than compensate, was opened to them in the manufacture of embroidery; and, though some prejudice existed at first against the employment, the desire soon became universal to have it established. Manufacturers found it their interest to take advantage of the consequent abundance and cheapness of labour to extend their operations; and under their guidance, but frequently aided by individual philanthropy, schools were extensively opened for instructing girls in sewing: so that in a short period in the West of Scotland, and still more extensively in the North of Ireland, the workers increased to many thousands, and the trade became firmly rooted in a vast number of localities where previously it had no existence, the girls then, as now, principally working for Scotch employers.

The cheapness of labour alluded to, and the increasing skill of the workers, enabled the manufacturers to introduce, in lieu of tambouring, the more costly, difficult, and beautiful "satin stitch," and other sewed embroidery; its cheapness and superior elegance not only leading to its being applied to additional articles of ornamental dress, but also to more enlarged use and demand, and to a consequent increase in the trade.

In its internal operations few circumstances were more beneficial to the manufacture, or tended so directly to the improvement of design, as the substitution, about the year 1830, of lithography, for that of the old tedious and expensive system of "block printing." The cost of each block varied from 5s., for the cheapest design, to 5l. for the richest; and the time required for cutting frequently reached three to four weeks; thus subjecting the manufacturer to never-ceasing delay, obliging him to make an inconvenient quantity to cover the expense of each block, and totally preventing cheapness in price, or variety of design.

On the other hand, by the lithographic press, the most elaborate and difficult pattern can be printed in a few hours, at the expense of a few shillings, and with a perfection and ease unattainable by block printing. The facility thus gained of multiplying patterns at such a trifling expense has afforded ample scope to the genius of the designer, the result being eminently promotive of taste, and of the production in the trade of endless variety and novelty of style. Few manufactures in the kingdom have made such rapid progress during the past fifteen years, or have afforded the same amount of valuable employment to the female population, as that of sewed embroidery, it having in that period increased at least threefold.

The amount of employment in Ayrshire, and other places in Scotland, has not probably increased, from the population being less dense, and their being employed in other branches of manufacture; but in Ulster and the West of Ireland the embroidery trade has become almost universal, and is the principal support of the female population.

A recent writer, an eyewitness, having valuable opportunities for obtaining correct information, thus adverts to the subject:—"The progress of the trade was very slow at first, and, for a length of time, was like a speck in the great field of industrial employment; but during the last few years it has grown up, and spread itself north, south, and west, so that it has extended itself over half the counties of Ireland, and is at present giving more or less employment to a quarter of a million of females." He further adds "in the counties of Donegal and Fermanagh, where it was unknown three years ago, there are now civil agents in almost every town, and in remote parts of these two counties advertisements are frequently met with, posted on the trees by the roadside, from agents in the trade, one wanting a thousand workers, and another two thousand girls, whom he offers to teach gratis, if they do not know how to work."

The wages paid for working vary much in amount

depending in some degree on the prosperity or otherwise of the trade. Young and inexperienced workers will probably not receive beyond sixpence per week, the amount gradually increasing to 4s., 5s., and 6s., according to the dexterity of the worker; and a few first-class hands can occasionally earn as much as 10s. per week.

The exact number of manufacturing houses in the trade cannot be at this moment precisely ascertained; but the amount annually turned over in the manufacture is variously estimated at from 750,000*l.* to 1,000,000*l.* sterling, the latter being the most probable sum. On this hypothesis, at least 600,000*l.* (the principal outlay consisting in labour) will be distributed in wages, the workers being invariably employed in their own houses, and in a shape the most beneficial, as they can thus, by their own industry, increase their comforts without endangering their morals.

The market for the industrial productions daily enlarges both at home and in the colonies, where there is ever a ready and secure demand. That of the United States ranks next in importance. A few years ago the Transatlantic export of embroideries was merely nominal; now the United States take at least a quarter of a million's worth annually.

It is also a gratifying fact that, notwithstanding the prevalence of hostile tariffs, the beauty and cheapness of the Scotch and Irish embroideries cause them to find an increasing sale, even in the most exclusive of the continental countries. In France, where by law they are totally inadmissible, they are nevertheless daily introduced, and one particular class finds extensive favour in the fashionable circles of Paris. Also, from various countries of southern Europe, a growing demand is springing up, which, doubtless, in a short period, will become so important as to lead to a further and valuable extension of this branch of industry.

In the Exhibition the home embroidery trade is well, but not more than adequately represented, a great number of parties not having sent any of their productions, however, among those who compete are several who rank first in the trade, and in their hands the reputation of the manufacture is fully sustained.

While the foreign productions, exclusive of curtains, are chiefly confined to cambric handkerchiefs, muslin robes, and fancy articles, such as coverlets, table-covers, armoiral designs, &c., the home manufactures exhibit largely every variety of collars, sleeves, cuffs, caps, robes, baby-linen, and most extensively in flouncings, insertions, and trimmings; also some beautiful toilet-covers and coverlets, the merit of which consists in their decidedly useful character and cheapness.

As regards the future prospects of the trade, they are of a decidedly hopeful character: the manufacture may not in future progress in the same astonishing ratio as hitherto, but there are ample grounds for expecting a further and important extension, based principally on the improvement in design and work which is being effected, as well as on the superabundance of cheap labour. A great amount of this labour is in process of training, and will continue to be absorbed so long as the employment is remunerative, producing in its turn competition, the surest guarantee for improvement in the work and consequently extensive sale.

Much has been done already to improve design, the attention of Government and of the trade being strongly directed to its importance. The Government schools, especially, by affording manufacturers and parents generally the opportunity of educating their children in design, are tending largely to foster its growth; a circumstance which, sooner or later, will lead to the advancement of all fancy manufactures, and to none more so than that of sewed muslin embroidery.

In conclusion, with a trained and industrious population, such as largely exists in the north of Ireland and in Scotland, possessing a decided aptitude for the employment, and willing to labour for a moderate remuneration—the manufacture conducted on the largest scale, with all the advantages of capital, a home market, extended foreign relations, and all the other facilities of commerce—the embroidery trade may reasonably expect

not only to maintain its position, but look forward to an increase and prosperity hitherto unknown.

## FRANCE.

### Lace and Embroidery.

France, proverbially a lace-making and lace-wearing country, has, on this occasion, maintained its high position by contributing some of the most exquisite work, principally hand-made, that has perhaps ever been exhibited, combining perfection of design with surpassing elegance.

In proof of this, it is only necessary to refer to the articles exhibited by Messrs. VINCOG and SIMON, and AUGUSTE LAFRÈRE, both of Paris.

The amount of business done, and the number of hands employed in the manufacture of lace and embroidery, are proofs of their high estimation in all countries.

### Bobbin-net and Lace by Machinery.

The principal towns noted for the production of bobbin-net and lace by machinery in France, are Cambrai, Lille, St. Quentin, Lyons, and, above all, Calais and its suburbs, where there are more than 600 machines in active operation.

The manufacture of this article was introduced into France by English workmen, who, coming from Nottingham, established themselves at Calais, in 1817 and 1819, bringing with them a machine upon the "straight-bolt" principle. This branch of industry has continued to increase and prosper, having always followed the progress and inventions introduced at Nottingham.

Until the year 1845, the articles fabricated in France were only such as were known in the English market; but since that period this branch has been considerably improved by the application of the Jacquard system to the bobbin-net machine, more especially to that called "Leavers," and in consequence its production of articles of novelty has greatly increased.

The following articles are manufactured in a superior style, principally at Calais and at St. Pierre-les-Calais:—

1st. The Neuville ground, with coarse thread, on Leaver's machine.

2nd. The Malines. In order to imitate the lace of this name, made on the pillow, it is purled, and the pattern embroidered by hand.

3rd. The fine plat, made from 14 or 16 point machines, in imitation of the pillow-lace, called Valenciennes.

4th. The coarse plat made from 10 or 11 point machines.

At Lyons, a great quantity of silk net and black lace is made in imitation of pillow-lace.

At Cambrai, also, is produced, with great skill, black lace in lengths, and in piece, for berthes, scarfs, &c.

These articles are made on the circular machine, and are admirable imitations of the beautiful black lace of Caen and Chantilly, the patterns of which are most correctly copied, while the difference in price is 75 per cent. This manufactory is in full work, and has been steadily improving for the last three or four years.

### Embroidery.

Embroidery work of every description is of very ancient date in France: it gives employment to from 150,000 to 180,000 females, spread over more than twenty departments. 8*cl.* to 1*s.* a-day, is earned in the country, and double that sum in Paris.

This branch of industry is subdivided into several parts, which may be placed under two separate heads.

1. Embroidery in colours and fancy work.
2. White embroidery.

Fancy work embraces an infinite variety of forms, and is done in all colours, in all shapes, and on every kind of material.

The two chief seats of this manufacture are Lyons and Paris. It is in the latter place particularly where that great variety of tasteful articles of every description, that occupies so large a portion of its industrious population, is fabricated; for example, embroidery in cotton, wool, silk, straw, gold and silver, thread, beads, &c. &c.

and it is from the workshops of Paris that those magnificent fabrics are sent forth, from rich robes, shawls, and scarfs, to the smallest fancy article, such as purses, bags, Greek caps, cigar-cases, &c.

If the embroidery in fancy articles is so considerable, much greater is that of white embroidery; in fact, this work is carried on in many different ways, by hand, in a frame, with needle, or crochet, with passeé or plume, &c. &c. White embroidery is always done upon lace, muslin, or fine cambric.

Embroidery for furniture is principally done in crochet.

The chief seat of this branch of manufacture is Tarrare, where lace and muslin for curtains and window blinds are worked; as also mousseline-de-laine for ladies' dresses, mantles, and pelerines, which is likewise in crochet.

At Lunéville the work is principally done on tulle with the needle, and consists generally of scarfs, dresses, collars, pelerines, and other articles of taste and novelty. But the very fine embroidery in satin-stitch, for articles of luxury, is the most important part of this branch.

The seat of this beautiful manufacture was formerly Nancy; but for some years past it has extended to the departments of La Meurthe, La Moselle, La Meuse, and des Vosges (forming the ancient province of Lorraine). In these departments they formerly worked on the hand only; but, for the last four or five years, frame embroidery has been more esteemed as giving greater neatness and perfection to the work, particularly in the extra fine. Special attention is now given to the instruction of the new hands in the use of the frame only.

It is in the department of the Vosges that this work has been attended with the most complete success. The women of this department have great aptitude for the employment, and their number is daily augmenting. The characteristic of the Frenchwoman is the remarkable taste she displays in her work. In this delicate and beautiful branch of art, chasteness and elegance of design effect much, but still the embroiderer must blend with these, taste and intelligence. The French workwomen excel in open work, which gives so light and graceful an effect to the various rich patterns so eagerly sought for, and so difficult to obtain. This excellence is attained principally through their being accustomed to the manufacture of white lace by bobbin or needle, generally known throughout France, and which offers so many beautiful patterns for imitation. Every embroiderer pursues her work at home with her family, leaving off when household affairs require her attention, and taking it up again when she pleases. This system has introduced much comfort and ease where it exists.

#### Hand-made Lace.

The manufacture of lace by hand in France gives employment to upwards of 200,000 females, from six to seven years to a very advanced age; each individual earning, upon an average, for a day's work of 10 hours, from 6d. to 1s., sometimes more, according to her skill, or the demand there is for the article.

All French lace is made with bobbins, upon a small portable pillow or cushion, except at Alençon, where the needles are employed and working on parchment.

This branch of industry has latterly increased to an immense extent, and nothing can be more admirable than the beauty of the patterns, combined with the purity of the work and delicacy of the web.

Hand-spun linen thread, cotton, wool, silk, and often gold and silver thread, mixed with the silk, are employed. The great expense in this manufacture is the labour, for in the east of France, setting up work, and the purchase of material does not exceed, upon an average, 12 to 18 per cent. of the whole.

About twenty years ago, all the white lace was made with linen thread, spun by hand (called Malguinerie thread); at present, however, it is rare to find any other used than cotton thread, Nos. 120 to 220.

White and black blonde and black lace are manufactured in the same manner as white lace, there being no difference in the work; the material alone being changed. Formerly white lace only was made, at present blonde and black silk employ half the workers.

This branch is spread over a great part of France, extending from north to south-east, through fifteen departments. Each district has a peculiar style, and what is very remarkable, that, although made in the same way, with the same material, they are instantly recognised; hence the different appellations by which they are known, are derived from the seats of their manufacture. The following are the principal places where this manufacture is carried on in France:—

1. Caen and Bayeux.
2. Chantilly and neighbourhood.
3. Lille.
4. Arras.
5. Mirécourt.
6. Du Pay.
7. Boilleul.
8. Alençon.

For an explanation of the productions of the above-mentioned establishments, a short notice of each is here given.

1. *Caen and Bayeux* (Calvados). The manufacture of lace in these places is much the same, and is the most extensive in silk lace, in length and pieces, employing from 35,000 to 40,000 women. The manufacture of silk lace, at Caen, and particularly at Bayeux, was formerly very little known; now, however, it is different, and scarcely any other tissue is made.

The first silk *blonde* was made at Caen, and called *blonde*, being made of undyed silk of a nankin colour; now they only use silk of the finest white, or of the finest black, with the exception of a few coloured blondes.

The blonde manufacture had rapidly risen to great perfection, and Caen stood unrivalled in her prosperity; but fashion or caprice changed the face of things, the demand for the article became every day diminished, and the majority of the workers are now employed on black lace. Caen and Bayeux excel all other places in the production of what are called piece goods, such as veils, scarfs, berthes, mantles, ladies' robes, shawls, &c. &c., and are considered of these goods the most extensive manufactures in the world. The women of the department of Calvados are remarkably quick at this work, and by means of a stitch called *racas*, which is used in joining several parts in one entire piece, so that the same is imperceptible to the eye even with a glass, they are able to perform in less than a month, with nine or ten persons, what formerly occupied a workwoman one whole year. The manufactures have attained a high reputation, on account of the skill of the workpeople in silk and thread lace.

2. *Chantilly*.—Though this is a name given to a particular lace, being the place of its birth, its fabrication has been principally removed to the neighbouring districts. This lace completely resembles that of Bayeux, except that it has been brought to much greater perfection in the production of finer and richer articles; the prices, consequently, range higher. Fewer hands are employed than at Bayeux, but the improvements of the latter have been regularly adopted. The articles manufactured are less intended for general use, than to satisfy the desires of the luxurious, being laces of the very finest textures and most beautiful patterns.

3. *Lille*.—This manufactory is the oldest in France; it is small, and has not, for a length of time, increased; on the contrary, the only article produced here is white thread-lace, very light and simple, called *clair fondation* (fond clair). Of all singular productions, these are the finest, the lightest, the most transparent, and best made, and, consequently, in higher esteem than any other. This manufacture is of little importance, being on the decline. The workwomen of Lille derive more lucrative remuneration from other industrial resources in that town.

4. *Arras, Pas-de-Calais*.—This manufactory is in the same condition as that of Lille. The lace of this place is, however, esteemed for its low price, but the designs require to be improved.

5. *Mirécourt, Vosges*.—Contrary to that of Arras, this manufacture is constantly introducing new designs. Nearly all the improvements and novelties in lace-making

proceed from Mirecourt, which is renowned for the good taste and elegance of its productions. The same kind of lace is made here as at Lille and Arras, that is to say, clear foundation, and "*fonds de chaîne*," in white thread-lace.

They also produce here a lace, very much resembling the Honiton, called "*guipure*." Within the last four or five years flowers have been made and sewn upon that extremely fine net termed "*Brussels net*." This fabric has, in two years, been so much improved that it now bears a close affinity to the Belgian, at Binche and at Brussels, and is greatly esteemed for its admirable whiteness, its fine quality, and moderate price.

6. *Puy, Haute-Loire*.—This town employs the greatest number of workpeople in France, from 40,000 to 50,000 being spread through the neighbouring departments. The lace made here is coarse, and not rich in texture, but of low price. At Puy all kinds of lace are also made in silk, thread, and wool, as well as point, clear point, point de Chacey, and point de Valenciennes. This town also produces black and white lace, blonde, and other articles of every colour, and especially worsted lace, in pieces, shawls, scarfs, &c. This manufacture promises much for the future, being situated in a province where there are few other industrial resources, and where labour is consequently cheap. The workwomen of Puy and its environs are very skilful, and yet, up to the present time, they have only succeeded in ordinary articles, for which there is no competition.

7. *Haillet*.—This is the only important town in France for Valenciennes: it produces lace of the same kind as that of Bruges (Belgium), but rather coarser. The lace of Haillet possesses two valuable qualities, being the whitest and the cheapest. This lace, though somewhat thick, is very good.

8. *Alençon, Orne*.—The lace of Alençon is the only fabric of this description not made on the pillow, being worked entirely with the needle. It was introduced into France in 1660 by Colbert, who sent to Venice and Genoa for workmen, and they introduced the *point de Venise*, which was at first named *point de France*, and afterwards *point d'Alençon*, from the name of the town where it was made. This lace, however, does not resemble in any manner the *point de l'enise*, as it forms an exception to the others; for, while in the other fabrics one single worker is required to make the richest piece, the Alençon requires from fourteen to sixteen different workers, for the smallest size, even one-quarter of a yard, and the most simple pattern. It is the only lace made with pure linen thread (handspun). This thread is worth from 100*l.* to 120*l.* per pound.

All the workwomen here are extremely skilful. The open work in the lace is made in a superior style, and every day new is made of great perfection. It is the richest, the finest, and the strongest, and consequently the prices are the highest. There are in France several other manufactures of lace, but the foregoing detail will be a *résumé* of all.

This branch of industry, one of the most important, is very interesting, particularly as regards commercial relations, and in a moral point of view.

All the females employed in making lace carry on their work in their own houses, under the surveillance of their parents or friends, who act as their instructors.

#### SWITZERLAND.

Switzerland has largely availed herself of the benefits held out by this Exhibition, and well sustained her long-enjoyed celebrity for both lace and muslin embroidery of every description. It will be seen by the numerous articles shown (displaying at once cultivated taste and excellence of work, combined with cheapness and utility), that her motto is progression, and, as stated by one of themselves, "Under the beneficial effects of free trade the Swiss sewed-muslin trade has made enormous progress." From the variety of articles manufactured, the excellence of the work, and the beauty of the design, the manufacturers send their productions to all parts of the globe, and find ready sale, even where they are met by hostile tariffs. The hands available for needlework in

Switzerland are no longer sufficient to satisfy the demand, and the Swiss manufacturers are employing large numbers in the eastern provinces of Austria, and the southern provinces of the Duchy of Baden.

It would be difficult to state the exact numbers employed in this branch of manufacture, the hands not being in factories or large rooms, as frequently the case in this country—the pattern being stamped or printed on the muslin or net, and given out to workers at their own homes, so that many do their household work, and fill up their time with this embroidery; there cannot, however, be less than 40,000 earning their living by this branch of industry.

A good steady hand can earn, in ordinary times, 1*s.* per day; second-class hands, down to children, range from 3*d.* to 8*d.* per day. The needlewomen of Appenzell (Rhodes intérieures) are noted as the most skilful workers in sewed muslin, &c.; hence the finest and most difficult work is done there, and the highest wages are received.

Those articles in which cheapness is the recommendation, are done by the needlewomen of St. Gall, Vorarlburg, and Baden. It is estimated that 100,000 pairs of curtains alone are annually imported into the United Kingdom of Great Britain, at prices varying from 3*s.* to 100*s.* per pair, paying a duty of 15 per cent.

The Swiss manufacturers do not regard England as their best customer; they export largely to America (North and South), Germany, Italy, Spain, and other southern countries. The trade is steadily progressing, and is principally conducted by the manufacturers of the canton of Appenzell, a few only residing at St. Gall, where they have a Wednesday's and Saturday's market for the transaction of business.

The continued care for new styles, novel designs, and cheaper productions, has evidently had the effect of developing the skill and artistic faculties of the Swiss manufacturers, as may be seen by the unrivalled excellence of some of the goods in the Exhibition.

The productions of Mr. J. J. SUTTER and Mr. J. U. TANNER, both of Bihler, are here more particularly referred to, as being of unrivalled excellence.

#### SAXONY.

Saxony has furnished a small assortment of lace and embroidery, mostly of a manufacture peculiar to the country, being heavy, firm, and well made, but of limited sale in the English market.

#### SPAIN.

The exhibition of lace and embroidery is limited, although there are some articles deserving of notice, from their richness and antiquity.

#### HAMBURG.

There is little from this place, except some specimens of embroidery with hair, displaying much taste.

#### AUSTRIA.

We cannot say much of the articles exhibited in lace and embroidery, as they are very few, and of a class that would not suit the British market.

#### MALTA.

There is little worthy of notice from Malta.

#### LACES OF BELGIUM.

The description of lace peculiar to this country is admirably sustained by some of the exhibitors in this department, there being a valuable display of Valenciennes edgings and laces of Mechlin, and other goods of the most costly and superb character, representing some thousands of pounds in value, evincing at once the taste and perseverance of the Belgian manufacturers, who are finding employment for at least a hundred thousand hands annually, by the production of this description of lace, used principally by the middle and upper classes of society.

Belgium still retains the pre-eminence it has long enjoyed, for the perfection displayed in the manufacture

of the most beautiful laces; in proof of which the articles exhibited by Messrs. DUHAYON-BRUNFAUT and Co., of Brussels and Ypres, may be more particularly referred to, as also those of other exhibitors. The laces chiefly manufactured are termed Brussels, Mechlin, Valenciennes, and Grammont laces.

I. "Brussels" produces two different descriptions of lace, known as "Point à l'aiguille," and "Brussels plait."

The former is made entirely with the needle, the latter is made on the pillow, and "Honiton lace" very much resembles it.

The finest and most expensive kind is made of very fine flax thread, and some of cotton. Formerly the laces were made only on the "real ground," which is made on the pillow in narrow widths of from 1 to 3 inches, and then joined with such admirable ingenuity as to be imperceptible.

It is of the most beautiful description, being remarkably soft and clear, but so costly as to be within the reach of comparatively few persons. Hence it was only worn at Court, and by the most wealthy.

Trimming lace of 4 inches wide varied in price from four to ten guineas per yard: veils, from twenty-five to one hundred guineas each, and other articles were proportionately expensive; but recently, owing to the great improvement which has been effected by eminent houses in the town of Nottingham (England), in producing a very superior net by machinery, the lace is now manufactured at a much less cost; the flowers or designs being made by hand, and afterwards sewed on to the "machine-made" net. This description of lace is known by the term "application of Brussels," and its resemblance to the Brussels point lace is so striking as frequently to deceive those who possess a good knowledge of lace.

"Brussels plait" is in considerable use in France, Spain, Russia, and other countries, and is made of most exquisite quality.

The "Point à l'aiguille" is more worn in England; and since the great improvements which have been made in producing this beautiful lace at so considerable a reduction in price, the demand for it has become very general, and it is now worn by nearly all ladies of rank and fashion.

In the manufacture of Brussels lace several classes of workers are employed, as follows:—1. Those who make the flowers in plait. 2. In point. 3. The real ground. 4. The ground in the flowers. 5. The attacheuses (fasteners). 6. Those who apply on the net. 7. Those who work the point, and the new kind of real Brussels, &c. (the "gaze point").

With the exception of the point d'Alençon (made in the north of France), Brussels produces the most valuable lace that is known.

II. Mechlin laces are made at Malines, Antwerp, and in the vicinity, and are of the lightest and most beautiful texture. They are all made in one piece on the pillow, and their peculiarity consists in a plait thread surrounding the flowers, and designing the outline, so as to give the appearance of embroidery. This manufacture has suffered very much from the caprice of fashion.

III. Valenciennes laces are made chiefly in the following towns, and the surrounding villages, viz., Ypres, Menin, Courtrai, Bruges, Ghent, and Alost.

Although all made in the same manner on the pillow, yet the productions of the various towns named are so characteristic, that a person accustomed to examine them, will readily distinguish where each piece of lace was made.

1. Ypres excels particularly in laces of the finest square grounds, of the widest and most expensive description, varying in price from 6d. to 50l. the English yard. This branch of industry was commenced at Ypres about 1456; and according to a census made by Louis XIV. in 1684, there was then one lace manufacturer, and 63 workers employed. It is only since 1835, that its trade has been so considerably developed; and how it is estimated that the lace-makers of Ypres purchase the produce of about 20,000 workers living in the town and its environs.

The bulk of the lace manufactured here is exported, principally to England, France, and Germany, and a trade

has been opened with the United States; but a great barrier to its increasing development exists in the greatly-varying duties levied upon lace by different countries.

2. Menin provides employment for about 2,000 or 3,000 workers.

3. Bruges. The manufacture in this town has immensely increased, and a considerable trade is now carried on. The laces here are of a good, useful quality, suitable for trimmings, and are much sought after by English buyers; but the number of persons engaged here in the making of lace is not so large as in Ypres.

4. Ghent. The fabric of this place is extremely good, and laces of all qualities are produced, principally consisting of the narrow and medium widths, employing in their manufacture about 10,000 or 12,000 persons.

5. Alost possesses very excellent workers; but the designs are not equal to those of Ypres, and the colour of the laces is inferior.

IV. In the village of Grammont great improvements have been made in white-thread lace, also in black point trimming laces.

Recently, the manufacture of piece-goods, as shawls, scarfs, berthes, &c., has been commenced, and is carried on with great success. The quality and designs are not equal to those of France, but the prices are much lower, and these productions are now in considerable demand.

#### BRITISH LACE.

A Council Medal has been awarded to BALL, DUNN-CLIFFE, and Co., Nottingham (19, p. 560), for velvet and Simla lace; being new patented fabrics, suitable for shawls, dresses, and for various ornamental and useful purposes, and of commercial importance. Also imitation Valenciennes, and white and black point tulle, of great merit.

The Jury award prize Medals to the following:—

AYERS, W., Newport Pagnell, Bucks (388, p. 573), for specimens of wide thread-lace of good useful quality.

CLARKE, ESTHER, London (130, p. 565), for a Honiton lace flounce, of which the design and quality are unequalled in its class.

FISHERS and ROBINSON, Nottingham (2, p. 559), for imitation of Valenciennes laces, black trimming laces, and patent spot-nets, all possessing merit as machine-finished goods; also two tamboured net shawls, with a variety of excellent black Jacquard laces and shawls of superior merit.

FORREST, JAMES and SONS, Dublin (45, p. 561), for jacket-flouncings, scarf, berthe, and handkerchief, in imitation of old Spanish point, with specimens of Limerick lace. The whole unequalled in their class.

GREASLEY and HOPCROFT, Nottingham (34, p. 561), for very superior Jacquard shawl; also flouncings and falls, together with some needlework-shawls well executed, and truthful imitations of real lace.

GROUCCOCK, COPESTAKE, MOORE and Co., London (3, p. 559-60), for Honiton guipure half-shawl, flouncings, lap-pet, and trimming-lace, of excellent design and manufacture. Double-flounced dress, with court train; tamboured on fine Brussels net, elaborately worked and well designed. Very wide Buckinghamshire lace of fine quality. Embroidered muslin low and high chemisettes, collars, cuffs, trimmings, &c., of superior work.

HEALD, B., Nottingham (269, p. 570), designer, for pattern for broad lace flounce, evincing good taste and suitability of design.

HEYMANN and ALEXANDER, Nottingham (25, p. 560), for machine-made lace curtains in great variety; also, plain and fancy nets, remarkable for cheapness and utility.

HOWELL, JAMES, and Co., London (5, p. 560), for guipure Honiton lace shawl and mantle of very excellent manufacture.

LAMBERT and BURY, London (4, p. 560), for Limerick lace shawl and tunic dress.

LITZKE, T., Bedford (236, p. 568), for wide white and black lace.

MALLETT and BARTON, Nottingham (29, p. 561), for imitation black trimming-laces, and Valenciennes edgings.  
 RECKLESS and HICKLING, Nottingham (32, p. 561), for shawls, scarfs, flouncies, falls, and trimming-laces, in imitation of black point lace. Also for white tamboured shawls, scarfs, flouncies, and falls. The whole possessing great merit in design, as well as in execution.

RIEGO DE LA BRANCHARDIERE, E., London (17, p. 560), for basket of flowers, rock, berthe, &c., in crochet-work; very beautiful.

ROBINSON, THOMAS, Nottingham (25a, p. 560), for machine-made lace curtain of excellent quality and graceful design, exhibited by Heyman and Alexander.

ROSE, JONAS, Coggeshall, Essex (282, p. 570), for double flounce, scarf, and berthe; the design superior, and the work unequalled in its Class.

STREGMANN, H., and Co., Nottingham (41, p. 561), for machine-made lace curtains of great beauty of design and general excellence.

THREADWIN, C. E., Exeter (55, p. 561), for Honiton guipure flounce, resembling ancient lace; the pattern, from Government School of Design, is particularly commended.

VICARS, R., Padbury, Buckingham (235, p. 568), for wide thread-lace of fine quality.

VICKERS, WILLIAM, Nottingham (33, p. 561), for shawls, scarfs, mantles, falls, flouncies, and trimming-laces, of great merit in design, and for their faithful imitation of real black point lace, and at comparatively moderate prices.

WEDDON, FRANCIS, London (6, p. 560), for British point lace shawls, lappets, and specimens of flouncings; designs very good.

WHITLOCK and BILLIARD, Nottingham (27, p. 560), for imitation laces; an admirable copy of the real Mechlin.

The Jury make Honourable Mention of the following Exhibitors in this department:—

ADAMS and SONS, Nottingham (21, p. 560), for thread edgings, made on the traverse warp machine, being neat and useful goods.

CARDWELL, C. and T., Northampton (122, p. 560), for pillow-lace of different widths.

CLARKE, JANE, Regent Street, London (18, p. 560), for specimens of lace, copies of old Spanish point; the work extremely fine and beautiful.

GILL, W. L., Colyton, Devonshire (386, p. 573), for specimens of Honiton lace, in imitation of Spanish and Venice point.

HEALD, HENRY (295, p. 570), student of Government School of Design, Nottingham, for pattern of half shawl in good taste.

HERBERT, THOMAS, and Co., Nottingham (28, p. 560), for imitation blondes, laces, crochet-edgings, &c.

IRISH WORK SOCIETY, London (77, p. 563), for various descriptions of lace, knitted, netted, and crochet; also, various specimens of hosiery.

KIGHTLEY, I. (123, p. 564), for pillow-lace, narrow and wide.

LADIES' INDUSTRIAL SOCIETY, Dublin (213, p. 567-8), for infants' lace-robes, imitation of Spanish point; also shawl, mitta, parasol, &c., made from the fibre of sweet pea, nettle, and honeysuckles, an application of a new material to textile purposes.

LAUGHER and COHEN, London (10, p. 560), for Honiton half-shawl of good quality.

SIM, C. J., Bedford (301, p. 571), for two pair of lappets made on the pillow, an excellent imitation of Mechlin lace; also various trimming-laces.

TENTON, SAMUEL (179), designer, Nottingham, for a design for lace curtains.

#### SCOTCH AND IRISH EMBROIDERY.

The Jury award Prize Medals to the following subjects:—

BARR, J., and Co., 189 Regent Street, London (34, Class XX., p. 578), for embroidered shirt-fronts, tasteful in design and of fine work.

BROWN, SHARPS, and Co., Paisley, and 18 Watling Street, London (57, p. 562), for embroidered muslin robe, of great richness of effect and splendour of design.

BROWN, S. R. and T., Glasgow (58, p. 562), for rich book-robe, short cambric frock, cambric handkerchiefs, stomachers, and collars, with other articles of great beauty, utility, and excellence; also, a number of book-muslin collars exhibited for lowness of price.

HOLDEN, J., and Co., Belfast, Ireland (1, Class XIV., p. 510), for muslin insertions and trimmings, embroidered robes, and frock bodies; also, some fine embroidery in robes and jacobot, remarkable for cheapness and effect.

MAIR, J., Son, and Co., 60 Friday Street, London (59, Class XI., p. 482), for three muslin robes (sewed and tamboured), very chaste in design and of excellent work.

MACDONALD, D. and J., and Co., Glasgow (66, p. 562), for embroidered muslin robe, cap, and bassinet; designs very graceful, and work exquisite, being the finest sample of sewed-work in English, Scotch, or Irish embroidery. This firm also exhibit medium and wide open-work flouncings, fine broad trimmings, embroidered muslin robe, high chemisettes, and many other articles of merit in design, execution, and utility.

SALOMONS and SONS, 42 Old Change, London (305, Classes XII. and XV., p. 501), for embroidered guipure cambric cape and handkerchief, high chemisette, and collar, work of much excellence, and great novelty in the introduction of a new guipure stitch.

The Jury make Honourable Mention of the following Exhibitors in this department:—

BROWN, HUGH, Glasgow (64, p. 562), for muslin flounce and trimmings, embroidered robes, and cambric handkerchiefs.

BROWN, J. R. and W., Bangor (2, Class XIV., p. 510), for embroidered muslin robe, of good work.

CAPPER and WATERS, London (21, Class XX., p. 578), for court suit in work, lace frill and cuffs in imitation of point lace.

ROBERTSON and SONS, Glasgow (62, p. 562), for cambric table-cover, collars, and other useful embroidery.

#### BRITISH TRIMMINGS AND FRINGES.

The Jury award Prize Medals to the following subjects:—

BENNOCH, TWENTYMANN, and RIGG, 77 Wood Street, Cheapside, London (394, p. 574), for a variety of gimps, fringes, and cameo braids, showing general excellence.

DANBY, C. and T., 14 Coventry Street, London (71, p. 562), for a variety of silk fringes, garniture for dresses, cord and tassels, and other trimmings of taste and novelty.

EVANS, R. and Co., 24 Watling Street, London, (74, p. 563), for silk fringes, braids, and fancy buttons.

HAMBURGER, ROGERS, and Co., 30 King Street, Covent Garden, London (186, p. 566), for epaulettes, military hats, and embroidery suitable for regimentals, of good design and execution.

LAMBERT, BROWN, and PATRICK, 236 Regent Street, London (83, p. 565), for epaulettes and laces, embroidered waistcoats, masonic emblems, church decorations, facsimile of Bible used by King Charles I. embroidered in gold, and coloured silks; all of great merit.

#### UPHOLSTERY FRINGES, TRIMMINGS, AND COACH LACES.

• The Jury award Prize Medals to—

BURGH, ROBERT, 49 Bartholomew Close, London (75, p. 563), for specimens of gimps, tassels, and ornaments, in fine taste, and well executed.

JULLIEN, JEN., Tours (Indre and Loire), (1290, France, p. 1298), for specimens of gimps, fringes, tassels, ornaments and glass frames, formed of silk rope, very tastefully and well executed.

LEES, R. and Co., 36 King Street, Cheapside, London (79, p. 563), for printed mohair velvet, of very handsome design and well executed.

SCHARFF, R., Brieg (118, Prussia, p. 1055), for a large assortment of coach laces and trimmings, possessing a high degree of excellence in design and execution.

The Jury make Honourable Mention of the following Exhibitors:—

BELES, SOPHIA A., Ireland (159, p. 566), for specimens of tatting in collars, berthes, chemisettes, &c., of very fine quality.

GUILLOT BROTHERS (251, France, p. 1188), for coach and livery laces.

HARRISON, T., London (85, p. 563), for altar-cloth and cushions of crimson Genoa velvet, embroidered in gold.

KINGSBURY, LOUISA, Taunton (225, p. 568), for a basket of flowers, &c.

ONTON, E., Birmingham (56, p. 562), for an assortment of good fringe, tassels and ornaments.

PUZIN, Beaumont Depot (1414, France, 1244), for lace and trimmings for carriages, and livery laces, extremely good.

STANDRING and BROTHER, Manchester (239, Class XXIX., p. 802), for a good assortment of braids, laces, plaited lines, binding plain and figured, and fringes for dresses.

WESTHEAD and Co., Manchester (275, Class XXIX., p. 816), for a good assortment of tapes, and binding of various kinds, lines, &c.

ZIEBIG, H., Breslau (225, Prussia, 1060), for specimens of upholstery and coach trimmings of good workmanship.

#### FRANCE.—LACE AND EMBROIDERY.

The Jury award Prize Medals to the following:—

AUBRY BROTHERS, 33 Rue des Jeuneurs, Paris (1544, France, p. 1250), for laces from Mirecourt, made in the same manner as Brussels plait; double skirt-dress, half shawl, coiffure, lappets, also trimming lace, &c. Designs and work meritorious.

BEER and Co., 17 Rue de Cléry, Paris (54, France, 1174), for robe, shawl, scarf, veil, berthe, cape, &c., in imitation of Brussels lace, being superior to any others exhibited of their class.

DARNET, Rue Richelieu, Paris (1578, France, p. 1252), for a great variety of shirt fronts, beautiful in designs, and of good embroidery.

DEBIELD-PELLERIN, and Co., 73 Rue Richelieu, Paris (1173, France, p. 1234), for a magnificent counterpane (worked at Nancy). Beauty of design, excellence of work, and general effect.

DELA ROCHE-DAIGREMONT, 17 Rue de la Paix, Paris (267, France, p. 1189), for muslin robe, jacket, and a variety of cambric handkerchiefs and collars, all of much merit.

FOULQUÉ, Mlle., and Co., 20 Rue Hauteville, Paris (1603, France, p. 1253), for collars, half shawls, neckerchiefs, and other articles of knitting work, possessing merit as regards novelty and cheapness.

HEYLER, Mlle. MARIE, 36 Rue de l'Ecliquier, Paris (539, France, p. 1204), for silk-net mittens and gloves of very superior quality.

HUBERT, Madame JOSEPHINE, Mondeville, and 2 Rue du Grand Chantier, Paris (268, France, p. 1189), for head-dresses, and garnitures for robes, in needle-point relieve. Designs of high artistic excellence, and much novelty and ingenuity exhibited in their application for the purposes named.

LEFEBVRE, AUGUSTE, Bayeux, and 42 Rue de Cléry, Paris (1646, France, p. 1256), for white thread-lace counterpane, black lace half-shawl and scarf; Alençon point lappets and scarf, and white blonde mantilla. The white lace counterpane is a very beautiful production, and deserving the highest encomiums for fineness of quality, beauty, and elaboration of design.

LEMAIRE and SON, 1 Rue des Poillantes, Lyons (1649, France, p. 1256), for embroidery in gold, and the application of gold and silver to this purpose, evincing superior skill. (Prize Medal awarded by Jury of Class XIII.)

MALLET BROTHERS, Calais (599, France, p. 1256), for specimens of machine-made imitation Valenciennes lace and lappet. Fine ground and good patterns.

MOSSELIN, T., 139 Rue Montmartre, Paris (641, France, p. 1200), for fancy ribbon trimmings for dresses and cloaks. Designs very tasteful.

MÉRAUX, J. H., 7 Rue de la Jussienne, Paris (631, France, p. 1208), for patterns for rich flounce, handkerchief, lappets, &c., in excellent and appropriate taste.

MORÉAU and Co., 22 Rue d'Enghien, Paris (652, France, p. 1209), for embroidered shirt-fronts, of much merit, both in design and execution.

MOULARD, Mlle., 39 Rue Montmartre, Paris (655, France, p. 1209), for lace head-dress, caps, tobacco-bags, net-purses, with various fancy articles in chain-stitch work.

MORNIÉUX, F., 31 Rue Mendétour, Paris (1362, France, p. 1241), for galloons, and buttons of superior quality, and excellent taste.

PAGNY, Paris (675, France, p. 1211), for black point-lace shawl and scarf. Design and quality deserving high praise.

REPIQUET and SILVENT, Place de la Croix-Paquet, Lyons (1432, France, p. 1244), for a large variety of velvet and silk trimmings in very good taste. (Prize Medal awarded in Class XIII.)

RANDON, L., Caën, and 9 Passage des Petits Pères, Paris (1684, France, p. 1257), for white blonde flounce, scarf, berthe, lappet, and coiffure; also lappet in gold and silver. Decided merit in an effective and beautiful style of design, with great richness of effect.

VAUGEON and TRUCHY, Rue Mauconseil, Paris (718, France, p. 1213), for gold and silver embroidery. The arms of Paris, écharpe, epaulettes, and fringes.

VIDEBOC and SIMON, 35 Rue de Jeuneurs, Paris (1706, France, p. 1258), for Chantilly shawl, scarf, dress, flounce, and suite of Alençon point-lace. The magnificence of design, extraordinary beauty, and surpassing quality of the articles exhibited, merit the highest praise.

#### FRENCH LACE, &c.

The Jury make Honourable Mention of the following Exhibitors in this department:—

AUDIAT, F., Paris (1545, France, p. 1250), for embroidered imitation trimming laces, on Mechlin grounds, of good design and workmanship.

DABARET-TAMPÉ, Oise (152, France, p. 1178), for a great variety of silk buttons.

DELCAMBRE, A., Paris (1584, France, p. 1252), for gold and natural colour silk lace, and black point-lace and scarf.

HOOPE, CARROZ, and TABOURIER, Paris (1625, France, p. 1255), for lace scarf, lappets, and berthe, in imitation lace.

LAROCHE, E., Designer, Paris (291, France, p. 1190), for pattern suitable for guipure lace. (Prize Medal awarded by Jury of Class XXX.)

LAURENT, J. B., Paris (902, France, p. 1223), for silk buttons and other articles of trimming.

MARTIN, C. A., Paris (613, France, p. 1207), for silk buttons, fringes, &c.

MERCIER, Paris (1354, France, p. 1241), for purses, Greek caps, reticules, and various other fancy articles, evincing much taste and novelty.

SEGUIN, JOSEPH, Puy, Haute-Loire, and Paris (1008, France, p. 1227), for new description of black diamond open ground lace in half-shawl, mantle, and laces.

TUISSANT Designer (France, p. 1200), for rich scarf with guipure border, showing novelty in design.

#### SWITZERLAND.—LACE AND EMBROIDERY.

The Jury award Prize Medals to the following:—

ALTHER, J. C., Speicher, near St. Gall (110, Switzerland, p. 1273), for muslin curtains, embroidered in colours, in good taste.

BUNZIGER, J., Thal, near St. Gall (103, Switzerland, p. 1276), for embroidered double-founced dress, of great novelty in design; arms of England embroidered on cambric, with several other articles of merit.

CHRENZELLER, F., St. Gall (121, Switzerland, p. 1278), for net and muslin curtains, very chaste in design, and of superior work.

FISCH BROTHERS, Buehler, Canton of Appenzell (193, Switzerland, p. 1279), for net curtain, decided novelty in design.

SCHLAEPFER, SCHLATTER, and KRUSTEINER, St. Gall (201, Switzerland, p. 1279), for two pairs of net curtains, of excellent design; with a variety of other useful articles.

SCHOCH, SCHIESS, and SON, Herisau, Canton of Appenzell (202, Switzerland, p. 1279), for embroidered handkerchiefs, of good work and rich design.

STAEHEL-WILD, C., St. Gall (203, Switzerland, p. 1279), for two embroidered table-covers, window curtains, waistcoat piece, several handkerchiefs and collars: the whole of beautiful design and superior work.

SUTTER, J. J., Bühler, Canton of Appenzell (203, Switzerland, p. 1279), for chints book robe of great beauty; net curtain, with Swiss scenery, several cambric handkerchiefs, exquisite in design, illustrating various objects in natural history, combined with landscape views and other objects of novelty portrayed in needlework.

TANNER, J. U., Bühler, Canton of Appenzell (205, Switzerland, p. 1279), for embroidered coverlet, figure of William Tell in the storm. Framed piece of needlework, representing a girl embroidering the figure of William Tell; cambric handkerchiefs of great beauty, bouquet of flowers, in silk; with other articles of great merit.

TANNER and KOLLER, Herisau, Canton of Appenzell (206, Switzerland, p. 1279), two embroidered muslin dresses, rich cambric handkerchiefs, with other articles of merit.

The Jury make Honourable Mention of the following exhibitors in this department:—

HOLDREGER, C., St. Gall (195, p. 1279), for embroidered curtain of good design and very effective.

TANNER, B., St. Gall (204, p. 1279), for muslin in the piece, fine and well manufactured.

VONWILLER, ULRIC DE GASP, St. Gall (140, p. 1275), for a variety of low-priced articles, suitable for the foreign market.

#### BELGIUM.—LACE AND EMBROIDERY.

The Jury award Prize Medals to the following:—

BECK and SONS, Courtray (324, Belgium, p. 1161), for broad and narrow Valenciennes of good fabric.

DEFRENNE, SOPHIE (316, Belgium, p. 1161), for Brussels point handkerchief, of much taste and elegance.

DELEHAYE, A. (305, Belgium, p. 1160), for "application of Brussels" flounce. Real Brussels fall and scarf of good execution.

DUMATON-BRUNFAUT, and Co., Brussels and Ypres (314, Belgium, p. 1161), for wide and narrow Valenciennes laces, in great variety. Rich real Brussels half-shawl and handkerchief. The wide Valenciennes laces are of surpassing beauty, and unequalled as to quality and design. The Brussels shawl and handkerchief are most elaborately worked, and possess much merit.

HAROW, J. T. (341, p. 1161), for a real Brussels plait veil.

HAMMELRATH, P. H., Ypres (337, Belgium, p. 1161), for Valenciennes laces in great variety and beauty, both in design and quality. One piece, extremely wide for this description of lace, is deserving of much praise.

HÉUSCHEN VAN ECKHOUT, and Co., Brussels (310, Belgium, p. 1160), for two bobbin Brussels lace dresses, real Brussels fall, guipure handkerchief and cape, &c., excellent designs and quality.

MELLOTTE, E., Brussels (302, Belgium, p. 1160), for magnificent piece of gold embroidery of superior work.

NAELTJENS, G., Brussels (308, Belgium, p. 1160), for bobbin Brussels berthe, coiffure lappet, jacket, falls, and flounces: the whole a good medium class, and as such possessing merit.

POLAK, F., Brussels (398, Belgium, p. 1160), for designs for black lace flouncings, scarfs, trimming laces, &c., in good and appropriate taste.

REALLIER, Mlle., Brussels (309, Belgium, p. 1160), for

Brussels point lace handkerchief, made of flax thread, needle-wrought ground; for beauty, harmony of design, perfect execution, and fineness, this article belongs more to the fine arts than to ordinary manufactures.

SOENEN, F., Ypres (338, Brussels, p. 1161), for Valenciennes lace handkerchief and lappets—excellent goods.

STOQUART BROTHERS, Grammont (307, Belgium, p. 1160), for black point lace shawl, scarf, lappets, flouncings, &c.—much merit, taking prices into consideration.

VANDER-KELEN-BRESSON, Brussels (313, Belgium, p. 1160), for Brussels lace handkerchiefs, artistic design: subject, the Royal Arms of England, Glory, Industry, and Justice. Guipure flouncings and berthe of superior quality; with various other articles of much merit.

VAN HALLE, J., Brussels (303, Belgium, p. 1160), for complete set of rich vestments, consisting of chasuble, cope, and dalmatics. Three figures, representing Bossey Bishop of Meaux; Fénelon, Bishop of Cambrai; and St. Thomas à Becket, clothed in episcopal robes of exquisite embroidery, studded with brilliants. The mitre is adorned with diamonds, rubies, and pearls. The albe is of real Brussels lace.

VAN KIEL SISTERS, Mechlin (333, Belgium, p. 1161), for real Mechlin lace lappets, trimming lace, lace fall, and collar—much merit.

The Jury make Honourable Mention of the following Exhibitors:—

BOUSSON DE VLEGHERE, Bruges (328, Belgium, p. 1161), for two flouncings, imitation of Spanish point lace, of bold and effective style.

DARTEVELLE and MOUNOURY (329, Belgium, p. 1161), for imitation Brussels scarf; Mechlin half shawl, &c.

EVERAERT SISTERS, Brussels (321, Belgium, p. 1161), for black lace shawl, dress jacket, and veils, good in quality and design.

ROY, C. F. (301, Belgium, p. 1160), for "application of Brussels" flounce; very bold and effective.

St. JOSEPH, Establishment of, Verviers (322, Belgium, p. 1161), for Flanders guipure lace flounce, sleeves, and trimming-lace, of excellent quality and good style.

#### SAXONY.—EMBROIDERY.

The Jury award Prize Medals to the following:—

BACH, G. F. and SON, Buchholz (158, Saxony, p. 1111), for fancy gimps and silk fringes; much merit in taste, excellence of execution, and cheapness.

HIETEL, J. A., Dresden (168, Saxony, p. 1112), for seven tableaux embroidered in hair and silk, in imitation of engraving. The whole beautifully executed, particularly the portraits of the King of Saxony and Her Majesty Queen Victoria.

SCHMIDT, G. F., Plauen (60, Saxony, p. 1107), for set of furniture; easy chair, pillow, and cushions, window-cushion, wall-basket, table-cover, shades, letter-case, and pincushion, embroidered on muslin; possessing merit, as showing a new use for embroidery. Designs and work well adapted for the purpose.

SECRETER, F. A., Dresden (71, Saxony, p. 1108), for pillow-lace guipure, berthe, barbe, in imitation of ancient lace, both possessing merit.

The Jury make Honourable Mention of the following Exhibitors:—

BOEHLER, F. L. and SON, Plauen (56, Saxony, p. 1107), for embroidered cambric handkerchiefs.

SCHNORR and STEINHAUSER (62, Saxony, p. 1107), for table-cover of good design and work.

SCHUBERT, Mrs., Annaberg (156, Saxony, p. 1111), for a worked table-cover on net-lace, of rich appearance, and ingenious design.

#### DENMARK.

The Jury award a Prize Medal to—

WULFF, JENS, and SONS, Brede, Schleswig (5, Denmark, p. 1356), for lace collars, cuffs, thread-edgings, and faces; a good useful class of goods.

## TUSCANY.

The Jury award a Prize Medal to—

PASLANI, F., Borgo a Buggiano (102, Tuscany, p. 1398), for a piece of embroidery in imitation of engraving. Subjects embracing the map of Europe, Napoleon at St. Helena, portrait of Rubens, &c.

## SWEDEN AND NORWAY.

The Jury award a Prize Medal to—

HANRÉN, SOPHIE, Halmstad (28, Sweden and Norway, p. 1351), needlework embroidery, representing the Royal Palace of Ulriksdal, near Stockholm; extremely well executed.

## SARDINIA.

The Jury award a Prize Medal to—

STEFANI, W., Turin (86, Sardinia, p. 1305), for two large silk embroidered tableaux of great merit.

## SPAIN.

The Jury award Prize Medals to the following Exhibitors:—

FITER, J., Barcelona (221, Spain, p. 1343), for rich black blonde dress and mantilla, of superb appearance, remarkable for the introduction of coloured flowers, evincing much taste and elegance.

GILART, R., Madrid (237, Spain, p. 1344), for the royal arms of Spain, elaborately worked with coloured silks, having a rich and costly appearance, with the gold and silver on crimson Genoa velvet. The work is beautifully executed, and produces a very brilliant effect. Also some exquisite embroidery on grass-cloth, being the baby-linen made for the late Prince of Asturias.

MARGUERITA, Señora (236, Spain, p. 1344), for rich dress from the fibre of pine-apples, embroidered by hand; very beautiful of its class. Exhibited by W. P. HAMMOND, and Co., London.

The Jury desire to make Honourable Mention of—

G. M. SENORA, Madrid (238, p. 1344), for a fine curiously-embroidered shirt.

## HAMBURG.

The Jury award a Prize Medal to—

COMBERTZ, B. (33, Hamburg, p. 1137), for hair-embroidered pictures of the Queen and the Prince of Wales, and of the Hamburg Exchange.

## AUSTRIA.

The Jury award a Prize Medal to—

BENKOWITS, MARIE, Vienna (389, Austria, p. 1029), for embroidery of crape thread on white silk, representing Beneficence. An embroidery of wool and silk, representing the Grave of the Fallen Soldier.

The Jury make Honourable Mention of—

BAUMOFER, F., Vienna (388, Austria, p. 1029), for the arms of England embroidered with gold and silver, well executed.

KARICKI, E., Vienna (263, Austria, p. 1019), for a piece of embroidery, the arms of England in gold, silver, and silk, well executed.

## RUSSIA.

The Jury make Honourable Mention of the following Exhibitors:—

SHEKHONIN, ALEXIS, of Novgorod (375, Russia); Prize Medal, Class XX., p. 1375).

POPINOFF, SOPHIA, of Tiflis (310, Russia); Prize Medal, Class XX., p. 1376).

NAKHICHEVAN, Town of (374, Russia, p. 1375). All for a number of articles in leather embroidered with it, adapted for caps, slippers, boots, &c., with many of articles possessing beauty and excellence.

## SARDINIA.

The Jury make Honourable Mention of—

TESSADA, F., Genoa (49, p. 1304), for several embroidered cambric handkerchiefs.

## GREECE.

The Jury make Honourable Mention of SAKIS and RENGOS, Athens (56, p. 1406), for embroidery in gold.

## NEEDLEWORK AND EMBROIDERY.

The Jury award the Prize Medal to the following Exhibitors:—

FAUDEL and PHILLIPS, London (165, p. 566), for embroidered hangings for a state bed, showing various kinds of embroidery in the curtain drapery, tester, and coverlet. The panel in the foot-board is a copy of the "Aurora" by Guido, very finely executed, from a drawing: for the centre of the head-cloth, a medallion finely worked from a cast, being a successful copy of Thorwaldsen's "Night."

HOULDSWORTH, JAMES, and Co., Manchester (64, Class XIII., p. 506), for embroidery by machinery on cloth and silk.

SEEL, G. (Prussia, 657, p. 1086), for ornamental articles, and pictures in hair, most artistically executed.

The Jury make Honourable Mention of the following:—

GRÜNTAL, Berlin (166, Prussia, p. 1057), for Berlin patterns for needlework.

HARTREE, E. and G., London (195, p. 567), for a table-cover embroidered on new silk canvas, the invention of the Exhibitor; also three small pictures in tent-stitch, finely executed.

HELBRONNER, R., London (199, p. 567), for specimens of a new style of needlework, of good design, and well executed.

JACKSON, C., London (84, p. 563), for *appliqué* embroidery, forming the top of a table; well worked, and in good taste.

JANCOWSKI, W., York (48, p. 561), for a small picture embroidered in tent-stitch, extremely well done.

MEE, CORNELIA, Bath (51, p. 561), for banner screen, flags of all nations, well arranged and executed; embroidery suitable for borders to curtains or portières, the flowers well arranged and well coloured.

NEBE, F. W., Berlin (Prussia, 168, p. 1057), for Berlin pattern for needlework.

PARVE, C. F. W., Berlin (169, Prussia, p. 1057), for a needlework carpet, of good design, and well executed.

PURCELL, FRANCES, London (88, p. 563), for an embroidered table-cover, tastefully designed and coloured, and exhibiting different kinds of needlework.

SCHLEUSS, H., Berlin (160, Prussia, p. 1057), for specimens of embroidery.

SOMMERFELD, B., Berlin (173, Prussia, p. 1057), for an assortment of needlework and embroidered articles.

TODT, A., Berlin (171, Prussia, p. 1057), for Berlin patterns for needlework.

## CARPETS.

In reviewing the existing state of the manufacture of carpets, the first specimens that claim our attention are those from India, Persia, Turkey, and Tunis.

However great may be the differences in quality amongst the carpets from the countries mentioned, they are all made upon the same principle, and that one of great simplicity; but which yet affords the means of producing a more perfect, beautiful, and durable description of carpeting than any other mode of manufacture more recently discovered or introduced.

The manufacture is not carried on in any large establishments; but in pastoral districts, where it is combined with occupations of that nature, and engages a portion of the time of the families employed in that pursuit.

The loom consists of two perpendicular pieces of wood,

fixed at some distance apart, which support a beam or roller; at the top, upon which the warp or chain is wound, and about 2 feet from the floor, is another similar beam, upon which the carpet is rolled as it is made.

The work is done entirely by hand, and each tie passes across the face of two warp threads round the back, and has the ends drawn up between them.

When a row of ties has been completed, a shed is formed in the warp, and the shoot is then passed across from right to left, and returned, binding the whole together, and is beat down to a horizontal level by the hand-beaters. Upon this plan carpets of the largest dimensions are made in one piece. The number of shades or colours that can be used is unlimited, and any design can be copied with great accuracy.

The design and colours of several of the carpets from India, Turkey, and Persia, are especially worthy of notice, and should be studied with a view to imitate their beauties by the manufacturers of other countries. There is one carpet from Cashmere, sent by GHOLAB-SINGH to the Exhibition, made entirely of silk, that cannot be too highly praised for the beauty of its texture, and the softness and harmony of its colouring. In this carpet there are at least 10,000 ties in every square foot. There are other specimens of carpets of small dimensions, but very beautiful, and remarkable for richness and harmony of colours. The exceptions are where an attempt has been made to copy European designs; and there the failure is as great as is the success in those of the native eastern style.

The carpets from Turkey deserve especial notice, as there are, in addition to those made all in one piece, some in breadths, extremely well coloured and closely woven; and an attempt has been made at new designs with considerable success. The carpets from Tunis and Algiers are made upon precisely the same principle, and have the same peculiar character in colouring and design.

The most costly and magnificent carpets of Europe are made upon the same principle as those above described; and that large and beautiful carpet, sent from the manufactory of the Gobelins to the Exhibition, is made by the same process of weaving as the ordinary Turkey carpets; as also are those from Tournay, in Belgium; Deventer, in the Netherlands; Aubusson, in France; London, Wilton, and Millbridge, in Great Britain. The manufacture at Axminster in Devonshire, and Mirfield in Yorkshire, of this description of carpet, generally called "Axminster," ceased to exist about twenty years ago.

The chief seat of the carpet-manufacture in France is the department of Creuze, at Aubusson, Felletin, and Mairissard, where there are probably not less than 5,000 persons engaged in the manufacture of carpets and tapestry.

With the exception of the kind referred to, when describing the carpets from the east, the Aubusson carpets are all made upon the same principle as tapestry, and are consequently too expensive to be purchased by any but the rich. The specimens of Aubusson tapestry and carpets exhibited by Mons. SALLANDROUZE DE LAMORNAIX (1469, France, p. 1246) are especially worthy of notice, being second only to those of the Gobelins and Beauvais. Their merits are not recompensed by a Medal, in consequence of M. Sallandrouze de Lamornaix, as Commissioner for France, having withdrawn from competition.

The manufacture is well represented in the Exhibition, and deserves, for its beauty of design and colours, the highest praise. There is a considerable demand for this manufacture by the noble and wealthy of European nations, and occasionally by the United States. At Turcoing, Nîmes, and Amiens, the carpet-manufacture is also carried on; there being at these three towns nearly 600 looms; and the production is increasing. One of the features of the Exhibition is the progress made by France in the manufacture of moquette or velvet-pile carpets. This branch is of recent introduction in that country, dating within the last twenty-five years; and the specimens exhibited by Messrs. ROQUILLART, ROUSSEL, and CHOCQUET, (1433, p. 1244) of Paris and Turcoing-Nord, are pre-eminent for their artistic designs and beauty of colouring. Some of the specimens of the 5-frame moquette, exhibited by FLAT-

SIER BROTHERS, of Nîmes, are very good. The same manufacture is adapted for floors or for covering furniture; but for the latter purpose, it is made very fine to imitate tapestry, with a velvet surface.

Moquette, Wilton, or velvet-pile, and Brussels carpets, are all woven upon the same principle; the only difference being that in Brussels the wire, by which the pile is raised, is drawn out, and in velvet cut out by a knife. The pattern is formed by haying frames placed over each other, and filled with bobbins of worsted, each frame having for the ordinary width 260 bobbins.

The manufacture of Brussels carpets was first introduced at Kidderminster, about 90 years ago, by workmen brought from Tournay, and has been steadily increasing up to a recent period, when the introduction of Whytock's patent tapestry carpets, together with two other descriptions of carpet, put a stop to its further extension. It cannot be said, however, that the manufacture has been superseded to any extent, as nearly the same number of looms continue to be employed.

The colours in each frame are different, and some of the frames are striped, or planted, as it is technically called, with various colours, when the design to be executed requires it, as in flower patterns, and drawn up by the Jacquard machine now generally used, instead of the old mode of drawing up by hand.

The number of colours, or shades of colour, that can be used in a line is limited to the number of frames of worsted, which rarely exceed five in England, but more frequently extend to six or seven in France. Within the last 20 years, three new kinds of carpet have been invented, and brought into extensive use in Great Britain, all of which are well represented in the Exhibition.

The first in order is Whytock's Patent Tapestry, which has been brought to great perfection within the last five or six years, and now employs about 800 looms, which are not adequate to supply the existing demand. The peculiarity of this manufacture is the unlimited number of shades or colours that can be introduced, so that the most elaborately-coloured designs, with flowers and scrolls, can be executed. The saving of worsted is also very important in an economical point of view. The appearance is the same or similar to Brussels carpet, but the manufacture is more simple, each thread being coloured separately, at spaces, with the various shades as they follow each other in the design. The process by which this is accomplished is beautifully simple and ingenious, but requires much care in placing and arranging the threads, and putting them on the beam. It is also necessary to the economy of this manufacture, that a large quantity of each design should be made.

This invention was patented about 18 years since, and a renewal of the patent granted for a further term of five years, which expired on the 8th September, 1851.

The specimens exhibited by Messrs. HENDERSON and WIDNELL (p. 567), and Messrs. CROSSLEY and SONS (p. 565), show in an eminent degree the capabilities of the manufacture as regards design and colouring.

The next is the "Patent Axminster" of TEMPLETON & Co., of Glasgow, (p. 565) of which there are some excellent specimens exhibited in carpets, rugs, and table-covers.

The object of this invention was to give the beautiful appearance of Axminster, or Tournay, at less cost; and it has been very successfully and extensively applied to the manufacture of rugs, as well as carpets.

The last is a description of carpet, having the same appearance as Brussels, or tapestry, which is woven plain by steam power, and afterwards printed by the same agency.

It is woven at Rochdale by Bright and Co., under Sievier's patent, and printed near Macclesfield, by Burch and Co., by a machine invented and patented by Mr. Burch. This manufacture has already found large sale, more especially for exportation.

Another novelty in the Exhibition is a carpet, rugs, and hangings for walls, of patent wool mosaic, the carpet and rugs being well executed, and the surface or pile peculiarly close. As yet, there has not been sufficient time to see what position this manufacture is likely to take in the carpet trade.

The rapid extension of the carpet manufacture in Great Britain is proved by the fact, that within the last seven years, not less than 700 additional hand-loom have been put in operation, for one of the new fabrics referred to; and looms worked by steam-power, equal to the production of 300 hand-loom for another, without lessening the demand for former fabrics, being an increase of full 30 per cent. in seven years.

Not only has the home consumption greatly increased, but new foreign markets have been opened, and old ones extended.

Several patents have recently been taken for the application of steam-power to carpet weaving, in addition to that referred to of Sievers, and no doubt now exists of this having been successfully accomplished; at all events, for weaving patent tapestry carpets, if not for Brussels of the usual manufacture. This will tend to reduce the price, and, consequently still further stimulate consumption. In fact, there is scarcely any branch of our manufactures that wears a more promising aspect for the future.

The principal seat of the carpet manufacture is Kidderminster, in which there are about 2000 looms, chiefly occupied in weaving Brussels carpets; while the carpets called "Kidderminster" are made extensively in the neighbourhood of Glasgow, Kilmarnock, Bannockburn, and Aberdeen.

They are also made in Yorkshire, Durham, Lincolnshire, and Westmoreland; the largest carpet manufactory in Great Britain being at Halifax.

The number of looms of all kinds may be estimated at 4000, and the value produced at upwards of 1,000,000*l.* sterling.

The average earnings of the operatives will vary from 16*s.* to 28*s.* per week.

The specimens of carpeting from Austria, Portugal, Sardinia, and Prussia, show that the manufacture is making progress in those countries, and is evidence of a growing taste that must ultimately lead to a large increase of consumption on the Continent of Europe.

The numerous exhibitors of Berlin work and their contributions, show that this is still a fashionable occupation among our fair countrywomen, and in addition to those who follow it for amusement, affords employment to a large number of females.

Some of the specimens exhibited are very beautiful; in fact, every description of needlework may be said to be well represented in the Exhibition, and one specimen worked from a cast, and another from a drawing, without the aid of ruled paper, exhibited by FAUDEL and PHILLIPS, are especially worthy of notice.

A specimen of tapestry by a lady (Mrs. ALDERSON) is also highly creditable to the taste and ingenuity of the exhibitor.

The contributions in embroidery of various kinds from India, Turkey, Tunis, and Persia, are extremely interesting, beautiful in taste, and displaying the highest degree of excellence in execution.

#### SUPPLEMENT.

SINCE the Jury closed their labours and separated, some specimens of Brussels and cut-pile carpeting, that merit particular attention, have been placed in the Exhibition by Mr. BIGELOW of the United States, and by Mr. FAWCETT of Kidderminster, as well as by Messrs. JAMES HUMPHRIES and Sons of Kidderminster.

The specimens of Brussels carpeting exhibited by Mr. Bigelow, are woven by a power-loom invented and patented by him, and are better and more perfectly woven than any hand-loom goods that have come under the notice of the Jury. This, however, is a very small part of their merit, or rather of that of Mr. Bigelow, who has completely triumphed over the numerous obstacles that presented themselves, and succeeded in substituting steam-power for manual labour in the manufacture of five-frame Brussels carpets. Several patents have been taken out by different inventors in this country for effecting the same object; but as yet none of them have been brought into successful or extensive operation, and the honour of this achievement, and of great practical diffi-

culty, as well as of great commercial value, must be awarded to a native of the United States.

A similar result is on the eve of being accomplished in this country; and two manufacturers are preparing under different patents to weave Whytock's patent tapestry carpeting by steam-power. This, however, is much more easily accomplished than to weave five-frame Brussels carpets by the same means. The first loom for weaving Brussels carpets by steam-power was the invention of Mr. W. Wood, and patented in 1842; but the feeling of those engaged in the manufacture at that time, being hostile to any change in the then existing state of the manufacture, no attempt was made to introduce it, and many asserted that it was impossible, or if possible that no advantage would result from it.

The error of this opinion is demonstrated by Mr. Bigelow, whose loom will weave 20 yards per day on the average, including stoppages, and requires only the attention of a boy or girl; while the hand-loom will produce on the average only five yards per day, and requires in addition to the weaver, the assistance of a boy or girl to draw out and put in the wires by which the pile is raised.\*

Besides the great economy in labour, there are other advantages. The goods are woven with more perfect regularity, and by means of an invention for weighting the bobbins equally, and at the same time more heavily, the tension of the worsted being thereby increased, a smoother and more even surface is produced, and by the same means a saving in the material effected.

There are in the United States, 28 of Mr. Bigelow's looms at work upon five-frame Brussels carpeting, 50 upon tapestry carpeting, and 450 upon ingrain carpeting (as it is called in the United States), the same description being called Scotch, Kidderminster, or super carpet, in this country.

The invention of Mr. Fawcett is of a different nature, but also important in its results. In Bigelow's, the main feature is a saving in the cost of labour, in Fawcett's a saving of material. The specimen exhibited is cut-pile, but there is little doubt of the principle being applicable to Brussels carpeting also.

As Mr. Fawcett has a patent in progress, the results only and not the mode by which they are obtained are here noticed.

In Brussels carpet made with five frames of worsted, the proportion on the surface is as 5 to 8, and in cut-pile of average quality as 6 to 8 of the whole quantity used. By Mr. Fawcett's mode of weaving, the very important saving of one half of the worsted that is at the back of the carpet is effected, without diminishing the quantity on the surface. The weaving is also more easy and somewhat cheaper; and another advantage is, that ten-frame will be woven as easily as five upon the method hitherto in use; thus affording an immensely increased facility for the improvement of design, and the introduction of additional colours to give proper effect to them.

There is little doubt that Mr. Bigelow's loom can be applied to Mr. Fawcett's invention as well as that of Messrs. Humphries and Sons' improvement, and these two plans combined will produce a much more beautiful fabric than has hitherto been made, at a greatly diminished cost.

The Jury of Class XIX., conjointly with that of Class XXX., have awarded the GOVERNMENT MANUFACTORY OF GODELIN and BEAUVAIS TAPESTRY (1368, p. 1341) the Council Medal for the originality and beauty of design of the different specimens exhibited for furniture, and the extraordinary excellence of execution of most of the productions exhibited.

The Jury award Prize Medals to the following subjects:—

BRACQUENÉ and Co., Paris (435, France, p. 1199), for

\* To prevent misapprehension, it is perhaps necessary to state, that the ingenious invention of M. Sievier, for weaving carpets and other tery fabrics without a wire, is in extensive operation for the manufacture of the plain fabric to be printed in the piece.

Aubusson carpet, tapestry, portières, and table-covers; good designs, colouring, and execution.

BRYNTON and SONS, Kidderminster (110, p. 564), for specimens of patent tapestry carpet, velvet pile, and Axminster rugs.

BURCH, J. and Co., Crag, near Macclesfield (115, p. 564), for specimens of velvet-pile and Brussels carpets, woven by steam-power, and printed; also a fine quality of the same material for hangings.

CASTEL, E., Aubusson (Creuse), (83, France, p. 1175), for Aubusson carpet of fine quality, tapestry-panels, or portières, extremely beautiful, and very finely executed.

CRACE, J. G., Wigmore Street (530, Class XXVI., p. 561), for specimens of Brussels and velvet-pile carpets. The design is unique and well coloured, the style mediæval.

CROSSLEY and SONS, Halifax (142, p. 565), for the great beauty of their patent wool mosaic rugs and table-covers, in design and colours, and also their perfect execution. For the design, colours, and execution of the carpet of the same manufacture, and also for its being the first large carpet ever made upon this principle, and for the designs and colours of the specimens of Whytock's patent tapestry carpets.

DINGLINGER, A. F., Berlin (175, Prussia, p. 1057), for sofa carpets well designed and executed, and for cloths.

DOVE, C. W., and Co., Leeds (155, p. 565), for specimens of five-frame Brussels carpet, of good bold design, and well coloured; also a specimen of five-frame velvet-pile, of good design and colours.

FLAISSIER BROTHERS, Nîmes (Gard), (204, France, p. 1183), for moquette or velvet-pile carpets, and fine moquette for chairs, &c.

HARRIS, G. and Co., Stourport (192, p. 567), for three specimens of velvet-pile carpet, ten frames; excellent in quality.

HENDERSON and WIDNELL, Lasswade (201, p. 567). Specimens of fine tapestry, velvet for table-covers and portières, patent rugs, and Whytock's patent tapestry carpets. The patent rugs are almost a new article, and as beautiful as any hitherto produced at double their price. The first large carpet of centre design ever made upon the principle of Whytock's patent, showing a very ingenious application of it at a small increase of cost. For the merit of the designs and colours of the patent tapestry carpets, especially the dark grounds, which are well executed.

KROONENBURG, W. F., Royal Carpet Manufactory, Deventer (43, Netherlands, p. 1144), for a large carpet of Persian style, of good quality, and well coloured.

LAPWORTH, A. (232, p. 568), for specimens of velvet-pile carpet, one of which is a very good design, and well coloured. Axminster carpets, very fine in quality, also patent Axminster carpet of Persian design.

NEWCOMB and JONES, Kidderminster (257, p. 569), for a velvet-pile carpet; an excellent specimen of colouring and shading, with the use of only five frames.

OVERMAN and DELEVIGNE, Tournai-Savonnerie (297, Belgium, p. 1160), for Tournai-Savonnerie carpet, of very fine quality; carpets of the same manufacture, in imitation of Smyrna carpets; velvet-pile carpets, centre design and bordered.

PARDON, HOOMANS and PARDON, Kidderminster (263, p. 569), for several specimens of velvet-pile carpets, on Whytock's patent principle. Patent Berlin rings.

REQUILLANT, ROUSSEL, and CHOQUERET, Turcoing (Nord), and 20 Rue Vivienne, Paris (1433, France, p. 1244), for moquette, or velvet carpet, excellent in design and colours; also fine moquette for furniture, and Aubusson tapestry.

SMITH (TURNERVILLE), BOYLE, and Co., 9 Great Marlborough Street, London (318, p. 571), for patent tapestry carpets, excellent in design and execution.

TEMPLETON, JAMES, and Co., Glasgow (315, p. 571), for several patent Axminster carpets of good designs, and well coloured. Also rugs and table-covers of the same manufacture.

VICTORIA FELT CARPET COMPANY, Love Lane, Wood Street, London (827, p. 572), for a specimen of printed felt carpet, combining utility and cheapness.

WATSON, BELL, and Co., 35 and 36, Old Bond Street, London (337, p. 572), for Axminster carpet of first-rate quality, good design, and well executed. Bordered Brussels carpet, of Persian design, with centre, extremely good and well coloured.

WHITWELL, J., and Co., Kendal (345, p. 572), for specimens of Kidderminster carpet, and twilled Venetian carpet of great utility and cheapness, well designed and coloured.

WRIGHT, CRUMP, and CRANE, Kidderminster (358, p. 573), for a velvet-pile bordered carpet, five-frame; a Brussels carpet, Persian design; a Brussels carpet, shades of crimson and oaks, &c.

ZUPPINGER, T., Waeudorf, Canton of Zurich (Switzerland, 209, p. 1280), for his invention in weaving chenille into carpeting, by which the outline of the design is more correctly given.

THE Jury make Honourable Mention of the following:—

BROWN, McILAREN, and Co., Scotland (114, p. 564), for specimens of velvet carpet, and three-fly Scotch carpet.

DAUFRIAN, B. and Co., Portugal and Madeira (853 and 881, p. 1315-16), for two very good specimens of Kidderminster carpets.

DUCHEL and SON, Amiens (France), for a moquette carpet, centre design and bordered.

HAAS and SON, Vienna (Austria, 619, p. 1038), for a considerable assortment of moquette carpets; good both in colours and design.

HENDERSON and CO., Durham (200, p. 562), for very good specimens of damask Venetian carpet, and velvet-pile stair-carpet.

HUMPHRIES, THOMAS, Kidderminster (210, p. 567), for a seven-frame velvet-pile carpet, of good quality and design, and well coloured.

LADIES' CARPET NEEDLEWORK (379, p. 573), for the design by Mr. Papworth.

LAROCQUE, SONS, BROTHERS, and JAQUEMET (901, France, p. 1223), for Aubusson carpets of good design and colouring.

LAWRANCE, A. and A., and Co., United States (453, p. 1464), for a specimen of Kidderminster carpet of excellent quality.

LECUN and Co. (1306, France, p. 1239), for Tapis Écossais, good in quality and design.

MORTON and SONS (252, p. 569), for several specimens of velvet-pile carpets.

NEWTON, JONES, and WILLIS, Birmingham (258, p. 569), for specimens of church carpets and hangings, and episcopal robes.

REY BROTHERS (35, Sardinia, p. 1303), for specimens of thick coarse carpeting, of good designs.

SIMCOX, G. P. (London and Kidderminster) (302, p. 571), for specimen of three-thread Brussels carpet, exhibited for cheapness.

WILSON, J. and W., Scotland (351, p. 572), for specimens of Kidderminster (or Scotch) carpets.

WOODWARD, B. HIGGINS, Kidderminster (354, p. 572), for five-frame Brussels carpet, centre design, and bordered, with other specimens.

#### Floor-cloths.

The Jury award Prize Medals to the following Exhibitors:—

ALBRO and HOYT, Elizabeth Town, New Jersey (United States, 183, p. 1449), for specimens of floor-cloths, excellent both in quality and colours.

BURCHARDT and SONS, Berlin (164, Prussia, p. 1057), for printed moleskin table-covers, floor-cloths, and painted window-blinds; a very large and good assortment.

HARR, JOHN and Co., Bristol (180, p. 566), for four large specimens of oil-cloth, the designs, colours, and qualities of which are first-rate.

JONKX, jun., Brussels (306, Belgium, p. 1160), for printed moleskin table-covers, of great variety and cheapness; floor-cloths, and waterproof fabrics of great excellence.

LE CROISIER, — (1305, France, p. 1239), for table-

covers, varnished and printed, on cotton, moleskin, imitation patent leather, and imitation flock.

ROSSLER and HUSTE, Leipzig (161, Saxony, p. 1111), for painted table-covers, and floor-cloths; generally good in designs and well executed.

SABE, J. A., Strasbourg (1009, France, p. 1227), for enamelled floor-cloth, waterproof fabrics, toiles and cotton; excellent in quality.

The Jury make Honourable Mention of the following:—

BARNES, R. Y., floor-cloth manufacturer (95, p. 564), for three specimens of oil-cloth, well designed, and good in quality and colours.

BISIEUX, Paris, (767, France, p. 1217), for oil-cloth, painted imitation of marble and wood on moleskin.

IMM, FERDINAND (48, Grand Duchy of Hesse, p. 1128), for printed and painted moleskin table-covers, of good designs, and well executed.

LEHMANN, M., Berlin (Prussia, 167, p. 1057), for painted moleskin table-covers and floor-cloths, of great variety.

SMITH and BAKER, London (371), for one large specimen of oil-cloth.

In concluding the Report accompanying the decisions of the Jury, I have to acknowledge the kindness of—

Robert Lindsay, Belfast, for that portion relative to the Irish and Scotch embroidery.

D. Biddle, Oxford Street, London, for English and Belgian hand-made lace.

Felix Aubry, Paris, for French lace and embroidery.

— Faessler, London, for Swiss embroidery.

P. Graham, London (Vice-Chairman), for carpets and tapestry.

**JURORS.**—The following Exhibitors being upon the Jury, all notice of the articles exhibited by them has been omitted:—

RICHARD BIRKIN, of Nottingham, machine-made lace.

D. BIDDLE, of London, hand-made lace.

P. GRAHAM (Jackson and Graham, London), carpets.

RICHARD BIRKIN, REPORTER.

July 1851.

## CLASS XX.

## REPORT ON ARTICLES OF CLOTHING FOR IMMEDIATE PERSONAL OR DOMESTIC USE.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

## Jury.

WM. FELKIN, Mayor of Nottingham, *Chairman*, The Park, Nottingham; Lace Manufacturer.  
 PHILIPPE WALTHER, *Deputy Chairman*, Switzerland.  
 T. CHRISTY, *Reporter*, 35 Gracechurch Street; Beaver and Silk Hat Manufacturer.  
 F. BERNVILLE, France.  
 T. BROWN, 40 Wood Street; Straw Hat Manufacturer.  
 ELLIOTT CRISSEN, United States.  
 — HÜLSE,\* Zollverein.  
 E. SMITH, 60 Old Broad Street, City; Clothier.

## Associates.

ROBERT DIXON BOX, 187 Regent Street; Boot and Shoe Maker.  
 E. BLANK, 10 Trump Street, Cheapside; Merchant.  
 WILLIAM BURCHETT, 20 Cheapside; Merchant.  
 ALEXANDER CUMMING, 104 Fore Street, City; Warehouseman.  
 SEYMOUR HADEN, 62 Sloane Street, Chelsea; Surgeon.  
 SAMUEL HODGKINSON, 43 Threadneedle Street, City; Hosiery and Glover.  
 WILLIAM MACLAREN, 55 Cornhill; Boot and Shoe Maker.  
 JOHN BAPTISTE SOLDI, Southwark.

\* E. BLANK, Merchant, 10 Trump Street, Cheapside, Proxy for M. Hülse.

THE extreme variety of the articles submitted to the inspection of this Jury rendered it a task of no small difficulty accurately to appreciate them; and when it is remembered that textile fabrics, or other substances suited for such purposes, have been exhibited from every part of the world, wrought up into "*articles of domestic or personal use*," suited to the habits of the various nations by whom they may have been contributed, too much praise cannot be bestowed upon the industry and perseverance of the numerous exhibitors, who at vast cost have responded to the invitation, and have sent very valuable, and in many instances highly suggestive, contributions to "The Exhibition of the Industry of all Nations."

## HOSIERY.

In 1589 the hosiery knitting trade originated, through the invention of the stocking-frame by the Rev. W. Lee, at Nottingham. It is carried on in Nottinghamshire, Derbyshire, and Leicestershire, at Godalming, and at Tewkesbury, in England; at Balbriggan in Ireland, and at Hawick in Scotland; at Chemnitz and its neighbourhood, in Saxony; at Paris, Gauges, Avignon, Orange, &c., in France. Stocking frames are spread over almost every district of France, Spain, Netherlands, Germany, and Italy: these serve for the production of hosiery, chiefly used in the neighbourhood of the machines. Goods for sale, knitted by hand, are made in Kendal, Aberdeen, and the Shetland Isles, &c. England exports all kinds of hosiery; France chiefly silk hosiery; Saxony exports are for the most part low-priced cotton and woollen hosiery. According to an exact census taken by Mr. W. Felkin, of Nottingham, in 1844, there were at that time 48,482 stocking-frames in the United Kingdom. The annual return from them was 2,565,000*l.*, or thereabouts. This consisted of 305,000*l.* imported raw materials, and 400,000*l.* of home growth; 1,350,000*l.* paid for wages; and 510,000*l.* for finishing and profits. Wages were then at a deplorably low rate, and had been so for the previous 35 years. Since 1844 the number of machines has been

increased to at least 50,000; raw materials have advanced 30 to 60 per cent.; wages have risen about 40 per cent.; and profits have accumulated in proportion. The returns of the hosiery trade of the United Kingdom in the last year were probably about 3,600,000*l.*; and it is satisfactory to have to state that the export trade is extending to all parts of the world; but the chief increase in demand has been for home consumption, amongst the most numerous classes of the community. The number of English hands employed in this manufacture, either constantly or as an addition to domestic duties, is, when trade is good, about 100,000, consisting of a nearly equal number of each sex. Until a few years since, frames were entirely worked by hand in the dwellings of the artisans. They are now slowly collecting into factories, in a few of which steam-power is applied to rotary machinery. A rotary frame stands in the English compartment of Machinery in Motion in the Exhibition; and two others in the French collection of machinery. These may well be compared with the stocking-frame upon Lee's, *i.e.*, upon the usual construction, one of which is at work amongst the English machinery. There are, however (not exhibited), three other very important patented frames, each securing different degrees of speed or facility of production. The most rapid of these is capable of being worked by a youth, and of producing in a week as many frame-work knitted *sacks* as can be cut and sewn up into 7½ to 100 dozens of small women's hose. A specimen of these bleached cotton stockings is in the Exhibition, weighing 14 ozs. per dozen, and offered at 2*s.* 2*d.* per dozen ready for the market. This is certainly one of the most remarkable instances of the power of improved machinery to cheapen production ever seen. The lowest price of English cut-up cotton hose made from the old wide frame, which is shown in the Exhibition, is 3*s.* 7*d.* per dozen, weighing 17½ ozs.

The colours dyed in Nottingham do not generally equal those of the coloured cotton and silk goods dyed for the London, Manchester, and Coventry trades. This deserves the serious attention of the dyers and manufacturers in

that locality. Improvement is certainly practicable, as there is water in the district well adapted for securing brilliancy of colour. The bleach and finish of Nottingham cotton hosiery is unequalled. Leicester hosiery is surprisingly diversified in colour, shape, and adaptation of the articles to every market. One house sends to the Exhibition specimens sufficient to represent fairly their own production, comprising 12,500 articles with prices, employing about 4000 hands, and distributing about 1400*l.* weekly in wages. This spirit of adaptation and improvement in machinery, and diversifying its products to suit the wants of the world, pervades the Leicester trade, and has resulted in the population of that borough being quadrupled in 40 years, having risen from 16,000 to 64,000. No means are available for ascertaining the extent of hosiery production in France. French cotton hosiery is generally of uneven materials; but their silk hosiery is of superior materials. The machinery is in less perfect order than that of the English. The evening of their embroidered hose is very beautifully designed and executed. In the Saxony Catalogue of goods in the Exhibition, their machines are stated to be about 30,000, employing 45,000 hands. Their lowest specimen of cut-up small women's hose is at 3*s.* 6*d.* per dozen, weighing 18½ ozs., half hose 1*s.* 10*d.*, and cotton gloves 1*s.* 6*d.* per dozen, all made no doubt with a view to exportation. This trade has been remarkably rapid in its progress, having risen from a trifling amount to its present extent within the present century. Saxony hosiery, as compared with English, is, from the machinery being too often in an imperfect state, liney, short-looped, and therefore finer for gauge; but less elastic and less durable, from the same cause. There is less substance in hand than, from the actual weight of materials used, there ought to be. The materials are less even in quality than those employed in the English trade. Honourable Mention has been occasionally spoken of in the following recommendations, as suitable for the meritorious workpeople referred to, and in a few instances for exhibitors who have aided the completeness of this Class. It will be observed, that no recommendation is offered for the Council Medal. The Jury do not think any of the productions exhibited present originality or inventive power justifying the award of that medal. But the merit of promoting excellence of quality, diversity of useful products, low prices of goods suitable for the mass of consumers at home and for exportation, and consequent increase of employment, has been eminently exhibited in this Class.

The Jury award Prize Medals to the following Exhibitors, and ~~for~~ the subjects indicated:—

ALLEN and BOLLY, Nottingham (100, p. 583), for sound and well-made articles, and a selection showing the improvement in the hosiery trade, especially in the materials used at the dates 1700, 1790, 1804, 1810, 1812, 1815, 1826, and 1848.

ANGRAVE BROTHERS, Leicester, Manufacturers (202, p. 588), for drawers and shirts of excellent quality.

BIGGS, H. W., and SONS, Leicester, Manufacturers (205, p. 588-9), for the general excellence of the specimens of hosiery, adapted to every market where worsted and low-priced cotton stockings, gloves, and woollen shirts are in demand.

BILLSON and HAMES, Leicester, Manufacturers (201, p. 588), for the excellence in quality of Thibet wool, and a great variety of socks.

CARTWRIGHT and WARNERS, Manufacturers, Leicester (196, p. 588), for worsted yarns prepared by them from Merino and Vigonia wools, and for general excellence of the articles manufactured therefrom.

CHENOIS and COLIN, 7 Rue des Déchargeurs, Paris, France (124, France, p. 1177), for good quality and embroidery.

FAY, J., Godalming (193, p. 588), for Lisle thread hose of excellent make, and very regular materials, and for well-finished Segovia goods.

GLASSER, J. S., Jun., E. Chemnitz, Saxony (72, 83, p. 1108), for women's coloured cotton gloves.

HANNA, R., and SONS, Leicester, Manufacturers (198, p. 588), for an extensive collection of examples of hosiery

of every kind, adapted to the most varied markets, for superior excellence in production, alike as to pattern, colour, and finish, and as a recognition of the encouragement of inventions and adaptations of machinery in the manufacture of hosiery.

HOLLAND, T., and Co., Godalming (194, p. 588), for fleecy hosiery, having special reference to medical uses, and the comfort of invalids, and for Merino and Segovia goods of the most superior quality.

HURST and SONS, Nottingham (89, p. 583), for the excellence of a general assortment of articles suitable for the home and export trade.

LANDGRAFF, GOTTFRIED, Hohenstein (Saxony, 72, 83, p. 1108), for women's single-thread cotton-hose.

LAURET BROTHERS, 19 Rue des Mauvaisés, Paris, and GAUGE (903, p. 1223), for embroidered silk-hose of very high quality; also for embroidery in colours and general excellence of production.

MCDONNELL, D., Inverness, Scotland (83, p. 582), for knitted hosiery, &c., and as a recognition of his efforts to create habits of self-dependence and a love of labour amongst the peasantry of the Highlands of Scotland.

The Jury consider that this exhibitor is entitled to this distinction as much for the superiority of the articles he exhibits, as in consideration of the circumstances under which they are produced. The peasants of Argyllshire, Ross-shire, &c., are afforded employment in knitting while attending flocks, and during other desultory employments. Cotters, once half starved, he states, now possess money, thus carried, placed in the savings-banks. The wool is cleaned, combed, and prepared by the peasants; dyed by themselves, where colours are desired; brown, from a lichen called *crothol*; yellow, from the tops of young heather; black, from alder bark; lemon, from furze flowers; and olive, from the roots of the water-lily. All these substances are at hand and well known to them. Stockings and socks of various patterns and qualities, thus knitted from home-dyed or self-coloured wools, are exhibited, as well as pieces of Tweed woven from the same materials. This exhibitor pays 300*l.* to 500*l.* per annum for socks alone; and all this class of products are exported to Hong Kong, Shanghai, and other distant parts, at from 12*s.* to 24*s.* per dozen pairs, besides being used in Scotland itself somewhat extensively. The Jury desired to have recognised the first preparer and dyer of wool, together with the best and most thrifty knitter, had it been possible to have ascertained this with accuracy.

MCKENZIE, W. B., 126 Prince's Street, Edinburgh (142, p. 585), for Shetland knitted shawls and hose. The former are of very fine materials.

MEINERT BROTHERS, Oelsnitz, Saxony (72, 83, p. 1108), for woollen shirts of excellent make and good colour, for exportation.

MEYRUEIS and SONS (639, France, p. 1208), for extra fine white embroidered silk-hose, and excellence of ankle embroidery in colours.

MILES, S., Bunhill Row, London (89, p. 582), for an extensive collection of articles of dress.

MILON, P. D., sen., 98 Rue St. Honoré, Paris, France (930, France, p. 1224), for superior workmanship of hose, and for excellence of embroidery.

MORLEY, J. and R., Nottingham and London (101, p. 583), for great excellence in the manufacture and finish of silk and cotton hose, suited to the best demand of the London and other markets, and for silk gloves of superior make, colour and finish. The exhibitors send from the coarsest to the finest gauges in silk and cotton hose, the latter requiring a considerable magnifying power to discern the loops, and though a dozen of the silk hose weigh only 3½ ozs., they are perfectly made in quality, and of the most regular materials. The silk in each pair cost 1*s.* 3*d.*, the workmanship 1*s.*

NACKE and GEHRENSACK, Chemnitz (72, 83, Saxony, p. 1108), for women's cut-up white cotton hose of fine quality.

NEUBER, F., Chemnitz (72, 83, Saxony, p. 1108), for white and brown cotton hose, adapted to exportation from their low prices.

NEVILL, A., and Co., 121 Wood Street, London (20, p. 578), for excellence of production in ladies' under-

clothing, to fit the shape, and gentlemen's pantaloons and drawers of similar character; also for excellence of quality and make of Saxony wool shirts, and hose manufactured for the Spanish and other markets.

SOLBRIG, F., Chemnitz (72, 83, Saxony, p. 1108), for adaptation in price to export demand in certain qualities of hosiery.

TAYLOR and Co., Rochdale (127, p. 587), for plushes manufactured from waste silk, and the use of that material, which is of comparatively small value for the manufacture of articles of general utility.

THRESHER and GLENNY (79, p. 581), for a fabric for under-clothing in warm climates.

THURMANN, FIGOTT, and Co., Nottingham (92, p. 583), for a good collection of self and parti-coloured patent floss and floss-velvet gloves, of very superior dyes. The former are flossy within, and run in with the needle after the fabric is made; the latter have the velvet-pile outside the glove.

WARD, STURT, SHARP, and WARD, Belper, Derbyshire (195, p. 588), for examples of nearly every class of stockings and gloves, made from silk or cotton yarn, of great excellence, whether as to make, colour, or finish, or adaptation to various markets; and also for the lowest sample of cut-up hose in the Exhibition.

WEX and LINDNER, Chemnitz (72 and 83, Saxony, p. 1108), for hosiery of great excellence, suitable for general use.

WILSON and SON, Balbriggan, Ireland (183, p. 587), for excellent thread hosiery, with lace fronts.

The Jury make Honourable Mention of the following Exhibitors:—

BIDDLE, JOHN, Leicester, Manufacturer (207, p. 589), for warp in hares'-fur, and Saxony wool goods, spun silk, cloth, hares'-fur gloves, and Vienna wool articles.

COAHN, H., and SONS, Leicester (208, p. 589), for the very creditable character of their contributions.

HADDEN, A., and SONS, Aberdeen, Manufacturers (134, p. 585), for specimens of dyed wools in every shade of colour.

HUNSON, JAMES, Leicester, Manufacturer (199, p. 588), for good Vigonia hosiery, black worsted hosiery, and an imitation of Shetland half-hose.

LART, JOHN, and SON, Nottingham, Inventor and Manufacturer (81, p. 582), for articles of clothing fashioned to fit the bust and waist of the wearer, and registered gusset to band, 70s lace insteps of No. 200 yarn. The workman who made the latter article also deserves commendation.

MUNSON, R. and J., Nottingham, Manufacturers (97, p. 583), for superior plaited gloves, and good plain silk gloves.

POPE and PLANTE, 4, Waterloo Place, Pall Mall, London, Manufacturers (6, p. 576), for surgical elastic belt, sock, &c.

SHAW, JOHN, Radford, near Nottingham (91, p. 582), for his application of the principle of the Jacquard to the stocking frame.

WHEELER, T., and Co., Leicester (206, p. 589), for the application of the stocking frame to weaving shawls.

The Jury also make Honourable Mention of JOHN RICHARDS, jun., Riste Place, Nottingham, the maker of the silk hose, No. 1000, exhibited by Messrs. J. and R. MORLEY (105, p. 582), for the great skill displayed therein.

#### BOOTS AND SHOES.

Boots and shoes have been exhibited manufactured from almost every description of material, and from most parts of Europe and the United States; in some instances great novelty of construction and adaptation have been manifested, but we have chiefly to remark upon the greater or less amount of skill attained, in producing an article of fashionable use.

On a review of the whole of the boots and shoes of every class and description exhibited to the Jurors, the conclusion arrived at is, that the improvements which have been made during the last five or six years by the English manufacturers have enabled them to compete with the foreign; the introduction of foreign leather

since the alteration of the tariff a few years back, as well as foreign boots and shoes at a lower rate of duty, has had the effect of rousing the energies of the English manufacturers, and of calling forth the requisite talent to bring about the results before alluded to; and not the least remarkable part of the question is the fact, that the increase in the consumption of English boots and shoes has not been less (in the period before named) than 20 per cent.

From France, it must be observed, that in many cases, exhibitors have shown goods remarkable for qualities more esteemed in the country for which they are required than in our own; and such goods must not be regarded entirely with an English eye.

The Jury award Prize Medals to the following Exhibitors:—

ARDINGTON, W. H., Norfolk, Virginia, United States (471, p. 1465), for very strong shoes for mining purposes.

ATLOFF, J. G., 69, New Bond Street, London, Inventor (32, p. 578), for a novel and economic plan of cutting, by which a short boot can be made at nearly the same cost in material as a shoe.

BATHIER, V. (Creuse), France (22, France, p. 1172), for novelty and cheapness in the production of wooden shoes, with leather applied to the top of the soles; and for the taste displayed in the manufacture.

CHRISTL, J., Vienna (327, Austria, p. 1023), for strong and excellent workmanship.

CLARKE, CYRUS and JAMES, Street, near Glastonbury, Inventor and Manufacturers (48, Class XVI., p. 520), for elongating goloshes, elastic insertions on the instep, both useful and novel, and an excellent assortment of ladies' shoes in various styles.

DESCHAMPS, N., 14, Galerie d'Orléans, Palais National, Paris (1185, France, p. 1234), for his plan of cutting without block a front in one piece of leather.

DUFOSSE, sen., 13 Rue St. Dominique, Paris (1200, France, p. 1235), for solid and excellent work. The Jury consider that Honourable Mention ought to be made of the workmen who produced the best.

DUFOSSE and MELNOTTE, 20 Rue de la Paix, Paris (1201, France, p. 1235), for excellence of workmanship in boots and shoes. Honourable Mention is also due to the workmen who produced the best articles.

GILBERT and Co., 13 Old Bond Street, London (179, Class XVI., p. 525), for riding-boots, of excellent manufacture, produced with great care and attention.

GROSKOPF, GEORGE, Vienna (343, Austria, p. 1024), for strong and good boots and shoes, of excellent workmanship.

HEFFORD and EACER, Derby (150, Class XVI., p. 525), for glazed Wellington boots, of excellent workmanship, elaborately and beautifully "studded." Honourable Mention is also due to the workmen who produced them.

HICKSON and SONS, 20 West Smithfield, London, Manufacturer (192, Class XVI., p. 526), for general excellence of the lighter kind of export and other goods.

HOCK, JOHN, 66 Bond Street, London, Manufacturer (114, Class XVI., p. 523), for the superior workmanship, great excellence, and beauty of ladies' shoes.

JEFFERS, W. H., 467 Broadway, New York (116, United States, p. 1441), for a case of ladies' boots and shoes, of exquisite workmanship; the Prize Medal to be awarded to the workman, and Honourable Mention to the manufacturer.

KUNRUTH, ANTON, Vienna (333, Austria, p. 1023), for magnificent slippers in the Turkish style, of excellent work and elegant appearance.

LEFEBURE, J. P., 14 Rue du Paradis Poissonnière, Paris (578, France, p. 1205), for a remarkable invention for making boots and shoes by means of brass screws, the work being pressed together by an extraordinary pressure, thereby preventing damp from entering. There are, also (by the same exhibitor), other mechanical contrivances for cutting out the various parts of boots and shoes, combining great novelty and utility.

MANBEZ, —, 34 Rue Aubyle Boucher, Paris (1347, France, p. 1240), for excellence of production relative to price, the articles being at once cheap and well made.

**MARIN, P.**, 17 Rue Froncliet, Paris (1852, France, p. 1240), for the great excellence of the workmanship of ladies' shoes, and beauty of finish. The Jury also desire to make Honourable Mention of the workman or workmen who executed them.

**MOHR, W.**, Berlin (1861, Prussia (I. Zollv.), p. 1058), for clogs of light and elegant quality, and for kid boots.

**PARKER and Sons**, Northampton, Manufacturers (116, Class XVI., p. 524), for general excellence.

**PARKER, J.**, 65 Dame Street, Dublin, Manufacturer (242, Class XVI., p. 521), for excellence of work in strong boots, and the great care evinced in the light boots. It is desired to make Honourable Mention of the workman who produced the stout work.

**PEPLOW, W.**, Browning Street, Stafford (157, Class XVI., p. 525), for workmanship of a high character, and the application of an elastic spring.

**POINTEZ, P.**, Châteaubriand (Loire Inférieure), France (1398, France, p. 1243), for the excellent quality and make of self-coloured leather boots, for very hard wear. These articles are highly esteemed in France, and fulfil the peculiar requirements of the market for which they are made.

**POPINOFF, SOPHIA**, of Tiflis (310, Russia, p. 1376), for shoes, slippers, and other articles of usual and useful wear. The Jury also desire to make Honourable Mention of three workmen.

**SERKOWIN, ALEXIS**, Government of Novgorod, town of Novgorod (275, Russia, p. 1375), for embroidered boots and shoes, and other goods, of the highest class of workmanship in boots.

**THERRI, C. A.**, 301, Rue Gré, Paris (391, France, pp. 1198-97), for gentlemen's boots of great excellence. The Jury desire to make Honourable Mention of the best workmen by whose skill these were produced.

**THOMAS and Son**, 36, St. James's Street, London, Manufacturers (211, Class XVI., p. 527), for high-class workmanship in boots.

**WALSH, WILLIAM**, 7 Buckingham Place, Fitzroy Square, London; Manufacturer (207, Class XV., p. 526), for welled cork soles of high merit as to workmanship.

**WEMMER, J.** (3, Luxemburg, p. 1130), for the excellent quality of shoes for labouring men, and for cheapness, and a novel principle in the nailing.

The Jury make Honourable Mention of the following Exhibitors:—

**ADOLPH, C. F. W.**, Berlin (172, Prussia (I. Zollv.), p. 1057), for a case of well-made ladies' boots and shoes.

**ALLEN and Son**, Pembroke, Wales, Manufacturer (149, Class XVI., p. 524), for a stout-made boot.

**BEARN and Jeffs**, Parade, Northampton, Manufacturer (118, Class XVI., p. 524), for "stabberly" of the very highest class. The workman who executed it is deserving of Honourable Mention.

**BECKETT, GEORGE**, 41 Fenchurch Street, Manufacturer (220, Class XVI., p. 527), for well-made boots and shoes.

**BRIDARD, J.**, 43 Rue Vivienne, Paris (1115, France, p. 1322), for strong boots and shoes.

**BREDDIFF BROTHERS**, 5 Rue Colbert, Tours, Manufacturer (73, France, p. 1175), for strong and very good shoes.

**BROWN, N. A. and Co.**, Lynn, Massachusetts (411, United States, p. 1462), for very good shoes for children.

**CARR-FABRIZI, Manufacturer** (263, Belgium, p. 1159), for boots for exportation, and their excellence relative to price.

**CLARK, B.**, Whitehaven, Cumberland, Manufacturer (154, Class XVI., p. 525), for a lady's boot "clumped" with wood.

**COWLING, J.**, Richmond, Yorkshire, Manufacturer (142, Class XVI., p. 524), for easy shooting boots of excellent workmanship.

**CRANK, JAMES**, Wisbech, Manufacturer (141, Class XVI., p. 524), for stout boots.

**Cyprianis**, (1582, France, p. 1252), for varnished skins and boots made therefrom.

**DAVE, W.**, Gloucester, Manufacturer (145, Class XVI., p. 524), for very strong and well-made navigator's boots.

**DÖRR and REINHARDT**, St. Worms (33 Grand Duchy of Hesse, p. 1128), for two pair of excellent boots.

**FRIEDL, LEOPOLD**, Vienna (332, Austria, p. 1023), for ladies' boots and shoes.

**FROMONT-CLOUS**, 15 Rue Neuve St. Marie, Paris (203, France, p. 1183), for boots and shoes, and well-made wooden shoes, adapted to persons obliged to work in the wet.

**GARNER, D.**, 41, Finsbury Market (230, Class XVI., p. 521), for "lasts."

**GORDON, E.**, 6A Prince's Street, Leicester Square, London, Manufacturer (212, Class XVI., p. 527), for well-made screwed clamps solid boots, "pegged waist."

**HELLA, JOHN**, Vienna (331, Austria, p. 1023), for an assortment of ladies' boots and shoes, suitable for the class of wearers for whom they are intended.

**HUNERT, C.**, 202, Regent Street, Manufacturer (194, Class XVI., p. 526), for ladies' and gentlemen's boots, and a lady's boot made from a single piece of leather.

**JACOBS and DEPTIS**, 32 Rue de la Paix, Paris (886, France, p. 1222), for ladies' boots and shoes suited to the higher classes of society, very well made.

**LANGDER, J.**, Vienna (329, Austria, p. 1023), for good examples of boots and shoes.

**LEBKER**, Petersburg (311, Russia, p. 1376), for clogs and goloshes.

**LONGDON, R. and Sons**, Derby, and **THOMAS SMITH**, Bedford (119, Class XX., p. 584), conjointly, for the introduction of the elastic welt into boots and shoes.

**MILIKI, jun.**, Warsaw (234, Russia, p. 1374), for exceedingly light well-made boots, weighing only three ounces.

**NORMAN, SAMUEL WILLIS**, 4 Oakley Street, Lambeth (167, p. 586), for excellence of work in lady's cork-soled boots.

**PEAL, NATHANIEL**, 11 Duke Street, Grosvenor Square (197, Class XVI., p. 526), for two pairs of very good fishing or hunting boots of excellent workmanship.

**RAPP, C. F. and Son**, 22 Rue Feydeau (974, France, p. 1226), for tasteful-looking goods.

**ROBERT, A.**, 123 Regent Street, London (224, Class XVI., p. 527), for excellence of workmanship.

**SCHUMACHER, jun.**, Mayence (47, Grand Duchy of Hesse, p. 1128), for well-made gentlemen's boots and shoes, "spring-fastened."

**SCOTT, S. T.**, Union Street, Southwark (228, Class XVI., p. 527), for a "last" with an adjustment to elongate the model of the foot; a very useful and ingenious improvement.

**SUSER, H.**, Nantes, and **La Morinière** (Loire-Inférieure) (1022, France, p. 1227), for boots and shoes made for exportation. (Prize Medal awarded in Class XVI.)

**TOLTSCHKOFF, V.**, Government of Nijni Novogorod (314, Russia, p. 1376), for curiously made felt shoes, produced by the peasants of the country.

**VANDEROORT, M.**, Brussels, Belgium (427, p. 1164), for boots of excellent quality.

**VIAULT-ESTÉ, J. J. J. B.**, 17 Rue de la Paix, Paris (725, France, p. 1214), for a very handsome case of ladies' shoes.

**WILSHIN, S. B.**, 86 Albany Road, Camberwell (205, Class XVI., p. 526), for a method of fastening skates to boots.

#### GLOVES.

The article of gloves, on the manufacture of which so much skill and talent have been of late years brought to bear, employs a large amount of the population of the United Kingdom. We have to report many very valuable and highly important contributions, prepared with great skill, and exhibiting this branch of industry in every form in which it can be presented. France, particularly Paris, many cities included in the Zollverein, and some in Denmark and Switzerland, have also contributed specimens of gloves. It will be needful to remark, in the first instance, upon the great talent of the French dyers of kid skins: in one case as many as 94 different colours are exhibited in the article of ladies' kid gloves; and various other descriptions are shown, particularly in lamb and sheepskin gloves, wherein great skill is exhibited; but it

appeared to the Jury, that French gloves being so very largely imported into this country, some of the more important foreign manufacturers possibly considered that their articles were sufficiently well known, and did not think it worth while to send any contributions to the Exhibition. The ASSOCIATED GLOVERS at Prague have forwarded a highly-interesting contribution, which illustrates the state of this branch of industry in their city, in a manner highly creditable to their skill. In conclusion, we may observe, that since the alteration of the tariff, and the importation of French kid skins, a rapid advance has been made by the English manufacturers, their skill and energies having been greatly called forth thereby.

The places at which gloves are chiefly made, are, London, Yeovil, Worcester, Woodstock, Torrington, Hexham, and Witney; and the value of the yearly produce is estimated at about a million sterling. Total of hands employed in England is about 46,000.

The Jury award Prize Medals to the following Exhibitors:—

**BALL, W. Y. and Co.**, 32 Wood Street, Cheapside (80, p. 581), for a variety of kid gloves, remarkably well made.

**CROSSON and Co.**, 63 Rue Montmartre, Paris (1150, France, p. 1233), for ladies' and gentlemen's kid gloves.

**DENT, ALICHOFF, and Co.**, Worcester (78, p. 581), for a very handsome and interesting collection of gloves, showing the various kinds produced in England; with very few exceptions, of the highest class of workmanship.

**ESSON, T.**, Milborne Port (185, p. 587), for two-finger gauntlets, and various gloves, exhibiting very good taste.

**FOSTER, PORTER, and Co.**, 47 Wood Street, Cheapside (2, p. 575-6), for plush plumage gloves of good quality, forming a variety of novel and fashionable articles.

**FOWNES BROTHERS**, 41 Cheapside, London (82, p. 582), for Irish kid, English dressed men's round seam gloves, of good quality.

**HODDIGNANT-CHARDIN**, Rue du Faubourg St. Honoré (1627, France, p. 1256), for an assortment of gloves of excellent quality and colour, and very well sewed.

**JOUVIN and JOYON**, 8 Boulevard Bonne-Nouvelle (1279, France, p. 1238), for a great variety of kid gloves of ninety-four different colours.

**JOUVIN (Widow)**, Xavier (893, France, p. 1222), for many specimens of gloves of very good quality.

**LAYDET and Co.**, 27 Rue de Grenelle St. Honoré (296, France, p. 1191), for a case of gloves very well sewed.

**LECOQ-PREVILLE**, 50, 52, 53, Passage du Saumon, Paris (1303, France, p. 1239), for an assortment of habit kid gloves of good quality and taste.

**PRAGUE, Glovers' Association of** (336, Austria, p. 1023), for a very handsome contribution of gloves of various descriptions.

**WHITBY, E., jun.**, Yeovil (186, Class XX., p. 587), for habit lamb-skin gloves, of a superior quality and very well made, the trade being prettily illustrated in the manipulation.

#### HATS.

In this branch of industry, examined by the Jury and Associates, important from the large number of persons employed in its various ramifications (scarcely less than 60,000), there have been numerous contributors; London, Manchester and other parts of Lancashire, Cheshire, Germany, France, particularly Paris, the Netherlands, and the Zollverein, have, at considerable cost, forwarded illustrations of their manufacture. The specimens may be divided into four different classes—1st. The old make of beaver hats, with nap; 2nd. The silk plush hat on foundations of cotton, linen, and other fabrics; 3rd. The felt hat (some specimens were shown in pure beaver fur), chiefly of hare's fur, or rabbit's fur; 4th. Hare's fur or rabbit's fur, mixed with lamb's wool, for lower or cheaper qualities. In all these descriptions of goods, the manufacture of each country is necessarily in conformity with the taste, style, and habits of the people; whence the various productions in this Class are highly suggestive

and interesting. In the British contributions there are several very novel styles introduced, wherein the manufacturers have given considerable latitude to their fancy; but in an article of fashion, and of such constant use as hats, it does not appear to be easy to change the habits and tastes of the wearers, or to induce them to adopt a new costume. The specimens, where attention has been chiefly directed to excellence in quality and very high finish, are commendable, and form an interesting feature in this section of the Exhibition.

The manufacture of hats ranks as one of the oldest of the staple manufactures for which England is celebrated, and at an early period hats were articles of considerable export. They have been the subject of many legislative enactments; and it was not until the close of the last century that they were freed from Government interference, by the abolition of the stamp duty, which up to that time was chargeable upon them.

**CHRISTY and Co.** (35, p. 578-9), of 35 Gracechurch Street, London, and of Stockport, near Manchester, have contributed a most complete and interesting illustration of the manufacture of hats, both in beaver and silk, consisting of materials in the raw state, prepared for use, and in the different stages of manufacture up to the finished state, as made for the home, colonial, and foreign markets, together with the tools used in the manufacture.

Although this exposition completely fulfils the object proposed in the Exhibition, and the manufactured specimens are of the highest class, the Jury are unable to award the prize to this house, from the circumstance of its being one from which a juror has been selected.

The Jury award Prizes to the following Exhibitors:—

**BENNI and MELLARD**, 56 and 57 Great Guildford Street, Southwark (103, p. 583), for a case of hats of various styles, well manufactured.

**CHENARD BROTHERS**, Paris (87, France, p. 1175), for a beaver hat, and two hare's fur hats, made upon the old Flemish principle, and very well done.

**COUPLIN, J.**, Aix, Rhone, Rue de l'Aigle d'Or (1662, France, p. 1233), for some felted hats "in the rough," very well felted, and good in quality.

**SIMMONDS and WOODROW**, Oldham (105, p. 583), for a selection of felt bonnets of good quality, and handsomely got up, in pure beaver and other furs.

The Jury have made Honourable Mention of the following Exhibitors:—

**BATON, W. and SONS**, Rue St. Avoie, Paris (1069, France, p. 1129), for hats made of hare's fur, on the Flemish principle, and exemplifications of the various stages of manufacture.

**BRAUND, J.**, 26 Mount Street, Grosvenor Square (66, p. 581), for a cap with transparent talc peak, useful for travellers.

**LYONS, J.**, 12 and 13 Artillery Place, Woolwich (67, p. 581), for military caps, which will resume their shape after having been folded in a knapsack.

**MELTON, H.**, 194 Regent Street, Manufacturer (54, p. 580), for a lady's elegant lavender-coloured riding hat.

**PEARSON, J.**, Stockport (126A, p. 584), for a child's bonnet and feathers.

#### ARTICLES FOR GENERAL OR PERSONAL USE.

The almost infinite variety of articles in this class, although possessing great merit and excellence, do not, except where specially noticed and recommended by the Jury, exceed what may be obtained in the ordinary way of trade, and although many of these contributions are valuable, and exhibit great skill and talent, serving to complete this department of the Exhibition, it has not been deemed necessary to do more than mention them in general terms.

#### Upper Clothing.

Considering the vast extent and variety of this branch of industry in every part of Europe, it is almost impossible to give a summary which will do justice to the

talent and ingenuity displayed by many individual contributors. In the fashionable articles of dress presented, not only from the metropolis, but from many of the largest towns of the United Kingdom, great skill is exhibited; and when to these are added the leather coats richly embroidered and lined with skins and furs from the northern parts of Europe, the richly embroidered dresses of Hungary, Russia, Tartary, Turkey, Egypt, China, and India, of exquisite workmanship, and in many cases made up with the greatest ingenuity to repel the cold, it is imperative on the Jury to call attention to the high merit due to the contributors of this vast assemblage of merchandize, and to bear testimony to their great and persevering industry. The cursory observer passing from section to section, may indeed admire the various productions of art; but those alone whose duty it has been to visit every individual contribution, and examine it in detail, can justly appreciate the vastness of the effort by which it has been made.

The importations of wool for home consumption in the manufacture of cloth, exclusive of that of our home growth, was, in the year 1849, 279,472 bales, or about 56 millions of pounds. It is not possible to estimate the number of yards of cloth into which the said wool is wrought, or the various articles made therefrom; but it is evident that the working up of cloth into clothing "*for immediate personal or domestic use*," must necessarily employ a large mass of the population. In London alone, it is estimated that there are 30,000 persons employed in making up clothes for men. It must be remarked and regretted, that the Exhibition has received no contributions adequately representing either the British or foreign superior "*tailoring department*," or the article produced by the ready-made and slop-selling departments, employing so many thousands of hands, in which also a large capital is embarked, and from which sources, whether it regards Great Britain or foreign countries, the army, navy, and other Government institutions, public bodies, the commercial marine, and, to a great extent, the colonies, derive their supply of clothing.

The Jury award the Prize Medal to the following Exhibitors:—

BUCKMASTER, W., and Co., 3 New Burlington Street (1A, p. 575), for a very handsome blue frock coat, and various articles of Court costume; exhibiting great taste and improvement in this kind of dress.

KRACH, BROTHERS, Prague (391, Austria, p. 1029), for double pilot-cloth, to form a coat either side outwards of a different colour, and coats of excellent workmanship.

MALÁTEJZKY, E., Hungary (394, Austria, p. 1029), for richly-embroidered over-coats.

MCGEE, JNO. G., and Co., Belfast, Manufacturers (118, p. 584), for several extremely elegant waistcoat pieces, the patterns for which were produced in the School of Design, Belfast.

OPICZ and CHAZELLE (336, France, p. 1493), for very excellent embroidered silk, wrought up into dresses of elegant style.

SINGER, J., Pesth, Hungary (392, Austria, p. 1829), for several very good dress coats.

WELCH, MARGETON, and Co., 17 Cheapside (212, p. 589), for a very elegant contribution of braces, carriage rugs, ties, cravats, handkerchiefs, shirts, robes, &c.

The Jury make Honourable Mention of the following Exhibitors:—

BALLF and Co., Schoenenwerd (210, Switzerland, p. 1280), for a display of braces, of merit and moderate price.

BRIQUET and PERRIER, 22 Rue Jean Robert, Paris (1116, France, p. 1232), for a case of elegantly-wrought braces.

FARRANGE, Miss, Bray, County Wicklow (176, p. 587), for some very beautifully-knitted stockings.

HARDING, T., 108 Regent Street (211, p. 589), for real agate buttons, good both in style and taste.

HARRIS and TOMKINS, Abingdon, Berks (111, pp. 583-4), for two smock frocks, exceedingly well made by two cottagers.

HOLMES, J., and Co., 171, Regent Street (84, p. 582), for a very elegant shawl cloak, of new design.

HURT, Widow, Rouen (270, France, p. 1189), for a great variety of elastic very well made.

KEARSE, T., Limerick (175, p. 587), for a novel plan of inserting india-rubber in articles of dress.

LABOURDIN, 88 Rue du Marais, St. Martin, Paris (1416, France, p. 1244), for elegantly-made braces, at very moderate prices.

SAYCE, J., and Co., 57, Cornhill (307, Classes XII. and XV., p. 501), for a very light coat called "*Piuma Coat*."

SOLOMON, Mrs. S., 52 York Road, Lambeth (86, p. 582), for an embroidered ball dress.

STEWART, JANE, Templetrine Glebe, Bunder, Ireland (177A, p. 587), for some very elegant knitting.

VINCENT, RICHARD, Glastonbury (177, p. 587), for a suit of clothes made of black dyed and prepared sheep skins; a new application of this material.

WALKER and BARN, 306 Strand (63, p. 581), for an alpaca coat sufficiently light and portable to be carried in the pocket.

### Shirts.

On carefully examining the shirts, our opinion is, that in the finer quality, into which embroidery enters largely, the French are superior; there is but a small exhibition from wholesale houses, and scarcely any of a low quality; the collection, therefore, embraces only the higher class of goods. This branch of our industry is an article of fashion, and the number of persons employed is much on the increase. In the better classes of work, the hands obtain for their labour prices which afford them a fair livelihood, their earnings amounting from 2s. to 12s. per week: the shirts for which wages of 2s. each shirt are paid, enable the quick workwoman to earn about 2s. per day; but it must be observed, that by the division of labour, an increased amount of wages is earned relatively, and the work is thereby considerably enhanced in quality and skill. These observations apply solely to the higher class of shirt-making.

The Jury award Prize Medals to the following Exhibitors:—

DOUCET and DUCLEUC, A., 21 Rue de la Paix, Paris (147, France, p. 1178), for shirts, embroidered with crests and names, of good shape and make; and for various other articles.

HAIGHT, Mrs. W., New York (385, United States, p. 1461), for a plain shirt, of good shape, and very good work; a light material, suited to hot climates.

MOREAU and Co., 22 Rue d'Enghien, Paris (652, France, p. 1209), for some exquisitely-embroidered shirts of good shape, suitable for French wear.

The Jury make Honourable Mention of the following Exhibitors in this division:

BRIE and Co., 189 Regent Street, London (24, p. 578), for attached shirt collar to a waistcoat; the waistcoat of excellent shape. (Prize Medal awarded in Class XIX.)

DARNET, Rue Richelieu, Paris (1578, France, p. 1252), for very elegantly-embroidered shirts. (Prize Medal awarded in Class XIX.)

HAYEM, —, sen., 38 Rue du Sentier, Paris (1265, France, p. 1237), for exceedingly beautiful cravats.

SCOTT, P., Edinburgh (141, Class XX., p. 585), for fine-breasted shirts, and several collar-shirts.

SMITH, J. E., 3 Lawrence Lane, London (29, p. 578), for a shirt without seams or gathers; and Moravian needlework.

SOCIETY OF NEEDLEWOMEN (147, p. 586), for a collection of shirts of good shape, and very firmly worked. Exhibited by a benevolent lady.

VALTAT and ROUILLE, 70 Rue de Ramboteau, Paris (709, France, p. 1213), for a quantity of good shirts, well made, and very cheap.

WHEELER and ANLETT, 23A Regent Street (22, p. 578), for a shirt, elaborately embroidered, and very well made.

*Corsets.*

On reviewing the articles of corsets, as produced by the Exhibitors, the Jurors and Assistant Jurors conversant with the trade, after carefully examining every case, find but few specimens in which there is novelty combined with useful improvement: there are several combinations of anatomical bandages, or supports, with the corset, as an article of dress; with these exceptions, it does not appear that any very great advance has been made in the higher class of corsets beyond the attention which is unceasingly given to an article of such universal and fashionable use. In the instances before alluded to, the improvements have been pointed out. In the general trade, within the last four or five years, the make and shape of these articles have been greatly improved, so that there can now be obtained by all classes, a well-formed and good corset at a very moderate price: a large quantity are now woven by machinery.

The Jury award the Prize Medals to the following Exhibitors:

JOLY, Madames, SISTERS, 45 Rue Neuve St. Augustin, Paris (892, France, p. 1222), for a corset of very novel description; elegant and useful.

JOSELIN, J. J. (551, France, p. 1204), for corsets.

ROBERT WERLEY, and Co., Bar le Duc, Meuse (1164, France, p. 1245), for corsets of excellent manufacture and unexceptionable shape.

VAN BENEDEN-BROERS, Brussels (345, Belgium, p. 1162), for stays of good description, without seams and of excellent workmanship.

The Jury make Honourable Mention of the following Exhibitors in this Department:—

BERGENT, Madame, Brussels (349, Belgium, p. 1162), for a variety of excellent stays.

PIPER, T. F., 4 Bishopsgate Street Without (41, p. 579), for the hygienic child's corset; of novelty and great advantage.

SMITH, Mrs. CHARLOTTE, Bedford (119, p. 584), for a corset of construction.

SOULS, HYPOLITE, Madame, Paris (1492, France, p. 1218), for corsets of good make.

*Straw Plait and Bonnets.*

Though the manufacture of straw-plait and bonnets in England may be considered of recent date, its origin being about one hundred years ago, it has now arrived at a state of great perfection in all its varied branches: this may in a measure be accounted for by the circumstance of the whole female population wearing bonnets; which, with the exception of North America, are but partially used in other countries. At the present moment, it is calculated that from 60,000 to 70,000 persons are engaged in the production of this article; and it is considered that the yearly return cannot be less than from 800,000*l.* to 900,000*l.* With regard to straw goods of foreign manufacture, we have to mention, as most prominent, those of Tuscany and Switzerland. The Leghorn hats, formerly in so much demand, are now but very partially worn, and the same remark may also be applied to the Tuscan plait, which, at the present time, is not adopted in fashionable wear. The Swiss fancy straw-plaits and trimmings occupy a prominent place in this branch of industry, are of great importance to the localities where they are produced, and great taste is displayed in their design and execution, so as fully to meet the constant demands of fashion. Germany and Lombardy have also a limited share in the straw manufacture, of whose production a few specimens are exhibited. We regret to be unable, from want of sufficient data, to state the extent of the amount of the annual returns, or of the employment furnished by the foreign branches of this trade.

The Jury award Prize Medals to the following Exhibitors in this department:—

ART BROTHERS, and other exhibitors (227, Switzerland, p. 1281), for straw plait.

ALLEN, JAMES, and Co., 158 Cheapside (13, p. 677), for ladies' and children's straw hats and bonnets, principally of British materials, some of which are very good.

GREGORY, CURTIS, and Co., 15, Aldermanbury (8, pp. 576-7), for an assortment of hats and bonnets, with specimens of various kinds of straw and plaits, forming an interesting exhibition of this branch of industry.

LONG, GEORGE, of Loudwater, Bucks (16, p. 578), for hats and bonnets made on the pillow-lace principle.

MUIRS, CONNELL, and BRODIE, Luton, Bedfordshire (173, p. 587, and 215, p. 589), for bonnets made from rye-straw, grown in the Orkney Islands, in imitation of the Tuscan plait.

NANNUCCI, Florence (81, Tuscany, p. 1297), for a case of very fine Leghorn hats and capotes of good workmanship.

SULZERBERGER and AKERMANN, Meisterschwanden, Switzerland (234, p. 1281), for a variety of Swiss straw plaits and trimmings of good kind, exhibited in fix glass cases.

VYSE and SONS, 76 Wood Street (11, p. 577), for a case of bonnets of various sorts, in good taste and well manufactured.

VYSE and SONS, Prato, Florence (79, Tuscany, p. 1297), for a selection of very fine Leghorn hats and capotes.

WELCH and SONS, 44 Gutter Lane, London (12, p. 577), for a case of hats and bonnets, made of foreign and English materials, of good style and manufacture.

WOULER and Co., Canton of Argovie (227, Switzerland, p. 1281), for a large assortment of Swiss straw-plait and trimmings, of all descriptions; together with articles showing great skill in this branch of industry.

The Jury make Honourable Mention of the following Exhibitors in this department:—

CLARAZ, A., Fribourg, Switzerland (228, p. 1281), for a variety of straw-plaits, hats, and bonnets, illustrating the peculiar description of industry of this canton. (Prize Medal awarded in Class XXVIII.)

DEPIERRE BROTHERS, Heiden, Canton of Appenzell (189, Switzerland, p. 1278), for embroidered straw bonnets, got up with great taste.

MILWARD, JAMES, and SONS, New York (93, United States, p. 1439), for bonnets made of cotton-braid; commendable for being a new application of this material.

Various articles of foreign manufacture, not easily classed with the European goods, have been considered by the Jury in reference to the producing countries.

*TUNIS.*

Magnificent dresses for Turkish ladies (page 1414), of rich silks finely embroidered in gold and silver; dresses for gentlemen, and also richly-embroidered woollen dresses woven in one piece. The strength of thread fabrics, and the excellence of the weaving, entitle them to notice as highly-interesting specimens of woollen manufacture.

The Jury make Honourable Mention of the following articles exhibited in this department:—

(41, Tunis, p. 1414), silk wrought as a separate article, of great substance and beauty, highly remarkable; and the woollen bernous for common wear, and that for the higher classes, are both very excellent.

(48, Tunis, p. 1414), for dresses of the country, in cotton and silk; also dresses in woollen and mixed materials, exhibiting great strength and excellency in the weaving.

(10, Tunis, p. 1413), for various articles of dress, fez caps, and nunny slawls made of worsted, and other materials, very strong and durable, and colours remarkably good.

(12, Tunis, p. 1413), for a variety of slippers adapted for use in that country, and some richly-embroidered boots.

*TURKEY.*

The admirable examples of costumes, collected by order of the Turkish Government, and exhibited by His Highness the Sultan, were found worthy of the highest commendation by the Jury; but unfortunately, from the system adopted in the collection of these examples by traders, from the dwellings of the poor in the more useful domestic articles, and the harems of the wealthy in those

of fancy embroidery, such as slippers, veils, &c., it is impossible to recognise, either by Medal or Honourable Mention, many of those to whom such distinctions are justly due, as no names are given whereby the Jury can take cognizance of the articles. Those cases which the Jury have been enabled to recognise are selected as much from the facility for giving such recognition as for the high merit displayed in the production, inasmuch as there are others deserving of the same consideration, could the Jury have discriminated amid the vast collection of articles.

The embroidery and fashion of the costumes are of the highest, class, and extremely costly. These dresses, although the costume of the country, are very suggestive; the style of the embroidery is of the highest order—an art which appears peculiar to the country: the slippers also are very elaborately wrought; the veils are richly ornamented with gold and pearls, several of them valued at 25*l.* each.

The various articles of ladies' attire in silk are very richly embroidered; crasse dresses, embroidered scarfs of the most exquisite description, not only as regards the material, but also the design and the combination of colours with the arrangements and disposition of the various materials employed; rendering many of these specimens of the utmost value to our manufacturers.

Many articles of dress from Damascus are not only for the higher, but for the industrious classes; and when it is remembered that many of these are the domestic production of the people, and made in their own cottages, too much praise cannot be bestowed on the skill, elegance, great usefulness, and durability of the goods exhibited.

The hosiery is of various kinds, the household produce of the Angora women. Some of the socks are as high as 10*s.* per pair, while the commoner ones, for the working-people, are produced at exceedingly low prices.

Prize Medals have been awarded to—

HIS HIGHNESS THE SULTAN OF TURKEY, for the collection (p. 1436).

FERUVELADGI, The (Tailors' Association) of Janina (408 to 413 in the Turkish Catalogue, p. 1390), for Albanian costumes, male and female, of rich effect and excellent workmanship.

SOFIALIOGLOU'S DAUGHTER, Constantinople (874, 875, 876, in the Turkish Catalogue, p. 1393), for veils, embroidered in gold and pearls, with silver fringes.

*London, July 1851.*

The Jury make Honourable Mention of the following persons, whose works are exhibited in the Turkish Department:—

BURUDGY (THE GIRL), Constantinople (988, 989, Turkish Catalogue, p. 1394), for embroidered slippers, called ship-ship and flar.

CARAHET'S WIFE, Constantinople (991, 995, Turkish Catalogue, p. 1394), for embroidered slippers.

ISTCHE (THE GIRL), Constantinople (98, Turkish Catalogue, p. 1394), for embroidered slippers, called flar.

TERZY'S WIFE, Constantinople (986, 994, 996, Turkish Catalogue, p. 994), for embroidered slippers, called ship-ship.

#### GREECE.

Greek dresses are exhibited in blue and silver; also red and gold dresses from different islands, of very good work, and elegant patterns.

#### INDIA.

The Jury desire to recognise the articles exhibited in this division. These consist of cloth of real cashmere wool, extremely light, thin, and fine; various dresses exhibiting the Indian costume, in gold tissue and embroidered. There are also articles of dress from Cashmere, richly embroidered in needlework; and muslin, the produce of the country. The silks are stated to wash perfectly well. Acknowledgment is due to the HONOURABLE EAST INDIA COMPANY (p. 857), for this contribution.

#### CANADA.

The Jury desire to make Honourable Mention of—

ADAMS, W. H. F., Montreal (331, Canada, p. 968), for cloth made in Canada; his own production.

BARREAU, J., Quebec (Canada, 110, p. 965), for boots made of deer skins, very excellent in quality, cheap, and waterproof.

#### CHINA.

Honourable Mention is due to the Exhibitor of the magnificent dresses for the higher classes of Chinese, in silk, very richly embroidered (28, p. 1424).

The Jury desire to record their opinion, that if Council Medals are awarded in similar cases, then they are eminently due to HIS HIGHNESS THE SULTAN OF TURKEY (p. 1385), and HIS HIGHNESS THE BEY OF TUNIS (p. 1412), for the valuable contributions which they have made to the Exhibition.

T. CHRISTY, REPORTER.

## CLASS XXI.

### REPORT ON CUTLERY AND EDGE-TOOLS.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

#### Jury.

Right Hon. Lord WHARNCLIFFE, *Chairman and Reporter*, 28 Lower Brook Street.  
 JOSEPH B. DURHAM, *Deputy Chairman*, 456 Oxford Street; *Cutler*.  
 C. KARMARSCHE, \*Zollverein; *Director of the Polytechnic Institution*.  
 NUBAR BEY, *Egypt*.  
 ALDERMAN CHARLES PEACE, \*Sheffield; *late Cutlery and Edge Tool Manufacturer*.  
 J. LE PLAY, *France*; *Engineer-in-Chief of Mining School, and Professor of Metallurgy, Paris*.

#### Associates.

THOMAS DE LA RUE, 110 Bunhill Row; *Ornamental Stationery Manufacturer*. (Juror in Class XVII).  
 THOMAS HETHINGTON HENRY, F.R.S., 18 Lincoln's Inn; *Analytical Chemist*.  
 JAMES RAGG, *Sheffield*; *Scissor Manufacturer*.  
 C. VENABLES, Plomer Hill House, High Wycombe; *Paper Manufacturer*. (Juror in Class XVII).

\* Dr. SCHAFHAÜTL; *Professor of Metallurgy*. (Proxy for M. Karmarsch).

THE Jury for Class XXI. think it desirable to preface their Report by some remarks on the extent and general characteristics of the Class submitted to their judgment, and to offer such general comment and analysis as may serve in some degree to present a connected view of the information therein conveyed, with respect to the progress and position of this species of industry among the countries whose contributions compose it.

There is one point upon which an explanation should be given at the outset. Two important sections of those articles which would ordinarily be comprehended under the designation of "Cutlery," are not here included—those of *surgical instruments* and of *weapons of war*. The objects therefore referred to this Jury consist of such as are designed either for common and domestic use, or for various manufacturing operations.

It appears, according to the information laid before the Jury, that there are altogether about 368 Exhibitors in this Class, distributed, very unequally, among twenty-two of the geographical divisions contained in the Official Catalogue. The United Kingdom, as was to be expected, has furnished a proportion amounting to not less than 45 per cent. of the whole list; and among these are to be found many contributors, on so extensive and varied a scale, that its share in the total display of these articles is much larger than the above numbers would imply. The second place is occupied by Austria, whose Exhibitors constitute 27 per cent. of the entire sum. After her the Zollverein States of Germany, furnishing about 8 per cent.—France about 3 per cent.—Sweden and Norway in nearly the same proportion. A very small number of Exhibitors from the remaining countries complete the list, though some of these national collections, however confined to few individuals, contain objects well worthy of attention.

These results must not be taken as any certain indication of the comparative proficiency of the respective countries in the production of commodities of this kind, or of the value of their contributions. It is probable that in some degree they may show the character and nature of the manufacture as carried on in these different states, and correspond with its subdivision among more or less numerous hands in comparison with its total extent. In Austria, for instance, we find by the Catalogue that the collections specified as assignable to each Exhibitor consist for the most part of one kind of manufactured article, scarcely any of more than two or three; and we may therefore perhaps venture to infer that the high number of these, as compared with some departments where they

are individually more comprehensive, arises from a very different distribution of capital among their separate establishments in this branch of industry.

But this is not to be considered as a disparagement to their contributions. Such a condition of the manufacture may be best adapted to the supply of the particular demand for which it exists; and, as regards the present occasion, even apart from such considerations, the appearance of a numerous list of exhibitors from any one country may be reasonably taken as a gratifying evidence of the interest and activity awakened there by the invitation to co-operate in a display of the works of universal industry, and of an active desire to share in its honours.

The characteristics of the different national collections are, however, interesting in more than one point of view. We may detect in various instances indications of the peculiar condition and habits of the people whence they come, of their social and industrial wants and aims, as well as of their natural or acquired advantages.

In England the close proximity of coal and iron, together with abundant facilities for converting the latter into steel, gave, at an early epoch, to this branch of its manufactures remarkable energy and importance. Its steel wares had a wide-spread reputation even in the middle ages. The authority of Chaucer assures us that in the fourteenth century the "Sheffield whittle" was an article of choice estimation; and, within their respective spheres, the blades of Toledo and Damascus were scarcely more valued than the more homely cutlery of England. This pre-eminence the Jury can have no hesitation in pronouncing that she still retains to a very remarkable degree in the present Exhibition; though the general statement must now admit of modification, and it would be untrue and unfair to make it without adding, that she has in certain branches of the manufacture some formidable rivals. Still, the long-established trade of this country in steel goods of every description, and her ancient practice of forging them for the supply of all markets, are shown in the great variety as well as excellence of her contributions, which comprise specimens of almost every conceivable article of this description. But in other countries, where the manufacture has been of more recent growth, it is evident that the energies of their artisans have been directed, by a natural consequence, to the production of those particular article more especially called for by their individual position or exigencies. One of the chief objects of the German Customs Union, for instance, has been to encourage the supply from their own workshops of those commodities

of general and ordinary use, which were formerly in great part derived from importation. From the Zollverein States, accordingly, we find a mixed collection of that character, consisting mainly of common cutlery and simple tools, together with some few objects of the plainer kind for certain foreign markets. From Austria, where the mines and manufactures are in the immediate neighbourhood of a large agricultural and pastoral population, it is to be observed that the collection consists largely of scythes, sickles, and the simpler implements of husbandry. In Switzerland the traditional manufacture of fine watch-work renders delicate files a matter of primary necessity, and there is therefore a predominance of these among the better articles in this department. The Belgian collection is distinguished by "spiral cutters" of superior quality, required in the finishing of the woollen fabrics for which that country has long been famous. In France we of course find a very miscellaneous collection; but it displays in a marked manner productions indicating, on the one hand, the highest scale of social civilization and of manufacturing skill in certain spheres and localities, and, on the other, the simplest wants of a primitive provincial population; while in the United States and Canada, where the occupation of the population is an incessant war upon the forest, the manufacture of axes and woodmen's implements assumes an importance which has raised them to the highest perfection, and renders this class the most perfect part of the transatlantic exhibition. But it appears advisable to add some more precise notices of the peculiar contents of each national collection; and for this purpose it will be most convenient to take the two great divisions in the order adopted in the Official Catalogue.

First, then, with respect to the United Kingdom, we find that articles in the Class of Cutlery and Edge-tools have been sent from a great variety of places. In England, from London, Sheffield, Birmingham, Warrington, Stourbridge, and a few other towns of less note; from Glasgow and Edinburgh, but chiefly from the former, in Scotland; and from Cork, Clonmel, and Limerick, in Ireland. Among these seats of the manufacture there is none, as might naturally be expected, which for extent, variety, and excellence of collection, can compare with Sheffield,—its most ancient home. We here find every article, from the most exquisite razor down to the plainest pocket-knife, and from the finest saw or file to the most ordinary chisel, displayed, with various degrees of merit it is true, but with a large proportion of the highest. From this collection, the Jury have thought themselves justified in awarding for one remarkable object a Council Medal. Messrs. SPEAR and JACKSON (123, Class XXII., p. 606) have exhibited, among an assortment of edge-tools of great excellence, a cast-steel circular saw, of the large size of 5 feet diameter, and of such equal beauty and perfection that it stands far above comparison with any other in the Building. The mere excellence of its quality and workmanship, however, would not, the Jury are aware, have enabled them to distinguish it by a Council Medal, if they had not been able to satisfy themselves that its merit is the result of a new and peculiar process of manufacture. But they entertain no doubt, from the information they have received, that mechanical ingenuity of a novel and special character has been employed by these manufacturers for the production of such articles, without which they could not be carried to equal perfection; and they therefore consider them justly entitled to the highest mark of distinction.

There are two other contributions to which the Jury would have felt themselves called upon to award a similar honour, if they had been at liberty to regard singular excellence of workmanship and quality as of itself a sufficient title. Messrs. TURTON and Sons, of Sheffield (190, p. 614), and Messrs. STUBBS, of Warrington, (39, p. 392), each display a complete assortment of files of various sizes,—the former, for ordinary manufacturing purposes, the latter, for the finer operations of the watch-maker,—which, the one for large dimensions, and the other for minute delicacy, combined with the utmost strength and efficiency of material, far surpass any other objects of the same class. They would have deserved

the highest assignable reward in respect of these points of merit. Prize Medals, however, have been awarded to them, in common with a number of associates not unworthy of their company. It will be found that the list of these contains a series of names of which many are of high note in the estimation of the public, and whose contributions—some extensive, and comprising in a high degree almost every variety of excellence, others limited, but of marked merit throughout—display the choicest productions in the most finished cutlery, and the finest mechanical tools.

The attention of the Jury was particularly called to one novelty exhibited by Messrs. BLAKE and PARKIN, of Sheffield, (193, p. 614-15), consisting of the union of two qualities of cast steel, hard and soft, in the same article; having carefully examined these specimens, which were manufactured with much skill, they have no reason to doubt that the process is peculiar to the Exhibitors; but they cannot satisfy themselves that it involves any clear advantage over the combinations of cast and bar steel, and of cast steel and iron, the methods of cementing which have been long known and practised.

The contribution from London is of course on a more limited scale than that from Sheffield; but it consists of that superior order of cutlery for which the Metropolis has a long-established reputation, and contains articles of high merit in this Class. Among the Exhibitors from London, Mr. DURHAM, of Oxford Street, (46, p. 593), would have been considered by his colleagues deserving of a Prize Medal, if his consent to act as a Juror had not disqualified him from accepting it.

The finer descriptions of cutlery are nearly confined, in England, to the Sheffield and London departments; but there are a few articles contributed by individual manufacturers from other places, whose names will be found in the Award List; and there are some also furnished from Ireland and Scotland, which, though not equal to the best from the chief seats of the manufacture, are still of considerable excellence.

Manufacturing tools are supplied largely from Birmingham, and sparingly from Scotland; scythes and files from Stourbridge and Warrington; which latter place furnishes the beautiful collection of watch-files by Messrs. STUBBS, already mentioned.

On the whole it appears that the British manufacture of cutlery remains still, as heretofore, mainly seated at Sheffield, though it has been established also to a limited extent in some other quarters. The same gradual change of circumstances which has operated to transfer, in a great degree, the silk and some other trades from London to the provinces, has had the effect of withdrawing much of this branch of industry from the capital; though a portion, chiefly directed to the production of the higher order of articles, still retains its footing there, and sustains its reputation. On the other hand, the manufacture of the coarser goods, such as tools and mechanical implements, is now extensively shared by several localities which afford the requisite facilities for its successful prosecution, and where the various other forms of industry which surround it create a continued demand for its productions.

Extending our survey beyond the limits of the United Kingdom, from its provinces to its dependencies, it will be found that these present aspects so very different, that certain distinctions are indispensable, with reference to a proper estimate of their position as exhibitors.

It is not to be expected that in infant communities, such as most of the Colonies, properly so called, a manufacture of this kind could have attained any considerable growth or perfection; though the greater progress and development of some few have enabled them to meet their peculiar local exigencies with considerable success. We find in this category a small contribution from the Cape of Good Hope, by the Missionary Station at Gnathendal, consisting of various forms of knives adapted to the uses of that country; and from Nova Scotia another, of cutlery made of Nova Scotia steel, though manufactured in Sheffield: both are creditable to these colonies. While from Canada (West) there is a larger assortment, consisting entirely of axes and tools,

the former especially of excellent quality, and proving the skill and power of her artisans to supply those particular articles to which her physical exigencies give the highest importance.

On the other hand, there are contributions from dependencies which are to be considered in a very different light, not newly-peopled, but ancient communities, variously advanced in civilization, and having their own established and characteristic industrial pursuits, often of the highest order of manual dexterity. In this division there are some from the vast territories of the East India Company, which well deserve notice; and a small contribution from Jersey. The Indian department contains various Hindoo and Malay tools for the use of carpenters and workers in metals; and among them are found, from Moorshedabad, in Bengal, a set of the implements employed by the native artificers in carving the beautiful ivory articles which have so long been admired in the western world, and which present such rare examples of ingenuity, taste, and skill.

Articles of this kind, however, are of so peculiar a nature, and of so limited an application, that they can scarcely be considered as bringing into play any principle of general competition or comparison. It is not so with the foreign neighbours of Great Britain, whose productions come next under notice. They will be found to extend, with various degrees of excellence, through all the class of commodities which proceed from the workshops of the United Kingdom, and to include some, also, of a peculiar and distinctive character.

Looking first to Europe, its foreign exhibitors may be classed under certain great subdivisions, which are naturally suggested by the position and relations of its different members, and may conduce to the clearness and convenience of the survey. Thus the several national departments, contained in the total list, may be advantageously connected as follows:—

1. France, Belgium, and Switzerland;
2. Austria, and the Southern States of Germany;
3. The Zollverein, and Northern States;
4. Denmark, Sweden, and Norway;
5. Russia;
6. Spain and Portugal;
- and finally,
7. Turkey, Egypt, and Tunis;
8. China; and
9. The United States of America, will complete the distribution over the remainder of the world.

1. From France there is an extensive assortment, ranging from the finest ornamental cutlery down to the rudest and cheapest articles for domestic use, which in general character is very good, and in some instances of superior quality. The greater portion appears to be supplied from Paris; but there are a few exhibitors also from the provinces—from Moulins (an ancient seat of this manufacture), from St. Etienne, and from places in the districts bordering on the Rhine.

In cutlery, the best specimens are those of razors, pen-knives, scissors, and table-knives, many of which are very highly finished and elaborately ornamented, and display great skill as well as superior quality. Among the tools and implements are to be found a very excellent circular saw, showing high proficiency in this branch of the manufacture; and assortments of files, also of considerable merit as to workmanship, though found, after a careful trial, to be not quite perfect as to the quality of the steel. On the other hand, they mention particularly the samples of “web-saws,” which are of the very highest class, and, indeed, superior to anything of the same description contained in the English collection.

Belgium supplies cutlery, together with files, scythes, “ledger blades,” and “spiral cutters.” These last articles are portions of the machinery used in the dressing of cloth, and are of a high degree of merit. The cutlery, principally of the table kind, is well finished, but the metal is somewhat soft, and unequal to the workmanship. The same must be said of the scythes and files.

From Switzerland, the articles consist mainly of razors,

and of small files adapted to the use of the watchmaker. The former are of fair quality; the latter of the most delicate workmanship, and well suited to the trade for which they are designed, and which has been long successfully pursued in that country.

The attention of the Jury was called, in the French department, to a collection of articles, as examples of remarkable cheapness, which they would not have deemed worthy of mention on any other grounds. These are a certain description of extremely rude pocket-knife, said to be in very universal use among the peasantry of France, for cutting their provisions, and other purposes. They are formed of a rough blade of soft iron, folding into an equally rough turned cylindrical handle of wood. It is obvious that, with such materials, their utility must be very limited; but they are sold for *five centimes*, or about *one halfpenny*, each, and are therefore in general use among the poorer classes.

In France, Belgium, and Switzerland, the manufacture of cutlery and edge-tools has greatly improved, and seems likely to continue to do so.

2. Of the subdivision of States which we have placed next in order, the same improvement may, to a considerable extent, be observed. If we include therein Austria, Wurtemberg, and Saxony, we find that the two latter, at least, exhibit specimens of general knife cutlery, and of hunting-knives, which, though they cannot be pronounced equal to the best English, are of very good quality, we finished (especially in the Saxon portion), and mounted with much costly ornament. From Austria the display is not of so high a class; the cutlery from that country is of a very ordinary description, chiefly the produce of Styria, and is stated to be exhibited, in a great measure, as an example of cheapness. After such consideration, however, as the Jury have had the means of giving to this point, they conclude that the price is not below what goods of the same quality might be produced for in other countries. The articles are very deficient in merit of any other kind, many of them not even being of steel.

These remarks apply in a great measure to the tools and implements in this department. There are some from Wurtemberg of fair quality; but the assortments of files and other such objects from Austria are indifferent, and not, apparently, very low in price. There is here, however, one description of article deserving of notice, as a curious example of the modification which all tests of merit must undergo when judged by the peculiar uses for which the production is designed. There are from the southern provinces of Austria assortments of scythes, worked thin, and with a concave surface, very difficult to forge, and therefore requiring much skill in the workmanship, but of metal so soft and inferior, that they would not have been considered worthy of any notice were it not that they are so made purposely to suit the particular habits of an agricultural population, who mow all crops, whether of grain or others, close to the surface of a soil generally abounding in stones. A scythe of hard steel, with a fine edge, though it might perform its work better where unimpeded, would be liable to constant injury, very difficult of repair, under such circumstances; whereas these Tyrolese or Styrian scythes yield at once to the blows which they receive upon their edge. The labourer carries with him a small hammer; and whenever the blade has so far lost its shape as to need renewal, he beats it out in a few moments to its original form; hence the softness of the metal, in most cases considered wholly inconsistent with excellence in this branch of manufacture, becomes an essential property.

3. From the States of the Zollverein, and from Hamburg and Mecklenburg-Schwerin, in Northern Germany, there is a collection of articles of almost every description. The two latter States contribute only on a limited scale; Mecklenburg some razors, and Hamburg also, together with a small collection of tools, of fair quality. The former commodities are not good of their kind, and those from Mecklenburg apparently very high in price. Of the cutlery from the Zollverein, much, though highly finished, is of an ordinary description, consisting of table and pocket knives in considerable variety; but there are also certain “spear knives,” designed for fishing by the

natives in the South American rivers, and adapted for their markets, which deserve notice as of superior manufacture. Among the tools the same character prevails as in the cutlery, though there are certain "web-saws" which evince higher skill. There is an assortment of scissors, chiefly from Solingen in West Prussia, worthy of attention as being manufactured in great numbers from an ore producing a "natural steel," which is of such quality as to suffice for the purpose to which it is here applied, and to save the manufacturer the cost and labour of the converting process, thereby enabling him to produce such goods at a price much lower than would be profitable with the ordinary methods. The workmanship of these scissors appears to be fair; but the Jury were unable, after much attention to the point, assisted by the judgment of Mr. Ragg, an experienced workman, to satisfy themselves entirely as to the real quality of the metal, although the material from which they are said to be manufactured has been examined by Mr. Henry, and was pronounced by him to be steel.

4. The collection from Denmark, Sweden, and Norway are small, and contain little that requires notice. From the two latter countries the number of exhibitors bears a large proportion to the extent of the contributions, indicating establishments on a very limited scale; and although Sweden has long produced the most valuable iron, as the raw material of the finest steel and of the most finished cutlery, it does not appear that the manufacture itself has made any great advance. The collection consists of some razors, spring-knives, and other cutlery tools of an ordinary kind. From Denmark there is one singular article, a set of files, hollowed, and made to fit within each other: they are curious, and difficult of manufacture, but of no apparent utility.

5. Of the three contributions from Russia, one only is from a private individual, the other two are from imperial establishments. The former contributes a varied assortment of cutlery of all kinds, and of fair quality; the latter some tools, which cannot be ranked very high, and some scythes of the same kind as those whose peculiarities were described in the Austrian Department. The Russian implements of this description are the best.

6. From Spain and Portugal the contributions are very small. The former exhibits only an assortment of files from Placencia, of very fair quality: the latter, some "agricultural implements," consisting of pruning-knives and scissors, probably adapted to the vine cultivation, but of little merit as manufactured goods.

7. Of the three States in the next division, Turkey, Egypt, and Tunis, the two latter are only slender contributors in this Class. One or two articles contained in the list furnished by the Egyptian Government, and a few pairs of Tunisian scissors of the roughest workmanship, constitute the entire collections. Turkey, however, appears with articles of greater interest, such as scissors and hunting-knives; few in number, but well made. The knives have blades of Damascus steel; the scissors are of a singular form, and well deserve notice. They are so fashioned that each blade is half of a hollow cone, and

the two therefore produce an entire cone when closed. The sides of each of these halves form the cutting edges. They are well finished, and must have required much skill and great labour in their fabrication, rendering their cost high; but it does not appear that they possess any superior utility. It is not stated that they are so made for any special purpose; and if not, they involve considerable waste of toil and skill.

8. From China there are only a very few articles; but one of them is a singular instrument, and should be noticed, as characteristic of the people from whose workshops it proceeds. It is a small blade of a triangular form,  $2\frac{1}{2}$  inches long,  $1\frac{1}{4}$  inches wide, and  $\frac{1}{4}$  inch thick, folding upon a slender wooden cylindrical handle, and is used as a razor for shaving a part of the head, according to general practice among the Chinese. It is not easy for us to comprehend how the operation can be successfully performed with such an implement; but it is said to be in common use among the natives, and to effect its purpose in their hands with the utmost nicety and despatch, and it cannot, therefore, be ill-adapted to its object. The workmanship is, to European eyes, of a very rude description, and even the surface of the metal displays none of the finish which is so diligently bestowed on many Chinese productions; but the edge it carries is certainly good, and its quality, no doubt, surpasses its appearance.

9. Lastly, the opposite hemisphere supplies, from the United States of America, a collection which, though not very extensive, contains some signal proofs of proficiency in such manufactures, and is strongly characteristic of the natural and social exigencies of the people from whom it comes. It consists of a few articles of the finer cutlery, but mainly of assortments of the larger edge-tools and implements, such as scythes and axes, and other objects of that nature. The former are finished with great care, and decorated with much costly ornament; but the Jury cannot pronounce them to be of the first degree of excellence in workmanship, and their temper is wanting in the hardness proper to the best cutlery. With respect to the other articles, however, the case is different. There is a set of joiner's tools, which, though few in number, are excellent; and the same may be said of the scythes, which are of the best quality. Good as these productions are, they are perhaps surpassed by the axes, to which nothing of the kind can be superior; they are admirably finished, and at the same time display all those more valuable qualities which are the necessary conditions and evidence of perfection in such commodities. It is evident that the great prevailing want of the population has created and encouraged to perfection, in its own neighbourhood, the trade which was to supply it.

The Jury believe that in the above general survey of the contributions presented by this Class of the Exhibition, they have left nothing unmentioned of any note or merit; and having thus endeavoured to point out the several interesting features which belong to it, it only remains for them to add a list of the awards.

### AWARDS IN CLASS XXI.

#### 1. RECOMMENDATION FOR COUNCIL MEDAL, CONFIRMED BY THE COUNCIL OF CHAIRMEN.

| Nation.        | No. and Page in Catalogue. |       | Name of Exhibitor.            | Objects Rewarded.  |
|----------------|----------------------------|-------|-------------------------------|--|
|                | No.                        | Page. |                               |  |
| United Kingdom | 113                        | 608   | Spear and Jackson (Cl. XXII.) | For exhibition of circular saws, particularly one 60 inches in diameter, of marked and very superior excellence, manufactured by a process of peculiar merit, the result of a novel application of mechanical ingenuity recently effected by themselves. |

## 2. AWARD OF PRIZE MEDALS.

| Nation.         | No. and Page in Catalogue. |       | Name of Exhibitor.                    | Objects Rewarded.                                      |
|-----------------|----------------------------|-------|---------------------------------------|--|
|                 | No.                        | Page. |                                       |  |
| United Kingdom  | 23                         | 591   | Addis, J. B., jun.                    | Carving-tools.   |
| France          | 753                        | 1216  | Arnheiter, M.                         | Cutlery.   |
| United Kingdom  | 193                        | 614   | Blake and Parkin (Cl. XXII.)          | Saws and files.  |
| United Kingdom  | 110A                       | 606   | Brookes, W., and Son (Cl. XXII.)      | Edge-tools.  |
| United States   | 259                        | 1452  | Brown and Wells                       | Tools.   |
| United Kingdom  | 18                         | 591   | Buck, J.                              | Turning and other tools.                               |
| United Kingdom  | 192                        | 614   | Butcher, W. and S. (Cl. XXII.)        | Edge-tools and razors.                                 |
| United Kingdom  | 240                        | 619   | Butterley, Richard (Cl. XXII.)        | Sickles.   |
| United Kingdom  | 115                        | 606   | Cocker and Sons (Cl. XXII.)           | Files and edge-tools.                                  |
| France          | 129                        | 1177  | Coulaux and Co.                       | Saws.  |
| Wurtemberg      | 57                         | 1117  | Dittmar, Brothers                     | Cutlery.   |

\* Awarded a Prize Medal in Class VI.

3. The Jury, however, scarcely feel that they should be doing complete justice to the spirit and exertions of some other exhibitors if they did not mention, that though their contributions have not appeared to be of quite such a character as to entitle them to the distinction of a Medal, they are still deserving of HONOURABLE MENTION; and they therefore desire to append the following list of names to which such special recognition is fairly due.

| Nation.        | No. and Page in Catalogue. |       | Name of Exhibitor.                | Objects Rewarded.          |

## CLASS XXII.

### REPORT ON IRON AND GENERAL HARDWARE.

- \* The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

#### *Jury.*

- HON. HORACE GREELLY, *Chairman*, United States; Editor.  
 W. BIRD, *Deputy Chairman*, 5 Martin's Lane, Cannon Street, City; Iron Merchant.  
 ARTHUR ADAMS, Walsall; Hardware Merchant.  
 — AUER, Austria.  
 W. DYCE, R.A., *Reporter*, 2 Fitzroy Square.  
 G. GOLDFENBERG, France; Manufacturer; Member of Central Jury, &c.  
 DON MANUEL HEREDIA, Spain; Merchant.  
 F. STIRLING HOWARD, Sheffield; Sheffield Plate Manufacturer.  
 GEORGE SHAW, Cannon Street, Birmingham; Patent Agent.  
 FERD. SPITAELE, Belgium; Member of Senate, Vice-President of Chamber of Commerce, Charleroi.  
 DR. F. STEINBEIS, Zollverein; Member of the Board of Trade and Commerce.  
 HENRY VAN WART, Birmingham; Merchant.

#### *Associates.*

- SIR H. R. H. BISHOP, 13 Cambridge Street, Hyde Park; Professor of Music at Oxford. (Juror in Class XA.)  
 WARREN DE LA RUE, Ph. D., F.R.S., F.R.A.S., F.C.S., 7 St. Mary's Road, Canonbury, Islington; Manufacturer of Ornamental Stationery. (Juror in Class XXIX.)  
 A. W. HOFFMAN, Ph. D., F.R.S., F.C.S., Zollverein; College of Chemistry, Oxford Street; Professor of Chemistry. (Juror in Class XXIX.)

THE range of Class XXII. may be said to be co-extensive with the employment of the baser metals in manufacture. In that respect it forms a *nucleus* round which, either wholly, or in certain particulars, various other classes, to the number of seven or eight, are distributed; and which are separated from it on grounds, partly of convenience, and partly of the subjection of metal-working, as such, to the purposes of specific branches of industry or science.

Owing, however, to the difficulty, in many cases, of making such a separation, the range of Class XXII. has been limited rather with respect to the number of objects embraced by it, than to their nature; among which, in point of fact, there are included examples either analogous to, or identical in all essential particulars with, a considerable portion of those exhibited in Classes I., V., VI., VIII., IX., X., XXI., XXIX., and XXX. Thus, for example, although it belongs to Class I. to determine the merits of iron, steel, copper, or other wire, under the head of "Metals in their progress to finished manufactures," the same wire, when twisted or woven, comes under Class XXII., in which its merits, with this new quality superadded, must again be tested by a rule involving a judgment on the material itself. Then again, Class XXII. abounds, if not with machines, at least with machine-like contrivances, and with implements and tools, which identify it with several of the Classes above enumerated. In the case of metallic sculpture, this identity with Class XXX. is especially to be remarked. As a general rule, it was thought that the Jury of Class XXII. might with advantage confine themselves to the consideration of art as it is applied to ornamental purposes; but practically it was by no means easy, if indeed it was possible, to define in every respect the limits between ornamental art and fine art; and besides, it was to be borne in mind, that statues in metal, and other similar works of art, while they are to be judged of æsthetically, are also, as the result of various metallurgic operations, amenable to the criticism of the founder and metal-worker, and may have, in that respect (as the Jury believe to be the case in more than one instance in the Exhibition) a merit, which, though not independent of artistic

excellence, is nevertheless separable from it. On this ground, nearly the whole of the sculptures in metal have passed under the review of this Jury; and they would remark, with respect to this and other cases, that although their duties would have been lightened by a more exact definition of the limits of their Class, and, in all instances in which it was practicable, by a statement of the particular merit on which the exhibitor wished to found his claim to reward, yet the exhibitors of those articles which have undergone the scrutiny of more than one Jury, will have no reason to complain of an arrangement, which, at the least, must have tended to enlarge the grounds of criticism, and make more fully known their claims to notice.

The objects included in Class XXII., considered with reference to material, range themselves for the most part under the heads of:—

1. Brass Manufacture.
2. Copper, Zinc, Tin, Pewter, and General Brazier.
3. Iron-work.
4. Steel Manufactures.

The following particulars being comprehended under these heads:—

#### 1. Brass Manufactures.

- a. Cabinet and general brass foundry: consisting of hinges, fastenings, escutcheons, bell-pulls, brass foundry used in ships, knockers, door-springs, castors, &c.
- b. Plumber's brass foundry: cocks, valves, pumps, water-closets, &c.
- c. Stamped brass: cornices, curtain-bands, finger-plates, &c.
- d. Gas fittings, brackets, chandeliers, pillars, gas-burner and consumers' meters, &c.
- e. Tubing, plain and ornamental.
- f. Metallic bedsteads.
- g. Chandeliers, lamps and candelabra for oil, candles, or camphine, and lamp-chains.
- h. Railway and carriage brass foundry, and signal lamps and lanterns.
- i. Bronze figures, busts, and chimney ornaments.

- k. Bells: house, church, ship, table, &c., and alarums.
- l. Candlesticks: table and bedroom.
- m. Monumental brasses and ecclesiastical brass-work.
- n. Copper-plates for engravers.
- o. Miscellaneous: including pins, nails, wire-gauze, bird-cages, hooks and eyes, wire baskets, and ropes.

### 2. Copper, Zinc, Tin, Pewter, &c.

- a. Kettles, coal-scuttles, coppers, saucepans, steamers, plate-warmers, &c.
- b. Bronzed tea and coffee-urns, kettles, &c.
- c. Tubing: copper, tin, lead, &c.
- d. Pewter, German silver and Britannia metal tea-pots, basins, dishes, spoons, ladles, inkstands, &c.
- e. Coffin furniture: plates, escutcheons, &c.
- f. Zinc articles generally.

### 3. Iron-work.

- a. Stoves, grates, fenders, and fire-irons, kitchen ranges, cooking apparatus, smoke-jacks.
- b. Warming apparatus for halls and rooms, ships, &c., either by water, coal, coke, wood, charcoal, or gas.
- c. Shower, vapour, air, and warm-water baths.
- d. Ventilators: metallic and others.
- e. Pipes and gutters, &c.
- f. Locks and hinges.
- g. General ironmongery.
- h. Ice machines.
- i. Knife-cleaning machines.
- k. Letter-copying machines and presses.
- l. Saddlers' ironmongery.
- m. Hollow ware, cast and wrought, tinned, and enameled.
- n. Spades, shovels, pickaxes, hoes, rakes, garden-rollers, &c.
- o. Nails: cut, cast, and wrought.
- p. Screws and railway bolts, &c.
- q. Iron safes, cash boxes, fire-proof and others.
- r. Horse-shoes.
- s. Gates, railings, hurdles, and stable fittings.
- t. Mangles, washing-machines, &c.
- u. Iron benches, garden seats, &c.
- v. Castings in iron.

### 4. Steel Manufacture.

- a. Tools and heavy steel toys, hammers, vices, &c.
- b. Steel ornaments, light fancy steel toys, brooches, buckles, &c.
- c. Steel pens and metallic pens of other kinds.
- d. Needles, fish-hooks and fishing tackle.

Besides these, there must be included also a number of objects fabricated of mixed materials, such as buttons—metallic, Florentine, pearl, bone, &c.—and other productions coming under the usual denomination of hardware. Considered in another aspect, the articles comprehended in Class XXII. may be divided into those intended to supply the necessary and absolute requirements of large industrial populations, and generally to minister to the conveniences of society; and those which, either partially or wholly, are created to meet the demands of taste and refinement among the wealthier classes of the community.

A large proportion of its contents, accordingly, consists of articles of mere utility and convenience, the merits of which were to be tested by such considerations as fitness for their professed purpose, and excellence of material and workmanship.

To these tests the Jury believe it would have been advantageous to have added a comparison of prices; but they found it necessary to abstain from introducing this element into the grounds of their decisions, partly on account of the difficulty of doing so, and partly in deference to the instructions furnished to them by the Council of Chairmen.

They must also add, that, after much deliberation, they felt themselves compelled to adopt a rule for determining the merits of inventions, and of improvements on existing contrivances, which, in many cases, they admit to have been inadequate. Numerous instances, of course, there were of contrivances in which the adaptation of the

means to the end was so obvious, that no question could be made of it. Others there were in which the actual working of the invention was witnessed; but there was a third class, respecting which the decisions of the Jury, it was felt, must be *pro tanto*, conditional and contingent on the efficacy of the contrivance, unless—and this was considered to be impracticable—they were enabled to form an opinion after actual experiment.

This question was, in the first instance, raised in the case of lamps for oil or camphine, on the occasion of a consultation between this Jury and the Jury of Class XXIX.\* on that point; and it was subsequently decided, in the first place, that there were practical reasons, which it is here unnecessary to state, against undertaking a course of experiments on the comparative advantages in point of economy and the illuminating power of the lamps in question; and, secondly, that supposing it to be otherwise (though indeed the same or similar obstacles existed in other cases), the Jury must, in fairness to exhibitors in all the sections of this Class, have resorted to experiment where any doubt arose, and thus have protracted their labours to an inordinate length.

Among the cases to which the Jury refer, they may advert more particularly to contrivances for preventing smoke, kitchen ranges, professing great economy in fuel and other advantages, apparatus for heating and cooking by gas, and such like.

In some instances, indeed, experiment would have rendered no assistance. In the manufacture of steel pens, for example, the improvements introduced by particular houses (beyond a certain point of excellence long since passed by all) are for the most part, merely differences of form, on the advantages of which, adapted as they are to suit different characters of hand-writing, very few persons would be found to agree. With respect, however, to all the cases to which they refer, the Jury believe that, short of actual experiment, they have neglected no means by which they were likely to arrive at a sound conclusion. And besides, it must not be forgotten, that even in these and similar instances, the invention or contrivance is not the chief, nor always the sole element of merit on which they were called upon to pronounce a judgment.

Next in order to articles of mere utility and convenience, may be ranked those in which use is combined with a greater or less amount of ornament. These constitute the largest proportion of the objects in Class XXII.; besides which there is a third section, which consists of articles either solely or chiefly ornamental; including such works of fine art as are or may be employed for decorative purposes.

The whole number of exhibitors in this Class is upwards of 1,200, including those who, chiefly exhibiting in other Classes, have also sent articles which more or less come under the denomination of hardware. This number also includes exhibitors of certain objects, such as metallic combs for weaving, and mangles, which were ultimately referred to other Juries.

The proportions in which various countries have contributed examples of all kinds may be gathered from the following statement of the relative number of exhibitors:—

Two-thirds of the whole number of contributors belong to the United Kingdom; the other third are thus distributed:—

|                               |   |   |   |   |                      |
|-------------------------------|---|---|---|---|----------------------|
| From France                   | - | - | - | - | about one-fourth.    |
| From States of Zollverein     | - | - | - | - | rather above ditto.  |
| From Austria                  | - | - | - | - | about one-eighth.    |
| From Belgium                  | - | - | - | - | about one-sixteenth. |
| From Canada                   | - | - | - | - | ditto ditto.         |
| From United States of America | - | - | - | - | ditto ditto.         |

And the remainder from India, China, Denmark, Spain, Sweden and Norway, Russia, Switzerland, Jersey and Guernsey.

From the extreme difficulty of classifying so multifarious an assemblage of objects as are included in this department of the Exhibition, on approximation only can

\* See Appendix (A.), page 510.

be made to the proportions in which British and Foreign exhibitors have contributed examples in specific branches of industry; but the following table will, perhaps, suffice to show how the case stands with the more noticeable kinds of manufacture:—

NUMBER OF EXHIBITORS, BRITISH AND FOREIGN, of the principal objects in CLASS XXII.

| Kind of Objects.   | No. of Exhibitors. |          |
|--|--------------------|----------|
|  | British.           | Foreign. |
| Anvils, vices, &c. — — — — —   | 4                  | 3        |
| Baths of all kinds — — — — —   | 16                 | 1        |
| Bedsteads, metallic — — — — —  | 15                 | 7        |
| Bellows, acoustic tubes, &c. — — — — —                                       | 7                  | 3        |
| Bells, church, house, &c. — — — — —  | 8                  | 11       |
| Bird-cages — — — — —   | 6                  | 6        |
| Brass-foundry (various) — — — — —  | 16                 | 6        |
| Bronzes, bronze wares, and castings — — — — —                                | 9                  | 63       |
| Buttons (various kinds) — — — — —  | 20                 | 13       |
| Chandeliers, metallic — — — — —  | 9                  | 6        |
| Copying machines, presses, &c. — — — — —                                     | 18                 | 3        |
| Enamelled and tin ware — — — — —   | 4                  | 4        |
| Filters — — — — —  | 4                  | 1        |
| Gas meters — — — — —   | 12                 |          |
| Gas stoves for cooking, &c., and gas fittings — — — — —                      | 14                 |          |
| Grates, fenders, fire-irons, cooking apparatus, iron castings, &c. — — — — — | 84                 | 25       |
| Kardware (various) — — — — —   | 54                 | 26       |
| Horse-shoes — — — — —  | 10                 | 1        |
| Japanned ware — — — — —  | 6                  | 6        |
| Jews' harps — — — — —  | —                  | 5        |

The foregoing table includes those cases only in which a comparison of the kind proposed may be instituted, or in which the articles exhibited are sufficient in number to merit notice as the basis of such a comparison; but in both the British and Foreign Departments there is, besides, a great variety of articles of a miscellaneous description, such as specific inventions or contrivances; curiosities exhibiting the processes of particular manufactures or the skill of artificers; and, especially in the Foreign Department, examples, which, though unimportant in themselves, are interesting as giving completeness to the picture, which, in conjunction with others, they afford us of the entire character of the industry of particular localities. And with respect to these last, the Jury desire to express their appreciation of the liberal spirit manifested by those among the exhibitors of them, whose sole motive must have been to render the display of their national and local manufactures as complete as possible.

On a general review of the contents of Class XXII., the Jury observe first, that although the contributions from the United Kingdom are twice as great as those from all other countries, and, with trifling exceptions,

consist of examples in all branches of metallic manufactures, the character of the contributions seems to indicate that British hardware manufacture is, at present, chiefly pre-eminent for excellence of workmanship and material, contrivance, ingenuity, mechanical skill, and other qualities, which, *independently of taste*, give value to productions intended to supply the every-day wants and conveniences of life. There seems to be no doubt that in this class of manufactures, in which taste is either not a necessary element or applicable only to a very limited extent, the palm of superiority must be accorded to the United Kingdom. In particular instances there are, of course, exceptions to this rule; but, on the whole, with the advantages of cheap material, superior and powerful machinery, and a commercial demand of such extent as to insure, while it invigorates and directs, the efforts to supply, British hardware of the commoner sort stands unrivalled in its variety, its utility and excellence of workmanship, and in its adaptation to the wants and wishes of every class of purchasers.

In manufactures of a higher order, which involve the application of tasteful design and ornamentation, the merit of British productions, though very unequal, is, on the whole, less pre-eminent. Whatever amount of evidence there may be that the persons who furnish the designs are deficient in artistic education and intelligence, it seems to be almost beyond question that the inferiority of British hardware, in point of taste, is, in many instances, more immediately traceable to other causes. One of the chief of these the Jury conceive to be the artistic ignorance of workmen. There may be observed everywhere the fruits of a disposition among artificers to consider the due development of artistic design less important than a kind of mechanical high polish and finish, which are in all cases thought to be essential to excellence of workmanship. The Jury are by no means disposed to undervalue beauty of workmanship; on the contrary, they consider it essential to the perfection of manufacture; but it is quite clear that in proportion as tasteful design becomes an element in that perfection, mechanical execution must be subservient to its due expression and development. Unless this subserviency be strictly maintained, no amount of skill on the part of the designer can avail. Accurate modelling, for instance, of the features of a face or the toes of a foot, is thrown away, if the workman, prepossessed with his peculiar notions of finish, is to be at liberty to obliterate both features and toes before he can attain the degree of polish which he deems creditable and necessary.

In the cases to which the Jury refer, it is obvious that the deficiency arises from a want of proper understanding between the designer and the parties who execute the work. In an early stage of society,—as indeed must always, to a great extent, be the case in the highest kinds of art,—the artist and artificer, the designer and manufacturer, are the same individuals. This state of things, though on the whole highly favourable to the influence of taste on works of industry is incompatible with low prices, or (which is the same thing) with extensive production. In particular, the difficulty and tediousness of the manipulation of materials so unyielding as metallic substances, while they place a limit on production as it respects quantity, have a tendency to confine the character of the things produced to the two extremes of rudeness and elaboration. So long as the cheapness of an article was attained, not by increasing the mechanical facilities for its production, but by diminishing the amount of hand-labour bestowed upon it, metal-working, so far as the mass of the people was concerned, could never extend itself beyond the few indispensable requisites of every-day life, which, to be cheap enough, must be of the rudest description,—such, in fact, as we still see in the specimens of household and other utensils among the Oriental manufactures now exhibited. With respect to the wealthier classes, on the other hand, the inducements lay in the opposite direction; it was the interest of the artificer to enhance the value of his productions by elaborate and varied workmanship of an ornamental kind, for which alone he was likely to obtain adequate remuneration. Thus every single production, on which labour

beyond a certain indispensable amount was bestowed, partook more or less of the character of a specific work of art, identified with the producer as an artist, and reproducible only by a reiteration of the original process by the same or equally competent hands.

It is not difficult to anticipate the effects which the substitution of machinery for hand labour must produce on this *aboriginal* character of industry. However great the improvement likely to arise, both with respect to quality and cheapness, in the fabrication of objects of utility, it was inevitable that, for a time at least, a deterioration should take place in ornamented manufactures. The old relation, or rather identity, between the artist and artificer must cease to exist under a system, in which the application of ornament depended no longer solely on the skill of individual artist-workmen, but on the capabilities of mechanism, or chiefly so. The influence of taste, accordingly, had to be exerted by new methods, which, from the necessities of the case, could only develop themselves slowly.

In the first place, the earliest efforts of machine labour are directed to the production of objects in their simplest and least ornate form. Imperfection of machinery, and the primary purpose of machine labour, viz., cheap and extensive production, both tend to impose this condition, and to impart to manufactures a mechanical and *unartistic* character. It is not only the interest of the manufacturer, but matter of necessity, in the first instance, to exclude whatever cannot be easily and cheaply executed; and thus, on the application of machinery to any new branch of industry, there occurs in almost every case an interval during which the services of the designer are reduced to their *minimum*, even if they are not, for the time, virtually dispensed with. But apart from this consideration, it is to be remarked, secondly, that the application of machinery brings with it new difficulties in the way of taste. On the one hand, the conceptions of the designer are not, as before, limited solely by his skill as a workman. The capabilities of each particular process of manufacture have now to be studied; and the adaptation of design to these, forms, of itself, an art of considerable difficulty and of slow acquirement, fettered as it is by questions of economy in execution, and embarrassed and impeded by continual improvements, or, at least, changes in the machinery or process employed. On the other hand, the *mise en fabrique* and the finishing processes, if they do not necessarily in most cases fall into the hands of persons *artistically* disqualified, do so, at least, in the first instance; and this obstacle to the due execution of ornamental work not only becomes inveterate by use, but has mistaken views of economy in favour of its perpetuation.

It is, at least, a fact, that while the application of ornament to many hardware manufactures has gradually become more extensive and of a higher order, the character of the individuals employed in the workshops, with respect to artistic intelligence, has not been proportionably elevated. They, for the most part, retain the ideas belonging to the primary, mechanical, and generally *unartistic* condition of manufactures. While our designers have advanced, those who execute or finish their designs have remained stationary; hence the appearance, of which the Jury have so frequently had occasion to notice instances, of a mechanical high polish, which has obliterated or spoiled the details of form or surface, evidently intended by the designer.

This is not, however, an evil peculiar to the hardware manufactures of this country. In France, in particular, some years ago, the artistic ignorance of the workmen employed in the chiselling and finishing of bronze and other metallic wares, was found to be so serious an obstacle to improvement, that it was considered necessary to establish a school for the express purpose of affording to artificers instruction in drawing and modelling, combined with the practice of chasing, chiselling, and finishing castings in metal. And it may be noticed, that the Trades' Schools of Prussia and Bavaria are expressly based on a recognition of the principle, that if the modern exigencies of manufacture require a separation between the designer and artificer, the influence of the former can

in no other way be duly maintained, than by teaching to the artificer so much of the design as will enable him to appreciate the intentions of the designer; and to the designer, so much of manufacturing processes as will secure the practicability and fitness of his designs.

The Jury are, however, by no means inclined to take a discouraging view of the position of the ornamented hardware manufactures of the United Kingdom. There was no reason to expect, on general grounds, that an entirely new system of manufacture should be perfected otherwise than gradually, or be exempt from the characteristics of progress which have always marked the advancement of art and industry. All experience would have been belied, had the progress of England, the parent of this new system, been other than it has. Our Industrial system has been gradually and entirely remodelled. Step by step as machinery, and the various reproductive facilities of modern times, made their encroachments on the old methods of hand labour, we were, in every case, as it were thrown back on the primitive condition of labour. That very want of skill and inexperience which, in early stages of society, oblige men to busy themselves solely or chiefly about the necessary, the useful, or the convenient, restrained the earlier efforts of machine labour, and gave it the same bias. And if we consider the vast commercial advantages reaped by this country from unornamented machine-made wares, and that the deterioration of the ornamented sorts was, and is now, to a large extent, commercially speaking, of no importance, because counterbalanced in the eyes of the majority of purchasers, by other qualities more easily appreciated, we shall be at no loss to account for the present general inferiority of British hardware, in point of taste, to that of some other countries. It is obviously an inferiority, not so much positive and permanent, as arising out of a particular stage of progress. Commercial interest has not yet, in this country, forced on manufacturers the consideration of questions of taste, to the same extent as has been the case elsewhere. It is only, indeed, within comparatively a few years, that the national success in the market has been generally even suspected to be endangered by want of taste.

If, then, the due adjustment of the *mechanical* and the *artistic* elements of perfection in manufacture is a problem yet to be solved in this country, it is because the point of progress has not yet been reached at which its solution becomes possible; if that solution has been postponed beyond what may appear a reasonable period, it is because the mechanical element, bringing with it new and unheard-of advantages, commercial and utilitarian, has been borne along on an overwhelming tide of success, and carried beyond its proper bounds, closing up for the time, or obstructing more or less the avenues to the influence of taste. If due means for securing that influence have not been used, or only partially so, it is because the commercial necessity for using them has been either not felt at all, or felt partially. But there is nothing unhealthy in this state of things; the utmost that can be said, is, that the manufactures of the United Kingdom, with respect to taste, are in a state of transition. The artistic element has begun to assert its claims; and if its working is for the present uncertain, irregular, vague, and unequal; if British manufactures exhibit for the present, at once the most successful and the most abortive attempts at ornamentation; if the means used to obtain designs are often erroneous and illegitimate, and the modes of working then inadequate, it is the consequence of a state of transition resulting from the introduction of a new, and in some respects, antagonistic element, which has not yet secured its position.

These observations will, in part, have anticipated some of the remarks which, in the second place, the Jury have to make on the general aspect of the objects contributed to Class XXII., by the more eminent continental nations. It must be noticed, however, in addition, that as the industry of the United Kingdom owes its existence to private enterprise, so its course has been determined solely by commercial demand, and the current of ingenuity. Fiscal regulations may have impeded its extension in certain directions; but its condition is, to no

appreciable extent, traceable to the direct fostering care, or to the controlling influence of the Government. It has taken its own course. It is a vigorous and independent manufacturing system arising out of the substitution of machinery for hand labour, wherever it was practicable; a system which, not only impelled by necessity, but induced by interest, developed itself solely or chiefly in the first instance in the direction of the indispensable, the useful, and the convenient; and which, by a natural progression, is tending towards the ornamental; and is now, in fact, exhibiting signs of the fermentation consequent on the insertion of the new leaven of taste and refinement. Whatever its progress in particular cases, it has followed this course on the whole; and in this respect it presents a contrast to the industry of some of the more powerful nations of the continent of Europe. That of France, in particular, may be said to have proceeded by an opposite course. It started with an artistic system of manufacture, patronized and supported by Government influence and resources; and its progress has, for the most part, been downwards from the supply of the artificial demands of luxury and refinement, to the necessary demands of utility and comfort. There can be no question whatever about the pre-eminent excellence of the national ornamented manufactures of France; but there is as little doubt that, commercially considered, this pre-eminence is to a great extent artificially maintained. It is not so much the result of a healthy, independent, self-relying, and self-supporting system of manufacture, of which machinery is the basis, and which owes its existence to private enterprise and capital, and its direction to commercial demand, as of a patronage and an expenditure, which disregard both cost and immediate profit.

The Jury, however, must not be considered to offer any opinion here on the question whether it be advisable in any case, that a Government should apply its influence and resources to the promotion of certain branches of industry, or to speak more strictly, should monopolise those branches:—they are desirous merely of directing attention to the fact that this is done in France, and some other continental countries (as, for example, in Prussia); because they believe that a strong characteristic of French industry is traceable to this source. It is to a great extent artistic, rather than workmanlike. The artistic element hinders the development of the mechanical; precisely the reverse of the case in the United Kingdom, in which the mechanical overwhelms or overspreads the artistic. In the former, artistic skill is the starting point; in the latter, mechanical. In the one, artistic skill is indigenous: mechanical, for the most part exotic; in the other, the reverse is generally true.

There are, of course, exceptions, some of them remarkable in both countries; but in general it will be found that in France there is a tendency to emulate the national manufactures, and to confine production to the supply of expensive luxuries, which is injurious to the development of useful industry; while in the United Kingdom the utilitarian principle has tended to hinder the development of taste. The exceptions are, however, hopeful on both sides; and if it cannot be said that as yet either has solved the problem how the *artistic* and the *mechanical* elements of industrial perfection are to be duly adjusted, a great step has been gained towards its solution by the opportunities of comparison afforded by the Exhibition of 1851, which, in that respect, the Jury are confident must prove beneficial to the general interests of industry and manufacture.

In the foregoing remarks on ornamented manufactures, reference has been chiefly made to those of France and of the United Kingdom, because the Jury conceived that, so far as the points under consideration were concerned, these two might be safely assumed as representatives of opposite systems, which are more or less followed, in either direction, by other countries. More obvious extremes might, perhaps, have been found in the United States of America, on the one side, and some oriental nations on the other; the former following almost exclusively the utilitarian and mechanical system—the latter, the artistic; but the examples adduced will admit of a sufficiently extended application.

It must now, however, be noticed that, in the view taken by the Jury of the contents of Class XXII., they have gone no further than the actual character of the objects brought before them. They have taken them as they found them; and, placing them all, for the time, on an equal footing, have estimated their merits by simple comparison. It was obvious, indeed, that the more *actualities* of the Exhibition must, in the main, be the sole objects of their criticism: the actual merit of a work, independently of the circumstances under which it was produced, must be the ground of their award. No other course was open to them but this. Wherever merit appeared must be recognized for its own sake: when a comparison was instituted between the similar productions of different countries, the basis of such comparison must be confined within the walls of the Exhibition.

It is proper, therefore, to advert to some consequences resulting from this necessity imposed on the Jury.

In the first place, single specimens of a manufacture have come before them, of the highest merit in themselves, which, however, are unaccompanied by any evidence either that the high excellence they display is not exceptional, or that a profitable industry, of the kind to which they belong, has any existence in the country whence they are sent. Yet these single examples, perhaps the unusual fruit of individual skill, are brought into comparison and competition with works of the same sort produced in other countries in the ordinary course of commercial enterprise.

To take another case: contributions, which, though few in number, are yet sufficient to evince the existence of a branch of industry, come from countries where they can be produced only at a cost which places them beyond the reach of moderate fortunes. In such a case it is quite clear that the amount of hand labour bestowed on ornamentation and finish becomes a secondary consideration; yet these must be compared, in point of actual merit, with manufactures of the same kind produced under a rigid economy of material and labour, and intended for ordinary purchasers.

Or again: specimens of manufacture are contributed by Government establishments, in which the cost of production, and, at least, immediate profits are disregarded, which nevertheless enter into competition with the efforts of a self-supporting industry in other countries.

Cases such as these make it evident that an actual superiority in the specimens exhibited cannot be assumed as the index of an industrial and commercial superiority, unless it can be shown that those specimens have been produced under the ordinary conditions of commercial enterprise. No one doubts that a branch of ornamented manufacture may be carried to the highest perfection, both mechanical and artistic, in any country, provided due means are used for that purpose, with little or no regard to outlay and profit. It is almost a matter of course that manufactures so protected, should be superior to those which are carried on under all the difficulties and embarrassing obstacles that beset remunerative industry. The wonder is rather that the produce of the latter, having no allowance made for the disadvantages it labours under, should be able to bear so well a comparison in point of actual results.

The Jury, then, while they have willingly rewarded merit wherever it has appeared, have at the same time regarded that merit with greater satisfaction when it was found in the productions of a self-supporting and remunerative industry. They confess that they have looked with greater interest among the contributions from abroad for evidences of a healthy, useful, widely-extended, and self-supporting industry, than for remarkable proofs of skill in particular manufactures. On this point they wish that it had been in their power to have entered at some length; but so many questions are involved in the consideration of it which are foreign to the purpose of this Report, that they must content themselves with a very general statement of some observations they have made.

In Egypt, Persia, Turkey, Tunis, and India, metallurgy and a certain knowledge of alloys date from remote

periods; but, as has been already noticed, productions in metal analogous to European hardware of the commoner sorts are of the rudest description, though excellent in material and generally graceful in form. For the most part there is no step between the manufacture of the rudest contrivances, and that of articles of the most costly and splendid character. The objects wrought in metal are either on the one hand as cheap as the material and the smallest possible amount of labour permit them to be, or on the other, as costly as elaboration can render them. It is to be regretted that the contributions from China are too incomplete to give an adequate idea of the hardware manufactures of that remarkable country. They certainly take a considerable range; and, considering the ingenuity, the inventive genius, and the peculiar domestic habits of the people, may with some reason be supposed to make a considerable approximation to the more or less utilitarian character of European manufacture.

In Greece and Italy the same stagnant traditional industry in metals seems to prevail. From the former nothing, and from the latter nothing of any note, is contributed to Class XXII. It is to be regretted indeed, that specimens of the rude, though in some respects, beautiful metallic manufactures of Italy, in use among the common people, such as lamps, braziers, brass, copper, and tinned-copper vessels, have not been sent. There is nothing, however, in their place to indicate the existence of a more advanced condition of this branch of industry. With Italy, Spain may be classed; a country so rich in metallic ores that the very backward state of its manufactures in metal may well excite surprise. The few contributions from Spain, however, give evidence of both the desire and the power to improve that kind of industry; and possibly, when means of easy and rapid transit are obtained, the natural advantages of the country may be turned to better account, and this species of industry rise to importance.

Austria, the States of the Zollverein, and Belgium afford ample proofs of activity. The first-named country, in particular, exhibits remarkable productive vigour, and her manufactures take a range which shows how firmly and deeply industrial and commercial tendencies have taken root. Iron manufactures appear to be in a most flourishing condition, to which the superior quality of Austrian iron, notwithstanding its costliness for ordinary purposes, no doubt contributes. Considerable surprise, indeed, has been created by the extent and the quality of production in the branches of industry employing iron, such as nail-making, the manufacture of scythes, pick-axes, hatchets, axes, saws, and other cutting instruments; shovels, hoes, and tools of various sorts.

One branch of hardware industry, viz., the manufacture of Jews'-harps, is represented solely by Austria; and, judging from the number of exhibitors, must form a trade of considerable extent.

The iron wire, wire ropes, wrought-iron tubes, and lead drawn pipes, enamelled iron ware, and wrought and cast iron generally, are particularly deserving of notice.

The contributions from the States of the Zollverein are also such as to indicate an active state of commercial enterprise in certain directions. They consist chiefly of cheap hardware, including toys and various articles made of japanned tin, lead, pewter, and other materials, common cutlery and ironmongery, buttons, &c., the cheapness of which, notwithstanding the generally high price of the raw materials, enables them successfully to maintain their place in neutral markets. Some excellent specimens of brass and iron wire, manufactured in various ways, also appear among the contributions from the States of the Zollverein.

Belgium, though not contributing largely to Class XXII., is distinguished, as will be noticed hereafter, for the great extent and excellence of her manufacture of nails, and the application of zinc to a variety of useful and decorative purposes. The latter is due principally to the efforts of the Société des Mines et Fondrières de Zinc de la Vieille Montagne, of Liège, which raises and manufactures the metal, and exports it to a large extent. The ores of Belgium and Silesia are abundant and easily

worked; and the many uses to which the metal, its ores, alloys, and oxides may be applied, have created for it of late years a rapid and extensive consumption. In close proximity to Belgium, at Stolberg, in Rhenish Prussia, a district rich in blende and lead ore, there are the newly-opened, and at present actively-worked mines and manufactures of spelter; and also at Verviers, the Société de la Nouvelle Montagne and other Companies have been formed to meet the rising demand for this useful metal and its manufactures.

In the Department of the United States of America the Jury find but few objects belonging to their Class; those few, however, display energy, ingenuity, and the most perfect adaptation of the means to the end. They are mostly manufactures in iron, such as locks, cut nails, stoves, cooking apparatus, and other objects for ordinary use.

The Jury will now proceed to make such observations as they deem the purpose of their Report to require on certain branches of industry. For a detailed account of the contents of Class XXII. they must refer to the Descriptive and Illustrated Catalogue, already published; and it will be of course understood that the omission of any notice of specific manufactures by no means implies that those manufactures have been overlooked, but merely that the condition of them is satisfactory, or such as to call for no particular observation. In the list of the awards of the Prize Medal it has also been thought advisable to omit merely commendatory notices. The fact that a Medal has been awarded must be assumed as the highest commendation of the Jury; who have therefore contented themselves with a simple statement of the merit specially recognized in the award.

#### 1. BRASS, COPPER, ZINC, AND TIN MANUFACTURES.

The brass-work of the United Kingdom is particularly distinguished for that beauty of workmanship which is generally characteristic of British wares. Excellence of material, solidity, brilliancy of polish, and flatness and equality of the "dead" or "frosted" portions, admirable fitting of the joints, and a certain appearance of thorough genuineness, are qualities pervading all the productions in this material exhibited by the manufacturers of Great Britain. These qualities appear to great advantage in certain branches of industry which admit of a moderate amount of ornamentation, in the shape of mouldings, twisted columns or tubes, corner-pieces, perforated plates, and the like, which machinery can readily execute. In such cases, in addition to very perfect workmanship, there frequently appears considerable evidence of a feeling for harmony, and for a just proportion and arrangement of parts. Eminent examples of work of this character occur in the collection of brass-work (chiefly bedsteads), exhibited by WINFIELD (373, pp. 639, 640), of Birmingham; and in the Mediæval Court, among the ecclesiastical brass furniture and utensils contributed by Messrs. HARDMAN (700, p. 668), also of Birmingham, which are remarkable besides for the perfect intelligence with which the ornamentation (entirely Gothic) is designed and executed.

Brass-work of a character solely or chiefly ornamental can scarcely, however, be considered to be on the whole in a very advanced condition. There are numerous examples of excellence in nearly all branches of industry employing this material; but there is, perhaps, scarcely any collection which displays throughout, whatever may be the amount of ornamentation, a uniform good taste and intelligence in design. It has been said that the vulgar taste in which certain articles are designed and executed finds admirers for whose predilections it is the interest of the manufacturer to provide; but the Jury believe that, even admitting the existence of a vicious taste among consumers, and giving due weight to the motives of self-interest, which of necessity actuate producers, that policy is very shortsighted, which, for the sake of a partial present advantage, sacrifices the general success of a branch of industry. They consider it very doubtful, besides, whether those who act on this view, do not in reality underrate the tastes of those for whom they profess to provide. Instances illustrative of these ob-

servations will be found among the innumerable applications of brass-work to which the use of gas has given rise; such as fittings, brackets, pedestal burners, chandeliers, table-lamps, &c., both for domestic use, for shops, and for public buildings, all of which are of excellent and substantial workmanship, but many marked by a vicious taste and the absence of artistic knowledge. Articles such as these being in common use, and constantly before the eyes, have a considerable influence on public taste, which it is accordingly in the power of manufacturers to guide to a larger extent than they seem willing to suppose.

These remarks scarcely apply to English brass-work struck from dies. The cornices, curtain-pins and bands, finger-plates, &c., prepared in this manner are intended for purchasers chiefly belonging to the cultivated classes; yet the specimens exhibited are almost uniformly better in execution than design. This is the more to be regretted, because the merit of work of this kind, supposing no defect in the metal, due precision in the impression, and a proper colour in the lacquer, depends entirely on the excellence and propriety of the design. A good design, in fact, can be as easily and cheaply executed as an inferior one; and although the Exhibition furnishes a few creditable specimens, this branch of manufacture will no doubt advance as knowledge of art and good taste are cultivated. It is necessary, however, to observe, that the specimens on the French side are not on the whole superior to those of British manufacture; and possibly, sufficient attention has not yet been paid either in this country or abroad to the character of design, and the peculiar artistic effects which are compatible with the process of execution.

Bells and gongs coming to a certain extent under the description of Musical Instruments, the Jury considered it advisable to request the assistance of the Sub-Jury A. of Class X., who obligingly communicated to them a Report on the merits of the various bells exhibited. This Report will be found in the Appendix (B).

The ornamental brass-work of French manufacture, which, besides being the largest contribution from any foreign country, enters most successfully into competition with home manufacturers of the same kind, is generally remarkable for skilful and varied artistic treatment. It differs from the British rather in the uniform intelligence with which the ornamentation, whether little or much, is designed and executed, than in the absolute superiority of individual examples. The ornamentation is of every kind: ranging from profuse and heavy scroll-work to decoration in low relief; but there may be remarked, in particular, a taste for a peculiar treatment which produces a richly-studded or jewelled effect, with sharp, clear, and decisive shadows, approaching to the character of the work termed Elizabethan. The introduction of colour by means of jewels in paste, by enamelling, or by a difference of metal, is more frequently taken advantage of by French than by British manufacturers. By these aids, and the enrichment of surfaces by ornaments of a similar character, a picturesque and frequently brilliant effect is imparted. In careful finish, however, much is to be desired; the joints and fittings of separate portions being often so clumsy and unworkmanlike as to create dissatisfaction on a near examination. This deficiency may be exemplified by a comparison of the ecclesiastical brass-work exhibited by POUSSIERE-GUENAND (France, 1405, p. 1243), with articles of a similar character in the collection furnished by Messrs. HARDMAN, of Birmingham (533, p. 701), in the Medieval Court. In this instance, besides, the French productions display far less intelligence in design than the English; the former being imbued to a considerable extent with the peculiar character proverbially, though now improperly assigned to Birmingham work; while the latter is entirely devoid of it.

French bronzes and small ornaments of mixed materials, *pendules*, dishes and bases for flowers, &c., are exhibited in great profusion, and on the whole merit high commendation. The spirit, fancy, and invention they display are unbounded. Here again the remark is applicable, that simple examples on the British side, for

instance from the collections of J. A. HATFIELD (135, p. 829), of POTTS, of MEXINGTON (323, pp. 630, 631), and of THE COALBROOK DALE COMPANY (641, pp. 660, 661), may be placed side by side with many of the French specimens with no disadvantage to the former; but that on the whole the French manufactures of this kind deserve the pre-eminence. It may be doubted, however, whether, in point of purity of taste, this praise which the Jury willingly accord does not require some qualification. They find in the bronzes of Prussian, German, and Italian manufacture, a purity of form and a uniform carefulness of design and finish, which they consider well worthy of observation; and which, on a comparison with French works of the same kind, give them an advantage over the latter in these respects. The questionable taste, in particular, in which many French *pendules* are designed, is scarcely compensated for by the obvious dexterity of the modelling and chasing.

The examples of zinc manufactures, castings, and galvanoplastic productions are more numerous from France, Belgium, and the States of the Zollverein, than from Britain. In this country the use of this metal has hitherto been chiefly confined to the manufacture of household utensils and conveniences, such as baths and vessels for culinary and other purposes, for alloys, galvanizing, and coating other metals, and as a substitute for lead in the roofing of houses, &c. On the Continent, in addition to the application of zinc to purposes of utility, (which is carried on to the same, perhaps to a larger extent), the metal has also within the last few years been pretty extensively employed as a substitute for bronze in casting statues and other objects of art both on a large and small scale. For this purpose it appears to offer considerable advantages; though it may be doubted whether experience of its use is as yet sufficient to warrant a very decided judgment. The effect, however, of these castings, whether with a surface of zinc or with another metallic coating, is in general good; and at all events, the cheapness and comparative lightness of the metal seem to be in its favour as a means of forming cheap duplicates of objects of high art existing in the more costly materials of bronze or marble. The specimens exhibited by GEIS (1 Zoll., 267, pp. 1063, 1064), and DEVARANNE and SON, of Berlin (1 Zoll., 280, p. 1065), by Madame DE BRAUX D'ANGLURE (France, 779, p. 1218), and by the BELGIAN SOCIÉTÉ DE LA VIEILLE MONTAGNE (Belgium, 26, p. 1152), are the most noticeable. The latter, in particular, have most fully and successfully exemplified the various uses to which zinc may be applied; and the specimens exhibited are calculated to afford useful hints to the manufacturers of the United Kingdom. The use of zinc for preventing the oxidation of iron, its aptness for perforation, and its general application to domestic purposes, are already recognised in this country: but it is obvious that on many accounts it may be advantageously employed to a larger extent, especially in cases where the unyielding character of iron, and the high cost of copper, present obstacles to their use. The Jury believe that zinc has been scarcely, if at all, resorted to in this country for statuary and the casting of small groups of figures and ornaments.

In copper, zinc, and general brassery, the exhibitors are on the whole not numerous. On the French side Messrs. ESTIVANT BROTHERS (1214, p. 1235) afford examples of brass caldrons of extraordinary excellence of workmanship; and from Belgium a nest of brass pans are sent in an unfinished state, which, however, favourably indicate the condition of that kind of industry. The coffee and tea-urns and kettles of this country present no striking improvement in form or in other respects: and the copper culinary utensils, although well executed, appear to be giving way to vessels of iron, which, owing to its cheapness and the recent improvements which have been made in tinning and enamelling, is likely to supersede the use of copper for these purposes: the objections formerly made to it on account of its weight and the risk of fracture, having been removed by the substitution of sheet for cast iron.

## 2. IRON AND STEEL MANUFACTURES, IRONMONGERY, &amp;c.

The iron manufacture of the United Kingdom may justly claim a very high place. The advantages afforded by a material so cheap and abundant are indicated by the vast extent and variety of its uses; and it may be safely affirmed that no branch of industry, employing iron, need ever languish on account of any scarcity, dearth, or uncertainty in the supply of this important metal.

The whole collection of steel and iron grates, fenders, and fire-places, kitchen ranges, stoves and apparatus for warming and ventilation, is considered by the Jury to constitute a most interesting, and on the whole, a highly-creditable and satisfactory exhibition of the state of those branches of industry in the United Kingdom. In that portion of it which includes tasteful design as an element of merit, the Jury regret to find instances in which a deficiency in that respect is but too apparent; but, on the whole, they are disposed to consider the manufacture of ornamental drawing-room and other grates and fenders, and decorated stoves, to be in a most promising condition in respect to taste. The grates of Messrs. HOOLE, ROBSON, and HOOLE, of Sheffield (140, p. 609), executed from designs by Mr. ALFRED STEVENS (140, p. 609), and those exhibited by Messrs. STUART and SMITH, of the same place (102, p. 603), may be adduced as evidence of remarkable advancement in tasteful design. The former display great beauty and artistic intelligence, while the latter, in some instances less eminent in those respects, are remarkable for general brilliancy of effect, great precision and excellence of workmanship, and certain novel applications of ornament. The Jury wish to notice, with special approbation, those portions in the grates of Messrs. Hoole, Robson, and Hoole, in which the castings remain in the state in which they leave the mould.

The progress of this manufacture in all respects is the more remarkable, considering the absence of foreign competition, and the comparatively short time that has elapsed since it began to assume its present highly-decorative character. It is only since the end of the last, or the beginning of the present century, that this branch of industry was introduced into Sheffield. Previously to that time it had been carried on in London and Edinburgh; and grates or fenders of an ornamental description still continued to be manufactured in those places for the first twenty years of the present century: about the end of which period, manufacturers began to establish themselves in various parts of the country. These, by employing greater artistic talent, became successful competitors with the London houses, whose trade from that time continued to decline, and Sheffield became the principal seat of manufacture for the better and more ornate sort of stove-grates and fenders. Of this sort some few still continue to be manufactured in London; but the London market is now, for the most part, supplied by the works in the town of Sheffield.

The trade in the commoner description of grates is more extensive, and is principally carried on by the Carron Company and other foundries in Scotland, by the Coalbrook Dale Company, and foundries in Northampton, Dudley, Rotherham, Birmingham, Mansfield, Nottingham, and Derby.

The Jury think it deserving of notice with respect to this branch of industry, that in all the communications which have been made to them by the persons engaged in it, they find observations commendatory of the School of Design in Sheffield, and expressive of the high sense they entertain of the services it has rendered to ornamental art, and in particular, to the manufactures of that place.

The articles of this description exhibited by continental manufacturers are few in number, being chiefly stoves; amongst which the grate contributed by ANDRÉ (France, 1053, p. 1229), and calorifères in brass and cast iron, by LAURY (France, 563, p. 1305), are the most deserving of notice.

From the United Kingdom, examples of the ordinary kitchen range are numerous, and uniformly characterised by a sound and substantial workmanship. On the actual

working merits of the various contrivances and arrangements displayed by them, the Jury do not feel themselves qualified to form a very decided opinion. They would, however, observe generally, that in many cases the massiveness, extent, and heavy character of the iron-work appear to be carried to excess, and a wider space sometimes assigned for fuel than is necessary, or consistent with economy. It is, doubtless, very desirable to give such a degree of strength to a kitchen range as shall insure it in all its parts, against injury from fracture, which is in most cases difficult to repair; and, hence, economy of material is not to be regarded as a primary consideration; but the difference between the large extent and massiveness of some ranges, and smallness and chest-like appearance of others is so extreme, while the professed and possibly the real capabilities are about equal, that it is evident we have not yet arrived at very distinct conclusions respecting the exact adaptation of the means to the end in this branch of industry. Much of the variety in size, and as a consequence of this, in arrangement, is no doubt due to the necessity of providing for the different sizes of kitchens and fire-places; a necessity which must, on the whole, tend also to maintain high prices. It must be admitted, besides, that obstacles to improvement and the speedy adoption and testing of new contrivances arise out of the arrangements current in England between landlord and tenant. A kitchen range comes under the description of what are termed "landlord's fixtures," and in many, perhaps the majority of cases, has been selected more on the ground of economy in the first outlay, than with any view to the excellence of the contrivance or the permanent comfort and convenience of the occupant, who, though dissatisfied, finds it difficult on several accounts to disturb the agreement he has come under.

In Scotland, grates are the property of the occupant, but it is doubtful whether this circumstance contributes on the whole, to improvement. A large majority of tenants are more able to pay annually a small addition to their rent as interest for the outlay of the landlord on grates, than to incur that outlay themselves; and hence with such persons, economy outweighs all other considerations.

Taking all the circumstances into account, the Jury think that the attention of our kitchen-range manufacturers might be advantageously directed to the production of one which, compact, moderate in size, economical in fuel, and answering all the ends of convenience that must be provided for in the majority of cases, might be sold at a low price. They are unwilling, as has been remarked, to offer any decided opinion on the comparative merits of the ranges submitted to them, more especially as those merits are so generally uniform; but if they were to make a difference, they would say that the kitchen range of J. FLAVEL, of Leamington, Warwickshire (38, p. 596), for appearance of workmanship, economy of fuel, and its combination of the stove and open fire seems deserving of special notice. The cooking stove of EVANS and SON (103, p. 603) exhibits a somewhat novel, but not unsuccessful attempt to apply to that kind of manufacture a moderate amount of appropriate ornamentation.

The Jury observe with regret that there is no cooking stove or apparatus of first-rate manufacture or extent exhibited among the productions of the Continent. Foreign hotels and large establishments must be furnished with such; and it certainly would have been both interesting and instructive to our manufacturers, to have been able to examine the contrivances by which cooking on a large scale is conducted in countries remarkable for their culinary skill.

The contrivances recently invented for cooking and heating by gas, of which a considerable number are exhibited on the British side, appear to be well made and constructed; but the Jury are unable to pronounce any united opinion on their efficiency. The chief advantage professed by them is economy; and there seems to be no reason to doubt the justness of their claim to that advantage, if other more necessary conditions are complied with; but it would appear that as yet, more

unquestionable success has attended the application of gas to warming apartments, than to cooking, or heating water for baths. It would, however, be unreasonable to expect the entirely successful application of a new *calorific* power, with an experience so limited as we now possess of the conditions under which it may be rendered available; and the Jury accordingly refer to these contrivances less for their present completeness and efficiency than for their probable future importance, which, some of its members believe, can hardly be over-estimated.

Casting in iron forms a large and important branch of industry wherever the advantages of iron and fuel are possessed to an adequate extent. Owing to the variety of coal-fields, abundance of the mineral, and improved modes of smelting, England is distinguished above other nations for the exuberance and cheapness of her supply of iron, and for the extent to which it is employed in casting. If, however, the quality of articles produced by casting be considered, the contributions from France, Belgium, Prussia, and Austria, will show that she has powerful rivals to contend with in that respect. The iron castings from these countries display a sharpness, cleanness, and closeness of texture, and a good taste and intelligence in design, which afford much reason to doubt whether any pre-eminence can be accorded to this country, except so far as mere quantity is concerned. It is, of course, not to be forgotten, that the comparison can only be made within certain limits. The iron castings of this country, if they do not actually take a wider range than the continental, do so in the Exhibition; but still if the comparison be confined to objects of a similar character, the Jury believe that the palm of superiority must be assigned to the continental specimens, which on the whole are distinguished more highly for skilful casting and intelligent and appropriate design. Among the most eminent in these respects they rank the cast-iron bedstead of J. P. V. ANDRÉ (France, 1053, p. 1229), which is exhibited in the state in which it comes from the mould, as a pure casting to which the file has not been subsequently applied. The founder, in this instance, has succeeded, either by attention to the quality of the sand, or to the temperature of the metal, in producing impressions of the most beautiful distinctness. Some of the castings of MOREL (France, 1666, p. 1256) have also much elegance and lightness. It may be added that the railings, and generally the iron castings exhibited on the French side, are light and graceful in appearance; and the Jury believe it extremely probable, that if the iron founders of France, with their facilities for obtaining tasteful designs, enjoyed the advantage of a larger supply of cheap material—either by improvements on their mode of smelting, or by the removal of impolitic restrictions on the importation of foreign iron—they might, besides greatly increasing the demand at home, become successful exporters to this country, where ornamental castings of really excellent design and low price are by no means largely supplied.

THE ROYAL PRUSSIAN IRON FOUNDRY (1 Zollv., 271, p. 1064) also exhibits specimens of iron casting of a very high order. The minute and delicate castings, consisting of trinkets, small chimney ornaments, and figures, executed at Berlin by private enterprise, are already favourably known in this country. They are, it is said, the produce of small furnaces, from which, by great care in the choice of iron and other precautions, the founders are enabled to obtain the metal in a degree of fluidity necessary to fill the minute and sometimes intricate moulds employed. The more important works contributed by the Royal Prussian Iron Foundry sustain the reputation of Berlin iron casting. In particular, the Jury notice with approbation two cast-iron pedestals with figures and scrolls in high relief, surmounted by equestrian statues, works which they consider most spirited and beautifully cast.

A bust of the king of Spain, cast at the ROYAL ORDONANCE OF PRUSSIA, may also be noticed on account of the delicacy and precision of the impression (Spain, 280, p. 1347); and for the same reason, busts of the king and late queen of the Belgians, by the firm of VAN DER BRANZEN and Co., Brussels (Belgium, 363, p. 1169).

The iron casting of the United Kingdom, though already, as has been observed, of great extent, might doubtless be more largely employed for purposes both of use and ornament. It is probable that the expense of new moulds, the difficulty of obtaining appropriate designs, and a prejudice existing against iron on account of its liability to fracture and oxidation (though the latter fault may possibly be obviated), present in many cases obstacles to its more extensive use in construction and decoration. That it is susceptible, in casting, of the most perfect and sharp impressions, is clearly evinced by the examples already noticed; and the successful rendering of Mr. J. BELL's statue of "The Eagle Slayer," by the COALBROOK DALE COMPANY (641, p. 659), shows that the cost of many public monuments might be reduced by bringing into use, as a substitute for bronze, a material cheaper than zinc, and more easily procured in this country. On the whole, and considering the comparative merits of British and foreign iron casting with respect both to execution and design, the inferiority of the former may be said, as in other cases, to be general, and on an *average* rather than special. There are examples from the United Kingdom which, in all respects, may challenge comparison with the productions of any country; but the average merit of British iron castings of an ornamental kind is lower than that of France or Prussia; and it will probably be found that the pre-eminence of those countries is due rather to the employment of better artists for the preparation of designs, and artisans more intelligent in design, than to any superiority in the mere process of casting. In other respects, some of the continental nations labour under disadvantages which do not affect the United Kingdom; and if our iron castings are in any respect inferior, the blame rests with our founders, who neglect to avail themselves of all the means necessary to the perfection of their art.

In the manufacture of locks, Wolverhampton still sustains its ancient reputation. Excellence of workmanship, lowness of price, and an adequate degree of security, characterise the contributions from that place, and prove the advantage of the peculiar division of labour which is adopted in the manufacture. The specimens of locks throughout the Exhibition generally evince that the art is in a very advanced state, both here and on the Continent; but still it is impossible for the Jury to ignore the fact, that the present condition of lock-making is traceable to English ingenuity and invention; and they believe that on the whole the collection of locks on the British side deserves the place of pre-eminence. The lock on the very well-made safe of SOMMERMEYER, of Magdebourg (1 Zollv., 802, p. 1094), may be noticed honourably; and the bank lock of Messrs. DAY and NEWELL, of New York (United States, 298, p. 1453), is remarkable for ingenuity of principle, and for combinations and arrangements which seem to render it impregnable. Locks of this description, if they could be sold at a moderate price, and made available for ordinary purposes, would no doubt be favourably received, and remunerate the inventor. It is, however, a serious objection to any lock, notwithstanding its ingenuity and security, that the key should be so ponderous and bulky as to require for itself a separate place of deposit and safe keeping. The smallness of the key in proportion to the size and strength of the lock is particularly remarkable in the locks of Messrs. BRAMAH (653, p. 664) and of Messrs. CHUBB (646, pp. 663, 664), besides those merits in other respects, which public opinion has so long and so amply recognised.

On the comparative security afforded by the various locks which have come before the Jury, they are not prepared to offer an opinion. They would merely express a doubt whether the circumstance that a lock has been picked under conditions which ordinarily could scarcely ever, if at all, be obtained, can be assumed as a test of its insecurity.

In connection with locks, the Jury may refer to iron safes and treasure-chests, of which a large number is exhibited, and which for the most part are of about equal merit, so far as the chances of security offered by them are concerned. It seems doubtful whether much of the

ornamentation and expensive polished work which some of them display, might not be dispensed with. Any addition of that description to the expense, necessarily considerable, of a safe or treasure-box seems quite gratuitous, more especially since it has become usual, and is considered most secure, in large banking and other establishments, to preserve safes in fire-proof rooms or vaults, into which they are lowered at the close of business.

The locks and general ironmongery of France are inferior in many respects to the productions of the same kind from other continental nations. There appears to be a desire to extend manufactures in metal, but it is rendered powerless by the restrictions imposed on the importation of the raw material into France. It is impossible, under present circumstances, for the manufacturer to reduce the price of his productions to such an extent as to afford him adequate remuneration. Since 1844, the manufacture of iron-tin plates and steel has been more than doubled in the United Kingdom. This, on the one hand, has reduced the price of the raw material, and, on the other, has stimulated those engaged in working it up to supply their goods at a cheaper rate, and to find new markets. This branch of industry, accordingly, with us presents a healthy and growing appearance which contrasts strongly with the stunted condition which seems to characterise the corresponding manufactures of France. On the stall of JAPY BROTHERS (France, 275, p. 1190) the Jury find several articles of tin-ware manufactured from the most expensive charcoal iron, in a mode that so far economises labour, as to overcome the formidable expense of the material:—machinery enabling them to sell a saucepan for 6d. which is made from charcoal iron at 30d. per ton. But in other cases, they are obliged to use the same costly iron without the facilities afforded by machinery, and the consequence is, that prices are too high to insure a large consumption, and industry stagnates.

The enamelled ware of Paris and the coating of tin by the new process of ROUCHER (France, 776, p. 1217) both appear to be deserving of notice. The process by which the former is produced has been employed in this country by the Birmingham Patent Lap-welded Tube Company, who find it extremely valuable as a preservative of their tubes from the action of water in locomotive boilers; iron tubes being variously affected by the different qualities of the water used. The process is also largely employed in Austria and the Zollverein States.

The ironmongery trade of Germany and the States of the Zollverein exhibits far greater activity. The contributions from Iserlohn, Hagen, Barmen, and other places in Westphalia, indicate the existence of a large and profitable industry; and the difference between the price of steel and iron goods in these countries and Birmingham is not so great as to affect its growth and strength. To all parts of the world, and even largely to England, common articles for *sale* rather than *use* are exported, and are vended by hawkers and pedlars through this country. The higher cost of the raw material in Westphalia is compensated for by the cheapness of labour, and the manufacture being an ancient, not a modern one—Westphalia having for centuries been celebrated for ironmongery and tin goods—the common wares sent to this country are sold at very low prices. On weighty articles of iron, however, such as anvils, vices, and heavy tools, the difference of price between Sheffield or Birmingham and Hagen, is about the amount per cwt. of the duty on iron; and such articles as these are accordingly precluded from competition with the British of the same description in foreign markets.

A new use of sheet-iron, prepared by a coating which imparts to it a surface that takes freely the mark of a slate-pencil, is exhibited, from Wurtemberg. It is much lighter and much less liable to injury than common slate, and appears to be a clever adaptation of iron to an everyday purpose. Along with this may be noticed a singular illustration of the pliability of sheet-iron exhibited by T. L. PALMER (France, 942, p. 1225). It is a quart bottle very perfect and without seam, such as might be employed with advantage for the conveyance of mercury,

instead of the heavy cast-iron bottles now used for that purpose.

Among the manufactures of iron sent from the Continent, none are more remarkable than the hand-made nails of Belgium. This branch of industry in Belgium is of very large extent:—no less than from 8,000 to 9,000 tons being exported annually, principally of the small sizes called “Flemish tacks.”

Belgium approaches more nearly than any other country to the United Kingdom in the quantity and price of its iron; the difference in favour of the latter averaging about 20s. per ton on the principal sorts of iron. It is worthy of notice, however, that the price of “nail-rods,” the kind used in the manufacture of nails, is lower in Belgium than in England; a fact which seems to indicate that a constant and regular demand for one description of iron will not only insure its supply but diminish its cost, possibly by the inducement held out to the exercise of ingenuity on the means of economising the cost of production.

The sorted samples of hand-made nails exhibited by the SOCIÉTÉ ANONYME DE COUILLET (Belgium, 120), were considered by the Jury to be so excellent in every respect that they were desirous of according to that Society the highest mark of commendation in their power; but they were prevented from doing so from the circumstance that M. F. Spitaels, President of the Société de Couillet, is also one of their members, and on that account precluded from entering into competition.

The hand-made nails of Austria, which do not appear to be exported to any extent, are also of excellent quality, and remarkable for a peculiar twist given to the shank of the nail, which is said greatly to increase its tenacity. For railway spikes this twist has been in use, though not generally, in the United Kingdom; but its application to the small sizes, including those termed “pointes de Paris,” is shown only in the samples from Austria. Of these, the productions of the establishment belonging to COUNT DUBSKY (456, p. 1033) deserve particular notice.

The machine-made nails of the United States must also be referred to. This trade is of very great importance: at the least from 35,000 to 40,000 tons being manufactured annually. For this and other purposes, such as ship-building, boiler-making, &c., large quantities of cheap iron are imported from Great Britain, which, owing to the wide extent of American sea-board, can be supplied to most of the southern states of the Union, at a cheaper rate than would be the case even were the prices in Pennsylvania and in Great Britain the same at the works.

With respect to articles of a miscellaneous description, the Jury must refer to the explanatory Catalogues already published. They would merely observe that, on the evidence furnished by the Exhibition, there can be no doubt that the hardware manufactures of the United Kingdom are alone co-extensive with the wants, the comfort, and the conveniences of civilized life. In some countries refinement and taste are more amply provided for; but at a comparative sacrifice of the interests of the many. In other countries particular branches of industry, of a useful and ornamental, and sometimes of a useless though profitable kind are cultivated to a considerable extent; others appear to be entirely devoid of any industry but such as either supplies the mere necessities of life, or ministers to the artificial and expensive wants of an aristocracy. In the United Kingdom alone industry has no exclusive bearing. Cheapness and abundance for the many, are as much its rule, as splendour and costliness for the few. It alone exhibits an effort to meet every possible demand which taste, refinement, comfort, convenience, economy, or necessity can make upon it. The extent to which that effort has been successful, in certain directions, admits of question; but that the effort has been, and continues with untiring energy to be, made, is beyond all doubt.

The following are the awards which have been made by the Jury:—

#### I. THE COUNCIL MEDAL.

1. ANDRÉ, J. P. V. (France, 1053, p. 1229).—The high excellence of the castings by André has already been

noticed. The end of a bedstead in cast-iron is considered by the Jury to be one of the most faultless castings in iron contributed to the Exhibition. The design is in good taste, and the sharpness and soundness of the casting extremely perfect. A cast-iron fountain in the East Nave is also a meritorious work; though it may be doubted whether cast-iron is a material suitable for such a purpose, unless protected from the action of water by some hydrofuge.

2. AUBANEL (France, 1055, p. 1229).—This exhibitor has given the highest evidence of his skill, in a group of an Eagle and Lamb, a bronze gilt chimney-piece, and a gilded cast-iron door. The latter is extremely well designed, and beautiful in execution. These, and the above-mentioned works of André, evince with equal success the applicability of cast-iron to artistic uses.

3. BARBEDIENNE and Co. (France, 1709, 1723, p. 1258).—This firm exhibits a magnificent collection of artistic works in bronze, consisting for the most part of reproductions by mechanical processes from ancient and modern works of sculpture. The processes are the invention of Collas, the bronzes finished by the sculptor Clesinger. The Jury consider that the whole collection displays a carefulness, completeness, and beauty of execution which place it in the first rank (Joint Medal with Class XXVI.).

4. THE COALBROOK DALE COMPANY (641, pp. 659-661).—The vast extent of the contributions by this Company, their variety and very general excellence, whether as objects of utility or ornament, seen to claim for them a very prominent place in the awards of the Jury.

This Company, one of the oldest in Great Britain, carries on the largest manufacture of iron and iron trade in the world; the works producing the almost incredible amount of 2,000 tons of finished iron per week.

On a small scale iron works seem to have existed in Coalbrook Dale from a remote period, but the records only extend to the reign of Charles II.

The works of the present proprietors date from the beginning of the last century, since which time they have gradually attained their present magnitude. In the earlier half of the last century the first iron railroad for waggons, ever known in England, was laid down at these works; and its efficiency being proved, the furnaces at the top of the Dale were connected by railway with the foundry at the centre, and the line continued from thence to the stores and wharf on the Severn; from which the products of Coalbrook Dale still continue to be sent down the river in barges for export to their several destinations.

In 1779, the Company had the merit of erecting the first iron bridge ever constructed in England, viz., that over the Severn, near Madeley; the position of which was so advantageously chosen, that a populous and thriving market-town arose in the neighbourhood, and now bears the name of Ironbridge.

The Company is besides remarkable for the introduction of improved modes of smelting, and economy in the manufacture of iron.

The products of the Coalbrook Dale works, now of all descriptions, were, until about twelve years ago, chiefly confined to the manufacture of bar iron, beams, pipes, castings for bridge-work, agricultural implements, and the hollow ware, consisting of culinary utensils, brewing vessels, sugar pans, &c., for which Coalbrook Dale originally obtained its celebrity. Since that period, the attention of the Company has been directed to the production of ornamental castings; and the success which has seconded their efforts is fully exemplified in their numerous contributions to the Exhibition. There is, perhaps, no establishment in which so many different kinds of labour are applied:—its operations extending from the first raising and smelting of the ore, to the ornamenting and burnishing of highly-finished works in iron and steel.

5. J. HARDMAN and Co. (490, p. 668).—Such of the productions contributed by this firm as belong to Class XXII. are admirable in workmanship, and unrivalled for perfect development of the mediæval design and taste in which they are executed. The designs have been for the most part, it is understood, prepared by Mr. A. W. Pugin,

and reflect great credit on that gentleman; but the Jury are more particularly impressed with the very perfect manner in which Messrs. Hardman have developed the artist's conceptions. It evinces a skill in manipulation which might, they conceive, be exhibited to still greater advantage in brass-work of a more varied and ornate style than may be admissible in the particular species of mediæval art to which they have confined themselves.

6. HOOKE, RONSON, and HOOKE (140, p. 609).—The beautiful grates, fire-places, and fenders contributed by this firm have already been noticed. They are designed chiefly in the Italian taste of the earlier half of the sixteenth century, and display a subserviency of the execution to the intentions of the artist, to a degree which places them among the most remarkable contributions from the United Kingdom. The castings on some of these grates have been before alluded to; and it may be added here that there are, besides, some detached specimens shown as they come from the sand, which appear to be quite faultless. On the whole these works are distinguished for a higher and purer taste, and the application of a more artistic ornamentation, than productions of a similar kind have yet exhibited.

7. C. S. MATIFAT (France, 923, p. 1224).—The Jury consider the contributions by this exhibitor to be of a very high order. They are chiefly works in bronze, and broze gilt and silvered, consisting of chandeliers, candelabra, candlesticks, stands for gold fish and for flowers, and various caskets, and chimney and table ornaments; which, for the most part, are designed in good taste, and admirable in execution. The chasing, chiselling, and finishing of these works, the Jury believe to be without parallel in their class. In that respect they would advert more particularly to the stand or fountain for gold fish, a small bronze of a lion and lamb, a casket in bronze and hard-wood, and a lofty candelabrum in bronze. They may also mention (though it can scarcely be reckoned in Class XXII.) an unfinished *pendule* in ivory and bronze gilt, designed by Dieterle, with figures sculptured by several artists from a model in plaster, by Schoenwerk. It is a work of great beauty.

8. FERD. MILLER (Bavaria, 90, 2 Zoll., p. 1102).—The heraldic lion cast in bronze by Miller, of Munich, from the model by Professor Halbig, is regarded by the Jury as a most admirable example of successful casting.

It is said to be one of a pair cast at the same time from the same furnace, and to weigh about six tons. Ample details of the history of this work are already before the public. It may be sufficient, therefore, to notice that the difficulties of casting in bronze, in this instance so successfully overcome, become greater in proportion to the size of the mould to be filled. The liability of the metal to "blow," the precautions necessary to obviate a change in the character of the alloy which takes place owing to the rapid oxidation of the tin, to secure the perfectly-uniform dryness of the mould, and to preserve the mass of molten metal at the high temperature required—are difficulties which it is scarcely possible to over-estimate in a case like this; and the Jury are persuaded that public opinion will justify the high place which they assign to this work as a specimen of bronze casting.

9. THE ROYAL PRUSSIAN IRON FOUNDRY, at Berlin (Prussia, 271, p. 1064), has been already adverted to.

10. SOCIÉTÉ DE MINES ET Fonderies de ZINC DE LA VIEILLE MONTAGNE (Belgium 26, p. 1152) has already been mentioned with high commendation.

11. STUART and SMITH (102, p. 608).—The Jury have had occasion, in a previous part of this Report, to remark the peculiar beauty of workmanship and general brilliancy of effect, for which the contributions of this firm are distinguished. In this respect they stand pre-eminent; and it deserves also to be noticed that this house has, perhaps, more than any other, contributed to impart the highly-ornate character which the stove-grate manufacture possesses at the present time. The grates exhibited by them are for the most part manufactured on "Sylvester's plan;" by which the combustion of the fuel takes place on a metal plate which extends into the room and lies on the surface of the floor. In proportion as custom deviated

from the primitive practice of making the fire upon the hearth, it lessened the comfort arising from a proper distribution of heat. When grates were placed so high as has until very recently been customary, the greater part of the heat evolved passed up the chimney, leaving the lower stratum of air (the coldest part of a room) in contact with the legs and feet. This is obviated by Sylvester's plan, which, besides, affords the advantages of greater cleanliness, and the facility with which the same grate can be adapted to burn either wood or coal. The metal plate on which the fire is made, extending as it does from the fire-place to the fender, admits of being highly ornamented; and Messrs. Stuart and Smith have shown how skilfully they are able to take advantage of its capabilities in that respect.

The Jury have only to add with regard to this award and No. 6, that the fact of their having recommended the award of Council Medals to two exhibitors of articles in the same branch of manufacture, must be assumed as evidence of a well-considered opinion that both exhibitors have pre-eminently distinguished themselves, though by

the development of different qualities of beauty and excellence in their several productions.

12. R. W. WINFIELD (373, pp. 639, 640).—Reference has already been made to the collection of brass-work contributed by this exhibitor, as displaying very perfect workmanship with a moderate amount of ornamentation; particularly in the manufacture of metallic bedsteads, for which he has earned a deservedly-high reputation. His improvement in the construction of these by means of a continuous post which obviates unsteadiness and loosening of the joints, is deserving of attention, as well as the twisted, spiral, and plain tapered pillars or tubes employed for that and other purposes, which are produced in a peculiarly-ingenuous manner, invented by one of the workmen of the establishment.

This house has also had the merit of introducing the combination of plain opal or coloured glass with brass-work, by which flowers, blossoms, buds, or leaves in glass, are made subservient to purposes both of utility and ornament, in the manufacture of cornice-pole ends, curtain-holders, door-handles, &c.

## II. PRIZE MEDAL.

| Prussia                 | 355                        | Ullenberg and Schnitzler        | Screws and wire.                              |
| Austria                 | 460                        | Vingert, A.                     | Nails (assorted).                             |
| Belgium                 | 355                        | Vandercamer, J. A.              | Zinc vessels.                                 |
| France                  | 1531                       | Voizot, E.                      | Steel for jewellery.                          |
| United Kingdom          | 413                        | Wallace and Son                 | Cooking apparatus.                            |
| —                       | 248                        | Wärner, G.                      | Gas cooking stove.                            |
| Prussia                 | 634                        | Wescher Brothers, & Strassmann. | Buttons, &c.                                  |
| United Kingdom          | 656                        | Whitley, J.                     | Wrought-iron hinges.                          |
| Jersey and Guernsey     | 12                         | White, George                   | Ventilator and guard.                         |
| United Kingdom          | 10                         | Whitehead, —                    | Horse-shoes.                                  |
| Prussia                 | 282                        | Winckelmann, J.                 | Electrotypes.                                 |
| United Kingdom          | 525                        | Wiss, R.                        | Self-acting water-closet.                     |
| —                       | 276                        | Wolvenson, E.                   | Lock.   |
| —                       | 8                          | Woodin, D.                      | Horse-shoes (various).                        |
| —                       | 33                         | Woods, W.                       | Hooks and eyes, chains.                       |
| —                       | 347                        | Woodridge, J.                   | Brass fittings, &c.                           |
| Denmark                 | 23                         | Wulff, —                        | Two brass tea-urns, executed by hand.         |
| United Kingdom          | 443                        | Young, W.                       | Vesta lamps.                                  |
| Frankfort-on-the-Maine. | 19                         | Zimmermann, E. G.               | Iron and zinc ware.                           |

## APPENDIX.

(A).

*Extract from Minutes of the Jury for Class XXIX.*

"Messrs. Hoffman and De La Rue report, that they have conferred with the Chairman and Jurors of Class XXII., from whom they learn that in the English and Foreign Sections there are no less than 46 exhibitors of lamps. As it is clearly impossible to examine and test experimentally so large a number of lamps, Messrs. Hoffman and De La Rue suggested that the Jury of Class XXII. should select three lamps only which they considered ought to be so tested. The Jury of Class XXII. explained that much difficulty might arise in such a selection on their parts, as the exhibitors whose productions were not tested might complain that justice was not done them. Messrs. Hoffman and De La Rue fully agree in this view, and therefore for the present leave the decision of the proper course to be pursued, to the Jury of Class XXII., expressing at the same time their willingness to aid them to the best of their ability in any experimental inquiry which time will allow."

(B).

REPORT OF SUB-JURY A. OF CLASS X. ON "BELLS."

The Jurors of Class XXII. having requested the assistance of the Jury, Class Xa., in the examination of

Bells, those Jurors of Class Xa., who attended for that purpose, have to submit the following Report:—

*Bells examined, June 4th, 1851.*

MEARS.—A large bell (in key of F), excellent.

MURPHY (Dublin).—A large bell of very fine tone.

MURPHY (Dublin).—A large bell in the East Nave, connected with clock (said to have been "cast in tune"). Very fine tone.

HODGES.—Four ship bells; good tone and powerful. The brass bell of remarkably pure and good tone, and of great power.

TAYLOR (Loughborough).—Two bells, excellent.

WARNER.—Three bells. The middle one is of a very pure tone.

PETIT and FRITZER (Netherlands).—Bells with suspending apparatus. Good, though if considered as a scale of bells, some of them are not perfectly in tune.

F. GRUHL (Saxony).—A bell in East Nave. Very fine tone.

F. GRUHL (Saxony).—A bell and frame, in gallery. Tone pure and good.

HODGES (Dublin).—A large bell. Excellent.

N.B. The *Gongs* in the Chinese Collection are reported upon by Class Xa. as belonging to a certain class of musical instruments.

(Signed)

H. BISHOP, KNT., CHAIRMAN.

## CLASS XXIII.

## REPORT ON WORKS IN PRECIOUS METALS, JEWELLERY, ARTICLES OF VIRTU, &amp;c.

[The Figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

*Jury.*

ALBERT, DUC DE LUTNES, *Chairman and Reporter*, France; Member of Institute, &c.

HENRY HOPE, M.P., *Deputy Chairman*, Piccadilly.

DON FRANCISCO ELOIZA, Spain; Colonel of Artillery.

JAMES GARRARD, Prime Warden of the Goldsmiths' Company.

JOHN GRAY, 5 Billiter Square, City; Silvermith and Plater.

L. GRÜNER, Zollverein; Architect.

KARI LOVELACE, Turkey.

WESTLEY RICHARDS, Birmingham; formerly Plater and Jeweller; Chairman of the Birmingham Exhibition in 1849.

CHARLES SALLANDROUZE DE LAMORNAIX, France; Commissioner-General of Government; Member of Council of Manufactures and of Central Jury, &c.

ROBERT YOUNGE, Sheffield.

*Associates.*

WILLIAM THOMAS BRANDE, Royal Mint; Professor of Chemistry.

NICOLAS FRANÇOIS LE DAGRE, Judge of the Tribunal of Commerce of the Seine, and Member of the Chamber of Commerce at Paris.

GEORGE MATHEY, 57 Hatton Garden; Metallurgical Chemist.

PERCIVAL NORTON JOHNSON, 57 Hatton Garden; Metallurgical Chemist.

THOMAS VASEY, Moormouth Court, Whitcomb Street; Setter of Diamonds.

Works in all kinds of precious metals occupy a considerable place in the Exhibition. It would, however, be difficult to form from them an exact idea of the relative production of different countries in the various branches of this class of manufactures. Germany has contributed to a very limited extent; Spain has sent but one specimen of her beautiful workmanship in gold and silver for church-service: several French manufacturers of gilt bronzes have not exhibited at all: the Dutch jewellers' work is represented by only a single exhibitor: from Sweden, Denmark, Bavaria, and the kingdom of Naples, nothing has been received: America has furnished but an insignificant display: and other exhibitions, hurriedly formed, do not truly represent the actual production of the respective countries. Thus, China offers a miscellaneous collection of objects, some of them made several centuries ago, others of English manufacture, or borrowed from private individuals. The Indian exhibition is a treasury of riches accumulated by the East India Company, belonging to widely-different epochs, amongst which it would be difficult to distinguish at once what is modern. The Ionian Islands are represented by a few specimens only.

From the above it is evident that the Jury were compelled to be on their guard against error in their general appreciation of the productions—error which the uncertainty of a first experiment of a Universal Exhibition, the remoteness of some countries, and the reluctance of some manufacturers to come forward, must of necessity entail. The information asked for of the Foreign Commissioners would have been very useful towards drawing up more exact commercial observations; but not having received it in time to be of service, the Jury have confined themselves to the Exhibition itself.

It is sufficient to cast a glance upon these exhibitions of India, Turkey, Egypt, and Tunis, to be convinced that these nations have remained stationary from a very early period of manufacture. Some of them, indeed, develop ideas full of grace and originality; but their productions are always primitive and imperfect, and the skill of the workman is called in to make amends for the inadequateness of the manufacturing resources. Their exhibitions might, nevertheless, afford a lesson to the European manu-

facturers, for they display a natural grace in the arrangement of ornaments most happily conceived. Jade, inlaid with precious stones by means of golden bezels, as shown upon some of the very ancient articles in the Indian exhibition, is an elegant and skilful work of art. The filigree from the same country is as perfect as that from China; and the Indian enamels, though for the most part coarse, exhibit, nevertheless, much merit in design and harmonious arrangement of colour.

The European nations must, by the means here afforded for comparing their productions, render each other mutual service. France and Germany will borrow from England whatever is worthy of imitation in her manufacture of plate for useful purposes; while England may derive instruction from the gold and silver smiths of the Continent, in reference to objects of ornament cast or repoussé, and finely chased. Gilt bronzes likewise may become better appreciated, and be manufactured upon a larger scale. In the setting of precious stones, jewellers will call to mind the beautiful productions sent by Russia. Regarded in an artistic point of view, the French, German, and Russian exhibitions will leave permanent traces behind them; and every nation, according to the amount of its genius for imitation or invention, will easily discern the onward path it ought to follow. The same advantage will arise from the improved or novel processes brought to bear upon the working of precious metals. Every nation has its peculiar methods of casting, mounting, fitting up, and finishing, which have not escaped the attention of manufacturers and intelligent artisans. Gold-plating, silver-plating, the electro process, stamping, the imitations of gilding and silversmithing, maintain an important position in industry and commerce. The inferior metals or alloys, bronzed, silvered, or gilt, the imitation jewellery and artificial stones, are estimated according to their quality, and are largely used in European commerce, and as articles of export. The working of precious metals under their various forms is applied to objects of domestic use and sanitary purposes, and to the fine arts. In this respect, the Exhibition offers every advantage for the instruction of practical men, and of those who have a just appreciation of traditional taste and the demands of civilized society.

ELKINGTON, MASON, and Co., New Hall Street, Birmingham (1, p. 671). Messrs. Elkington and Mason are the first who introduced into England the application of the electro process to gilding and silvering. Their collection includes objects most varied in their forms and dimensions, intended for table service and for purposes of ornament, executed for the most part in copper, or in a compound metal alloyed with nickel, called German silver, and coated with silver by their electro process. The designs are generally produced in copper by the electrotype process, and afterwards wholly or partially gilt or silvered by means of electricity combined with the alkaline salts of gold and silver.

Several vases, such as copies of the cups from Heracleum and Pompeii, and various articles of ornament, are made entirely of pure silver deposited by the action of electricity. They are usually lined with wrought metal, either to give them regularity of form in the inside, or to render them fit for use. The Jury have particularly noticed, among the works of Messrs. Elkington and Mason, the beautiful group entirely of cast silver representing Queen Elizabeth on horseback, between a gentleman in waiting and a page, after a model executed by M. Jeannest, a French artist. This group is, in the opinion of the Jury, a very choice work of art: but they specially recommend for the Council Medal the large jewel-case of gilt and enamelled copper, ornamented with portraits upon porcelain of the Royal family, and with figures in full relief after designs by M. Gruner; and also the large circular plate called the Shield of the Amazons, a reverse copy of the original work, silvered and gilt in parts. These works of art and ornament offer the best specimens of the application of the electrotype process for the exact reproduction of objects in copper, and of precious metals to ornamental purposes.

The Jury, however, desire to guard against being considered as expressing an opinion on the merit of the application of the electro process of silver plating to objects of domestic use. They desire only to commend the artistic application of this discovery, to which alone they are inclined to think it adapted. At the same time they acknowledge that the application of gold by this process is a highly-meritorious invention, tending alike to the economy and durability of the metal applied, and to preserve the health of the artisan from the dangerous emanation of quicksilver vapours.

MOREL, J. V., and Co., 7 New Burlington Street, London, (117, p. 603), exhibit a small number of objects, the greater part of which are worthy of attention from the care and taste displayed in their execution. Among these are different pieces of plate for table-service, including a centre-piece in the style of Louis XV., executed with much care: a bouquet in rubies and diamonds of the first quality, representing a rose, a tulip, and a volubilis—this can be taken to pieces by a very ingenious contrivance, and transformed into a stomacher, head-dress, brooches, and bracelet; the rubies, which are of a very even colour, are set in bezels of gold:—a vase of silver gilt, ornamented with a silver bas-relief, the subject of which is a hunt amongst branches of oak, executed in the style of Albert Durer; the chasing of the bas-relief is admirable:—a silver-gilt sugar-basin, with cover, of faultless shape, and chased with ornaments in relief, very much deepened and of rare perfection. But the principal object of the Jury's approbation is the rich and handsome series of chalices and cups of various kinds in precious materials, ornamented with enamels, exhibited by Messrs. Morel and Co. They would instance especially a cup of Oriental agate, the gold mountings of which are composed of enamelled ornaments and birds of paradise: the pillar is ornamented with chimera in relief, enamelled, surrounding the escutcheon of H. I. H. the Hereditary Grand Duchess of Russia; and the foot is covered with beautiful arabesques enamelled: the taste displayed in this article is excellent, its composition is original, and it is very well executed after models by M. Méville. A nautilus shell of lapis-lazuli, supported by two enamelled figures of Tritons entwined with marine plants and flowers, and resting upon a rock covered with water and coral: the handle is, formed of a chimera ex-

quisitely enamelled, a copy of one on a celebrated cup in the Louvre: the manner in which this article is executed gives evidence of as much skill as taste: the model of the Tritons is the talented work of M. Constant Sévin. In the same rank must be placed another cup in Oriental agate, made in the form of a sea-shell (*plagiostoma*). The pillar is composed of a female figure, borne by a Triton with horse's fore-legs: at the back part of the shell is the handle of the cup, formed by another female figure sitting upon a dolphin and holding her flying drape, the extremities being supported by Cupids: all these figures are enamelled with superior taste. Two other vases in rock crystal also merit special mention. The first is a ewer with its dish of the same material, engraved with fine arabesques: this portion of the article is in the style of the sixteenth century: the mounting is copied from the celebrated ewer in the museum of the Louvre, the enamelled gold mountings of which have served as the model: this is a masterpiece of imitation, and has been executed by the order and under the direction of Mr. Webb, an enlightened lover of the fine arts. A vase, mounted in gold and enamel, is remarkable for the extreme delicacy of its carved enamel, and for the skilful execution of the figures and ornaments. Many other articles of the same description and of similar quality constitute a whole which the Jury regard as worthy of a Council Medal.

WEISHAUP, C. M., Sons, Hanau (Prussia, 412, p. 1073), exhibit a set of chess-men and board, the pieces in gold and silver, partly enamelled, and representing the Courts of Charles V. and of Francis I. They are entirely cast and nicely executed. The board exhibits superior qualities. It is made of silver, supported by four mermaids of silver gilt and enamelled in parts: from their shoulders hang garlands of enamel, ornamented with rubies and pearls, held up by gilt figures of children standing upon tortoises. Upon various parts of the garlands are placed herons of silver with blue enamelled wings. The squares of the chess-board are composed of mother-of-pearl and tortoiseshell. The whole is remarkable for its choice workmanship, and for the very skilful combination of silver with enamel and fine stones: the garland especially is executed in excellent taste, and must have presented considerable difficulties in mounting and enamelling. The Jury consider Messrs. Weishaupt deserving of a Council Medal for this happily-conceived and well-executed work.

GARRARD, B. and S., and Co, Pantion Street, Haymarket, London (98, pp. 683, 689), exhibit a collection of articles in precious metals and in jewellery, the *ensemble* of which is extremely rich, proving the immense extent of the manufacture of works in gold and silver in England.

There is, among the articles made in silver by Messrs. Garrard, a complete tea-service, consisting of seven pieces including the tray, in the Persian style, of very fine workmanship, the whole, with the exception of the small figures on the covers, made of silver in *repoussé* work. A table-candlestick with three branches, in the Queen Anne style, well conceived and very finely executed. A candlestick without branches, of a hexagonal shape, very well made, in *repoussé* work. A candelabrum with six branches, ornamented with foliage and fruit, of elegant design. A tea and coffee-service in *repoussé* work, with cast handles, which, though of a style rather undecided, is of very appropriate workmanship. Several other durable and well-made trays and tea-services. A large ewer for a race-cup, representing Hercules combating the horses of Diomedes, and surrounded by ornaments and emblems symbolical of the labours of Hercules. The handle represents the hydra of Lerna. This piece of plate, entirely cast, has a grand effect, and its *ensemble* gives it a real importance: the subject is well chosen, and the composition original. Several covered dishes, one of them of hexagonal shape, the others of the patterns known as the "bead and scroll" and the "bead and shell," show the care and solidity with which plate for the table is made in England.

Annexed is an abridged catalogue of the principal articles of jewellery exhibited by Messrs. Garrard:—

Necklace, stomacher, earrings and bracelet, in magnificent opals and brilliants, a noble and tasteful set:—a very rich set of magnificent sapphires, pearls, and brilliants:—a tiara enriched with fine oriental pearls and large brilliants of great purity; while a bracelet to accompany it,—an elegant gold bracelet of Gothic design, on which are chased out, upon a scroll-work of gold on blue enamel carved in the style of the fifteenth century, two angels holding a pearl and a ruby, and capable of being detached; the design by Mr. Smith:—a pearl necklace, with a circular medallion of rubies and brilliants, well made and in good taste:—a pendant in the Renaissance style, with figures in gold, rubies, brilliants, and pearls, upon green and red enamel, of fine workmanship:—a gold chased bracelet with a centre of emeralds and brilliants; the stones fine and pure, and the bracelet is well chased. Another bracelet of bright gold, its centre ornamented with rubies and brilliants in imitation of the sculptures of Nineveh, a curious and carefully-executed copy, singular for the great antiquity of the model from which it has been taken: several brooches and rings, of which fine and scarce stones are the principal ornaments. This exhibition, taken as a whole, indicates manufacturing capabilities of the highest order, and an attentive study of all that can conduce to progress in this branch of national industry; and for these reasons the Jury recommended Messrs. Garrard for the Council Medal.

HUNT and ROSKELL, 156 New Bond Street, London (97, pp. 687, 688).—The exhibition of Messrs. Hunt and Roskell presents an assemblage of articles of rare magnificence. The Jury, being required to point out those which they prefer, would direct attention to certain objects of special excellence, and particularly to some very beautiful bracelets, one in emeralds and diamonds; another in opal and emerald, with white enamel; a third, which has a charming effect, composed of a fine opal, surrounded by brilliants and small emeralds upon white enamel, with foliage of gold. The Jury also mention with praise a bouquet of diamonds, as rich as it is elegant; which can be entirely taken to pieces, even to the petals of the flowers, for the purpose of cleaning, and for forming into seven brooches; and which but for its weight would defy criticism. The Jury, however, prefer, among all the articles in Messrs. Hunt and Roskell's exhibition, the vase executed in *repoussé* silver by M. Vechte, which was shown several years ago in an exhibition at the Louvre, representing the fight between Jupiter and the giants. The deity, represented sitting upon his eagle, forms the cover of the vase: upon the body and handles are the giants endeavouring to scale the heavens, and hurling trees and rocks at Jupiter: at the foot lie allegorical figures in alto-relievo: other figures are engraved upon the ground of the vase in very low relief, with a matted background. The same artist, M. Vechte, has commenced for Messrs. Hunt and Roskell a large shield, in three oval compartments, representing the apotheosis of Milton, Newton, and Shakespeare. The Jury recommended a Council Medal to be awarded to Messrs. Hunt and Roskell for the Jupiter vase and for the bouquet of diamonds.

HANCOCK, C. F., 39 Bruton Street, Berkeley Square, London (112, p. 692).—The articles shown by this exhibitor are to be noticed, not for the large number displayed, but for their peculiar qualities considered in an artistic point of view. Mr. Hancock, while respecting the traditions of English art, has been desirous of introducing into it improvements of a special kind; and by the variety and versatility of style observable in his works, he seems to have attained this object. The principal articles are:—a round ebony table inlaid with silver, upon which is a silver vase in the form of an antique hydria with three handles, covered with palm-leaf ornaments and furnished foliage upon a matted ground; all the ornaments are made separately, and soldered to the vase, which is hammered out of a single plate; the table is inlaid with much care and taste; the feet are in German silver electroplated. Two groups for vase-pieces, in good taste, and carefully executed. The first represents Queen Elizabeth on horseback, accompanied by a page and a gentleman in waiting, with two greyhounds following, executed after a

model by M. Matteucci, the dogs after models by Mr. MacCarthy; the second, Robin Hood, contending for the archery prize in the shape of the shrub of Nottingham, after a drawing by M. Eugene Lamy. An ebony box mounted in silver, after drawings by M. Eugene Lamy, remarkable for its fine ensemble and for its silver mountings, and beautifully sculptured and of good effect, in the style of Louis XIV. Upon the lid is a large water-colour drawing, representing genii bearing the colours of the 79th Cameron Highlanders, to whom the box was presented by M. Demidoff; and on the inside of the lid is a fine water-colour drawing of the rock of Gibraltar. Several other articles exhibited by Mr. Hancock are worthy of being mentioned; such as the group in silver of a knight combating a dragon and a lion, after a model by Mr. MacCarthy: a dessert-plate, with knife, spoon, and fork, the whole ornamented with vine leaves, and wrought in silver carefully and gracefully; a good silver candlebrum, in the pointed style of Louis XIV., with five branches formed of acanthus leaves; and several other articles in the ornamental style for table use. The whole of Mr. Hancock's exhibition shows an accurate knowledge of the silversmith's craft, and of the resources which art can apply to this branch of industry when it is properly brought to bear upon it. The Jury are of opinion that on these grounds Mr. Hancock is deserving of the Council Medal.

MARREL BROTHERS, 27 Rue de Choiseul, Paris (331 France, p. 1194).—The principal article exhibited by Messrs. Marrel is the vase representing the combat of Theseus with the Amazons, after the celebrated picture by Rubens. This copy in alto-relievo of a picture as much noted for its composition as for the complex character of the scene represented, offered considerable difficulties to the artist, which he has surmounted with unquestionable success. The bas-relief is in bronze silvered: it is repeated upon the two sides, and fixed to the frieze of the vase. The vase itself is executed in bronze gilt, in the Louis XIV. style, and bears the arms of its owner, His Royal Highness the Duc d'Aumale; the handles represent Amazons upon sea-horses. A silver cup, in the Renaissance style, richly ornamented with figures;—another by the same artist, with medallions of bacchanalian figures, partly in *repoussé* work and partly chased and gilt;—another of silver gilt, inlaid with arabesques of blue enamel: these form but a portion of this remarkable collection. The Jury would further mention a very beautiful silver hunting-knife, the hilt of which represents St. Hubert standing within a niche: the cross is ornamented with a fox at bay, defending itself against several dogs: upon the chape of the sheath is a handsome bas-relief representing the conversion of St. Hubert, and lower down is a hunting trophy. The execution of this hunting-knife leaves nothing to be desired. The same maker shows some seals ornamented with beautiful little figures, office articles, scent-bottles in lapis lazuli, Venetian aventurine, jasper, enamels, snuff-boxes and other boxes of most varied styles and perfect workmanship, both in enamelling and chasing. Notwithstanding the merits of the other pieces, it is especially for this latter portion that the Jury recommended Messrs. Marrel for the Council Medal.

HUPOUR, J. F., 3 Rue Tronchet, Paris (1465 France, p. 1246).—The articles exhibited are of a most varied description: among others is a Byzantine casket in the form of a shrine; the portion of the lid forming the roof is ornamented with blue enamels, and the sides with other enamels of figures of angels upon golden and green backgrounds: upon the summit of the roof is a representation of the coronation of the Holy Virgin, accompanied by two angels, the whole in full relief, and made of silver gilt: the enamels are fine, and the casket ornamented with rock crystal, cut and set in coloured foil, has a remarkable effect. A bracelet of oxidised silver represents three children contending for some birds, which one of them is carrying off: M. Le Roi is the author of this beautiful design. Another bracelet in oxidised silver, from the design of M. Masson, represents two Cupids playing amongst the stalks of the vine, and holding up a sapphire, with four pearls in the form of a claw—very finely chased, and in good taste. A small group, formed of irregular

shaped vase, of two gentlemen in doublets fighting a duel with sword and dagger, has good action and distinctness of character, and is executed in a very pleasing manner: it serves for a paper-weight. The Jury also admired a large enameled plate representing the triumph of Amphibia, after a model by the late Wagner. A diamond oval casket, the cover ornamented with a female figure reclining upon a panther, entirely in silver, after a model by Geoffrey de Chausse. A round table of cast silver, composed of a hollowed flat plate, in the centre of which is the front face of the head of Minotaur, surrounded by Titans and Naiads, with Hylas and a Nymph: the hollowed portion and the border are ornamented with heads, birds, and foliage, after models by the late Wagner: the leg of the table is formed of the stem of a reed and foliage, ornamented with a kingfisher: upon the three claws are the bird's nest attacked by a rat, and intoxicated Minotaur Bacchantes, after the model of M. Geoffrey de Chausse, chased by M. Poux. The entire collection shown by this exhibitor appears to the Jury to be deserving of a Council Medal.

GUYTON, A., 11 Rue Chapon, Paris. (1619 France, pp. 1254, 1255).—The variety of objects exhibited by M. Guyton bespeak great fertility of invention and a felicitous application of old as well as novel processes. The Jury would mention particularly the History of the Horse represented on seven medallions upon a cup of cast and chased silver of very good shape. A cup of cast silver, partially gilt, representing subjects of the chase, and having at the bottom a medallion of Diana of Fontainebleau. A perfume-burner, with a garland of oak intermingled with objects of inanimate nature, its lid formed of a vulture. An oblong casket, the sides encrusted with rubies, and the lid ornamented with the figure of a Grecian female adjusting her earrings, while a Cupid holds her mirror: this piece is in cast silver, and chased in a very artistic manner. Several boxes and cigar-cases, ornamented with handsome bas-reliefs, in cast and chased silver, very light, or produced by the electro process in silver and also in copper silvered. A beautiful bouquet in alto-relievo, made in copper, and also silvered by the electro process. A group in cast silver of an Egyptian holding in a rearing horse, one-fourth the natural size. All these articles, especially those that are chased and those produced by the electro process, pertaining at once to works of jewellery and of the silversmith's art, give M. Guyton a very honorable position among the exhibitors, and have induced the Jury to recommend him for the Council Medal.

FROMENT-MEURICE, 52 Rue St. Honoré, Paris. (1720 France, p. 1253).—The articles exhibited by M. Froment-Meurice consist entirely of gold and silver smith's work, trinkets, and jewellery, artistically treated. Among them are to be remarked two elegant brooches in the Renaissance style, in rubies and opals, with brilliants arranged in the form of a string, one of them being very large, the other smaller. A beautiful bracelet, in the same style, in blue enamel, gold, and brilliants. A brooch, in the shape of a cross, in black enamel, having a sapphire in its centre, with branches and garlands of brilliants, upon which is a head with a body of pearl. The Pope's chalice, the ornamenting of which is at once elegant and novel, is executed with remarkable and appropriate taste. The toilet-table of Her Royal Highness the Duchess of Parma is a remarkable work, in which M. Froment-Meurice has overcome all the difficulties of the silversmith's and jeweller's art, in cast silver, repoussé work, enamelled and inlaid enamelled work, and engraved steel. But the attention of the Jury has been attracted by a centre-piece, representing Ceres, Bacchus, and Venus, standing upon the terrestrial globe, which is encircled by the zodiac, and around which by small figures in relief of the genii of Fleety, Music, and Concord. The globe is supported by male and female snake-footed giants, and rests upon a base decorated with ornaments and foliage. This piece, executed after models by M. Fouchère, is in style and execution such as in the estimation of the Jury merits a place in the first rank. It is entirely made in repoussé work, with the exception of the figures of the genii. It is sufficiently light to be easily portable; and the mount-

ing is so arranged that the principal portions may be taken asunder with ease, without in any way affecting its solidity. For this article the Jury decided upon recommending M. Froment-Meurice for the Council Medal.

WAGNER, EMIL, AUGUST ADAMER, Berlin. (240 France, p. 1096).—The Jury recommended for a Council Medal M. Wagner, the maker of a silver centre-piece for the table, having three stages one above another. The one forming the base consists of a plinth, supported by lions. Upon the plinth are represented figures of the human race in its primitive condition, seated and grouped at the foot of an oak tree, and accompanied by animals and implements characteristic of the chase, of pastoral life, and of fishing. Above these, three female figures, standing against the pillar, represent Agriculture, Horticulture, and the cultivation of the vine. These figures support a bowl, the sides of which are formed in repoussé work, and ornamented with numerous figures of children, or small genii of industry, the Sciences and the Arts, gracefully grouped, and forming very animated compositions. From the centre of this bowl rises a palm-tree, surmounted by a winged figure, representing the genius of civilization, and the subduer of evil, which is typified by an expiring hydra. The whole of this piece, with the exception of the bas-relief of the bowl, is cast and chased: the composition is entirely M. Wagner's. The figures of the genius, and the three females standing against the pillar, have been modelled by Professor Fischer. The repoussé bas-relief of the bowl, which is not quite finished, is M. Wagner's own work. The Jury recognise in this centre-piece a fine style, an exalted character, excellent sculpture, and good effect. The most studious care, united to extreme skill, has guided the execution of the whole of this work, which is worthy of the high position held by the arts in Germany, and worthy of the Exhibition it adorns.

The King of Prussia's shield. (98 Main Avenue).—His ROYAL HIGHNESS THE PRINCE OF WALES (p. 110), exhibits a shield, presented to him by the King of Prussia upon the anniversary of his christening. His Majesty furnished the general plan of the work: the drawings for it were designed by the celebrated painter Cornelius, the architectural ornaments are by M. Stüler, the modellings by M. Fisher, the goldsmith's work by M. Hossauer, the repoussé by M. Mertens, and the engraving of the stones by M. Calandrelli. In the centre is the head of Christ in gold alto-relievo, in a round concave medallion bordered by a wreath of acanthus leaves, which stand out upon a circle of blue enamel, with golden stars, the whole upon a large Greek cross, which is covered with the following gilt bas-reliefs: Justice, beneath which is a round medallion of St. Mark, surrounded by four chrysoptases; Prayer, beneath which is St. Matthew; Religion, with St. Luke beneath; and Charity, beneath which is St. John. Between the arms of the cross are four bas-reliefs, —Moses striking the rock, the Lord's Supper, the fall of manna, and the baptism of Christ. Around this cross is a frieze of blue enamel, ornamented with vines, with peacocks, and foliage of palm-leaves. Between these enamels are cameos upon German onyx, representing the twelve Apostles. The next circle is composed of oval-shaped ornaments of white enamel, between which are green cinque-foils with golden pearls, the mounting of which is golden foliage upon a background of white enamel with small green leaves, around which is a twisted border. The large bas-relief which surrounds the shield represents the entry of Christ into Jerusalem, Judas betraying Christ to the Pharisees, the burial of Christ, the Resurrection, the descent of the Holy Ghost upon the Apostles, and the birth of the Prince of Wales. Upon the next bas-relief is represented the arrival of the King of Prussia in England; his galley steered by angels, and propelled by a personification of steam; he is welcomed by St. George, by an allegorical representation of the Rhine, by the Duke of Wellington and by Prince Albert. The exterior edge is decorated with interlacings of white and green enamel, with buttons of flowered glass. Lastly, the concave edge is ornamented with inlaid enamel-work, in the form of a garland of fruits, grapes, and ears of corn.

This shield, worthy of remark for its composition, and

for the beauty of its sculpture, enamel, cameos, and settings, medals, in the opinion of the Jury, a Council Medal, as a reward for the talent of the artists, who have executed the orders and carried out the idea of the King of Prussia.

**SASIKOFF, IZAKCH, Moscow (386 Russia, p. 1384),** exhibits several articles in silver, consisting of vases of varied and original forms executed with much care: of very elegant statues in cast silver, especially one of a female figure reclining upon the brink of a well, and looking at her image reflected in the water; the cylinder of the well is hollow, and gilt inside, forming, when reversed, a drinking-cup; another work represents a female figure leaning against a cask and pouring out beer, a cat is shown climbing up the cask behind her; this piece forms a tasset, the cask serving to contain the liquid, the vase held by the female figure being the spout. These two compositions are perfectly original, and the workmanship is gracefully and carefully executed. The talent of M. Sasikoff is, however, especially displayed in a large centre-piece representing a fir-tree, at the foot of which the Grand Duke Dmitry Donaskoy, sitting wounded, is learning from his soldiers that he has gained the victory. The composition of this group is excellent: the chasing possesses great fullness, and is, at the same time, most carefully executed: the figures, fine in composition and superior in execution, possess a great degree of originality, and are arranged in a natural manner; and the character as well as the merit displayed in this group place it above anything hitherto produced in this description of manufacture. The Jury recommended a Council Medal for M. Sasikoff.

**KAEMMERER and ZEFFIGEN, St. Petersburg (376 Russia, p. 1384),** Jewellers to the Imperial Court of Russia, have exhibited a diadem wreath in imitation of the leaves and fruit of the bryony. The leaves are in diamonds, and the fruits in emeralds cut in very elongated pear-shaped forms. The different portions of this wreath can be taken apart and used separately: 2,836 rose-diamonds, 129 brilliants, and 12 emeralds, are contained in this beautiful ornament. Next is to be observed a "berthe" formed of bouquets of curfant-branches in diamonds, the fruit formed of polished uncut rubies suspended at different points upon a double string of diamonds, and arranged alternately with flowers in brilliants: its effect is excellent. The Jury have further remarked two other articles in the same collection, a bouquet of eglantine and lily of the valley entirely in brilliants and roses; also a brooch representing a branch of the ipomea in diamonds and beautiful turquoises. The importance of the articles in this collection, the superior taste in composition, and, above all, the perfection of the settings, not excelled by the works of any jeweller in the Exhibition, have induced the Jury to recommend that to Messrs. Kaemmerer and Zeffigen be awarded a Council Medal.

**LEMONNIER, G., 6 Place Vendôme, Paris (304, p. 1191).**—The collection exhibited by M. Lemonnier has constantly and justly attracted considerable attention. The qualities which eminently distinguish the jewels belonging to the Queen of Spain are a very decided and elevated taste in the composition, an imposing aspect, and great skill in giving effect to the materials at the disposal of the jeweller. M. Lemonnier has executed two sets of jewels for the Queen of Spain. The first consists of a diamond necklace in the form of a ribbon, interlaced with foliage of emeralds. The stomacher and shoulder-knots, from which are suspended very large emeralds with clusters of brilliants, are in the same style, and in them the jeweller has overcome considerable difficulties presented by the design. The bouquet is formed of lilies of brilliants, the leaves of emeralds and ribbons of brilliants, with pendants of pearl. The crown is in the same style, with aiguillettes in the form of flowers having stamens in pearl. The bracelet is likewise a ribbon of brilliants, interlaced with emeralds. The whole of this collection displays, in the great harmony and simplicity of its arrangement, much adroitness on the part of its inventor in making use of a profusion of precious stones without allowing their numerous number to mar the general effect. The same may be said of the set of jewels made in diamonds and sapphires,

also belonging to the Queen of Spain. The crown is composed in the heraldic style: in the centre of the diamond flowers is a sapphire; a beautiful wreath of brilliants accompanies the crown, with which the stomacher and the necklace match perfectly; upon them are flowers of brilliants with centres of sapphires with garlands and long-shaped pendants. The whole of this set presents an ensemble worthy of the talent of M. Lemonnier. It is impossible to speak of other articles of secondary importance to those just described, though they would elsewhere be deserving of notice. M. Lemonnier has thoroughly attained the end which should be kept in view in the execution of jewellery, to strike and gratify both the eye and the imagination. As a setter of stones he is excelled by many other jewellers; in point of invention and decoration he stands unrivalled in the Exhibition. The Jury recommended him a Council Medal.

**VITTOZ, G. T., 10 Rue des Filles du Calvaire, Paris (1520, p. 1250).**—The attention of the Jury has been attracted by the bronzes and the works in gilt bronze, exhibited by M. Vittoz. They can only speak of the bronzes which are either wholly or partially gilt, to which they are limited by their instructions. They have observed a clock in gilt bronze, called the "three hours of the day:" it is ornamented with Cupids upon a cloud, and supported by a pedestal of white marble. The Cupids are in bronze, and the style of Louis XVI. is preserved with much taste and care in the execution. The same clock is exhibited in double the size. A console candelabrum, in the Louis XIV. style, entirely in gilt bronze, is composed of three rich volutes springing from the foot, and entwined with garlands of oak, the whole supporting branches of lilies and mallows. This article is executed in remarkably good style, and the gilding has an excellent effect. A bronze figure of a child, of the size of life, bearing a basket from which issue fruits, flowers, and branches, gilt, presents a rich ensemble by the contrast of the bronze with the gold, and is of excellent workmanship. The group of children in bronze, half the size of nature, carrying bunches of grapes and resting upon a rich stand in gilt bronze, is, in the estimation of the Jury, the best piece in this collection so distinguished by the choice of models taken from the most skillful artists, and for execution with a care which no other maker has surpassed: the whole of the gilding is effected by the electro process, and appears to be executed in the best manner. The articles noticed claim from the Jury a recommendation for a Council Medal.

**MORATILLA, F., Madrid. (Spain, 261, p. 1345).**—It is to be regretted that Spain, a country renowned for its works in precious metals adapted for the purposes of Divine worship, should have sent but one article of this description to the Exhibition. The Jury have nevertheless seen, with satisfaction, the monstrance exhibited by M. Moratilla. This choice specimen of the silversmith's art stands about 6 feet 6 inches high: it is made of silver gilt, in the florid style of the fifteenth century. At the base are four bas-reliefs in silver, representing the Lord's Supper, Christ bearing His Cross, the Garden of Olives, and the entry into Jerusalem. Upon the platform are four figures in silver of angels in the attitude of prayer, their faces turned towards the octagonal base of the monstrance, the shaft of which is ornamented with figures of the four Evangelists in full relief beneath Gothic turrets. The monstrance itself is radiated in the form of a double wreath composed of vine branches, clusters, and brilliants. Surrounding it are fourteen stars or comets composed of brilliants, topazes, amethysts, and emeralds: the cross is composed of brilliants and amethysts. The ensemble of this large work presents a fine effect. The Jury have particularly remarked the regularity of adjustment of the various parts, so difficult to carry out properly in a work elongated in the form of a Gothic spire, and conceived in a style of architecture which demands this very regularity as an absolute condition of good execution. On these grounds, the Jury proposed that a Council Medal should be awarded to M. Moratilla; which being refused by the Council of Chaires, a Prize Medal was given.

**PAILLARD, V., 8 Rue St. Claude au Marais, Paris 2123**

(French, 1712, p. 1255), exhibits some bronzes which the Jury have examined with a great deal of interest; especially a beautiful figure of a child, of the size of life, crowned with vine branches, and holding a rich candelabrum of gilt bronze. It rests upon a three-fronted pedestal of gilt bronze, in Louis XIV.'s style, which has a fine effect. A large clock, with candelabra in gilt bronze, in the style of the latter part of the reign of Louis XIV. Two vases of porcelain, the backgrounds of which are of turquoise-blue with rich mountings of gilt bronze, composed of a grooved moulding around the neck of the vase, handles formed of infantine vintagers climbing upon a volute; beneath are heads of chimæras, from which a garland proceeds to the centre of the vase. Lastly, a pair of candlesticks, in the style of Louis XV., with twisted stems, the feet ornamented with escutcheons. It is principally as an artist in gilt bronze for room decorations, that M. Paillard has distinguished himself in the Exhibition; and it is on this account the Jury recommended him as deserving of a Council Medal, which having been refused by the Council of Chairmen, a Prize Medal was awarded.

The Jury award the Prize Medal to Messrs. WHEAT and SON, of Dublin (15, p. 675), for their brooches and trinkets in gold, copied with much taste, yet not servilely, from the antique fibulae found in Ireland; also for their necklaces, in which they have turned the almost forgotten style of the mediæval age to a very good account.

The Jury award the Prize Medal to LAMBERT and RAWLINGS, Coventry Street, London (103, p. 690), for their carefully-executed, elegant, and oval silversmith's work,—in particular, for a round flattened vase, with a long neck and a lid, in the Oriental style, the body and the neck ornamented with leaves, with gilt veins, and gilt and burnished bunches of grapes; also, for a centre vase, melon-shaped and flattened, having a long neck, the divisions of the side and the neck ornamented with thistles in bas-relief: the silver is of a beautiful dead brightness, which would appear to be very durable.

JOHN HARDMAN and Co., Mediæval Court (532, p. 701), exhibit a rich collection of articles for church use, in silver, and in silver gilt and enamelled. They have adopted the mediæval style. The workmanship is good, bold, and well defined. Two large closets contain the communion cups, crowns, monstrances, pyxes, and crucifixes; for which the Jury award them the Prize Medal. (Awarded a Council Medal by Jury of Class XXII.)

The jewellery and trinkets of ROWLANDS, C. and W., 146 Regent Street, London (118, p. 693), are remarkable for their fine execution, particularly a blue enamel brooch with a large polished and uncut garnet, two beautiful bracelets, and a brilliant and emerald stomacher. A Prize Medal is awarded for the carefulness and elegance of their workmanship.

CASEWYKE, T. J. and N., Sheffield (45, p. 680), exhibit articles important in size and of good taste. They are of plated silver, plated by the old process of uniting the metals by heat: the edges and mountings are of silver. The Jury have remarked among other things some plain candelabra, one of them of antique form, one of the style of Louis XIV., and another of the style of Louis XV. The workmanship of their dish-covers, teapots, and trays, is as carefully executed as this style requires, and perfectly adapted for long use. The Jury award Messrs. Casewyke the Prize Medal.

A Prize Medal is awarded to ANGELL, J., 10 Strand, London (111, pp. 691, 692), for his enamelled articles; especially a vase, vase with silver ground, dotted with burnished enamellings, and ornamented with turquoise-blue enamel; also another silver gilt vase, with vine-shaped handle, and burnished and engraved medallions, with enamel ground of green and turquoise blue and opal blue; a gilt bracelet, with a round medallion of gold, and turquoise blue and red enamel, the chain of which is very beautiful, and another bracelet in the Elizabethan style in gold, burnished and light-blue enamel.

DIXON and SONS, Sheffield (32, p. 679). These manufacturers have exhibited a collection of coffee, and tea, and chocolate, of British origin, an imperfect indication of the progress of the goldsmiths' art; as are all the compounds used for that purpose;

but the forms are as varied as they are well chosen, and might be very advantageously imitated for the same articles in silver: the workmanship is very good, and the Jury award the Prize Medal in consequence.

S. H. and D. GASS, 166 Regent Street, London (82, p. 693), exhibit an article of jewellery in the mediæval style, representing the figure of Britannia, the hand and hands of which are of silver, and the drapery of rubies and diamonds: it stands beneath a canopy supported by four columns of garnets with pendants of pearl. The art with which these precious stones are mounted appears to the Jury to be deserving of the Prize Medal, which they award to Messrs. Gass for their skillful workmanship.

J. KEITH, 59 Britannia Terrace, City Road (121, p. 694). The communion services exhibited by Mr. Keith are five in number, of silver gilt, and in the mediæval style, well engraved and enamelled. They are rewarded with a Prize Medal.

WATHERSTON and BROOKER, 16 Henrietta Street, Covent Garden (105, pp. 690, 691). The Jury have remarked as deserving of the Prize Medal a vase in the ancient style, entirely of gold, enamel, and precious stones. It is in the shape of a covered cup, surmounted by a group in gold representing England, Scotland, and Ireland. The body is a cylindrical bas-relief in gold, unfinished, the subject of which is the landing of the Romans, and the battle of Hastings. Upon the handles are the figures of St. George and St. Dunstan; beneath are two figures of Fame crowning the busts of Nelson, Wellington, Milton, Shakspeare, Newton, and Watt; and on the foot are the figures of Truth, Prudence, Industry, and Valour. The vase weighs 95 ounces; it is decorated with very varied ornaments in enamel, relieved by precious stones and diamond festoons.

J. B. DURHAM, 456 New Oxford Street. (Class XXI., 46, p. 593.) Amongst the articles made of steel submitted to their examination, the Jury have remarked a beautiful chateleine, entirely of wrought steel: it is composed of twelve pieces, adjusted with extreme care, and covered with faceted ornaments; several of the pieces, such as the étui, the key, the tablets, and the almanack, have required very long and skilful work, and twelve months were required to complete this chateleine. It was made entirely in London, and not a single piece of it was stamped. The Jury award Mr. Durham the Prize Medal.

HURLEY and SONS, Mount Street, Birmingham. (Class XXII., 305, p. 628.) The Jury likewise award the Prize Medal to these exhibitors for their chateaines, purses, ornaments, and buckles, made entirely of steel, and of very perfect workmanship.

LEUCHARS, W., 88 Piccadilly, London. (Class XXIX., 44, p. 791.) The silversmith's work in the dressing-cases of Mr. Leuchars is well made, elegant, and solid. A lady's dressing-case of walnut wood, mounted in the mediæval style, with pierced silver fittings, is particularly to be remarked. The Jury award Mr. Leuchars the Prize Medal.

Capt. L. L. BOWCRAWN JARRETSON, Clifton House, Old Brompton (Class XXX., 323, p. 841), has exhibited some very delicate objects, principally of natural history, botany, and entomology, which he has covered with a metallic coating, sufficiently thin to preserve their details, and of sufficient strength to admit of their being moulded in sand. The casts taken from objects thus prepared retain the exactness of the original, everything on which may be minutely traced by the aid of a magnifying glass. This process combines in its results economy of time and of expenditure with the most desirable accuracy. The Jury award the Prize Medal to its inventor.

M. S. MARSHALL, 21 John Street, Tottenham Court Road, London (Class XXIII., 104, p. 696), exhibits a collection of gold leaf of all colours. The specimens are fourteen in number. This article is used in various departments of industry. The gold of the same quality for the use of dentists has appeared in the Jury to combine all the desirable qualities of purity and malleability. Samples of plating, gilding, and other uses, in leaves of extreme thinness, show to how many different metals the processes of the goldsmiths' art may be applied.

The productions of Mr. Marshall combine all the conditions of evenness and perfection in the work. The Jury award him the Prize Medal.

WILD and ROBINSON, Oberstein. (Prussia, 889, p. 1097.) The manufacture of articles in onyx and agate, in their natural state or coloured of various hues by artificial processes, has become a large branch of industry at Oberstein. In the collection of Messrs. Wild and Robinson are to be remarked two very beautiful flower-vases of black onyx, coloured, with natural white veins; two large cups of red chalcedony, coloured; large square links of chalcedony, connected together without joints, and alternating in colour,—very curious as regards both the work and the material; also a very beautiful snuff-box of green jasper. This remarkable manufacture claims at the hands of the Jury the Prize Medal.

BRÄHMFIELD and GUTRUF, Hamburg. (54 Hamburg, p. 1188.) A silver inkstand is exhibited by Messrs. Brähmfield and Gutruf, in the shape of an oak, at the foot of which are a stag and a doe; near them are two trunks of trees, cut horizontally, serving for the ink-bottle and sand-box. This work, which is cast, is elegant and natural. The Jury award the Prize Medal.

G. F. HADLICK, Hannau (413 Prussia, p. 1073), exhibits a carnation in brilliants and rubies, with gold mountings enamelled green. This may also be used as a pin for the hair. It is planted in a small vase of turquoise blue enamel upon gold, with buttons of blue and red enamel, and gold lions' heads bearing garlands; the base is ornamented with green and red oval-shaped ornaments. The Prize Medal is awarded for the *ensemble* of this work.

STRUBE and SON, Leipzig. (23 Saxony, p. 1106.) A burnished silver vase, its body encircled by carnations, and containing a bouquet of fifteen silver flowers, executed with so much lightness that they appear as if they had been produced by the same process as artificial flowers. This bouquet is an original work of Messrs. Strube and Son, and the Jury deem it deserving of the Prize Medal.

THE ROYAL PRUSSIAN IRON FOUNDRY, Berlin (271 Prussia, p. 1064), has contributed a large vase and two candelabra of cast iron inlaid with silver. The vase represents Alexander's entry into Babylon, after Thorwaldsen, and the candelabra support groups of Amazons on horseback and on foot. Judging of these articles as specimens of inlaying with silver, they are deserving of the Prize Medal.

KULLER and Co., Oberstein. (888 Prussia, p. 1097.) The Jury award the Prize Medal to these exhibitors for their tea-service of coloured cornelian, consisting of two pots, a sugar-basin, twelve cups and saucers, twelve small plates, and twelve spoons; and for their jewel-cases in green moss-agate. The workmanship, the quality of these objects, and their unusual dimensions, are worthy of attention and approbation.

A. DATERTRE, Geneva. (319 Switzerland, p. 1280.) The watch-cases, some in enamel, some ornamented with gold and diamonds, and two engraved gold plates, have attracted the attention of the Jury, who admire the delicacy and correctness of their execution. The gold plates, one of which represents an incident in the life of William Tell, the other a tree with a landscape background, are engraved with extreme precision and delicacy by Mr. Fritz Kündert; the tree, in particular, is of workmanship which will bear the minutest examination with a magnifying-glass. The Jury award M. Datertre the Prize Medal.

P. H. GRANDJEAN, Serravallo, Chaux-de-Fonds, Neuchâtel (46 Switzerland, p. 1269), exhibits a gold plate, upon which he has engraved, on a very small scale, a forest, which appears to be copied from an engraving by Kolbe. Its execution is as fine as it is perfect, and has been awarded a Prize Medal.

A. DUBOIS, Chaux-de-Fonds, Neuchâtel. (43 Switzerland, p. 1269.) Another engraver, M. Dubois, exhibits a gold plate, representing ornamental objects of fruit and flowers, placed upon a console table, supported by Atlantes, the whole in the style of Lepautre, engraved so finely that the plate at the first glance resembles a photographic proof. The Jury award him the Prize Medal for this beautiful work.

L. A. GOLAZ, Serravallo, Geneva (320, p. 1280), has exhibited a small souvenir pocket-book, with cover engraved on white and green enamelled gold, with two medallions upon enamel, one of which represents two Italian women playing with a child, and the other a landscape after Calame. The perfection of these enamels and their beautiful effect merit a Prize Medal.

J. BENNATI, Genoa (59, p. 1304). The Jury award the Prize Medal to M. Bennati, manufacturer of silver filigree work, for a statuette of Christopher Columbus discovering a part of the globe by lifting up a yellowish covers it. Notwithstanding the boldness of the idea of executing such a subject in filigree, he has shown so much skill and taste in overcoming this difficulty, that his success is surprising, and attributable to the clever arrangement of imperceptible threads, imparting to the *ensemble* of the figure a firm at once *delicade* but correct.

J. LÖLLE, Genoa. (58 Sardinia, p. 1304). Another manufacturer of filigree, M. Lölle, has executed a column commemorative of the Exhibition, not very durable, but of very choice workmanship. The Jury attach more importance to the beautiful manufacture of trays, scent-boxes, *vidé-poches*, sugar-basin with tray, cigar-cases, fans, baskets, and garlands for ladies' head-dresses, which are of perfect execution, of very good taste, and have been rewarded with a Prize Medal.

H. RATZERADORFER, Vienna. (577 Austria, p. 1036). M. Ratzeradorfer exhibits a toilet-glass, the frame of which is entirely of massive silver, richly decorated with various ornaments, and with numerous groups and single figures. This frame, of elaborate and choice workmanship, merits, in the opinion of the Jury, the Prize Medal.

D. ROMAIN, Rotterdam. (104 Holland, p. 1148). The celebrated Dutch setters of precious stones are represented at the Exhibition by M. Romain alone, who has made a stomacher, consisting of a portrait painted in enamel and surrounded by a bouquet, capable of being divided into three parts, and very cleverly mounted in rose diamonds and pearls, for which a Prize Medal is awarded.

J. FALLOISE, Liège. (384 Belgium, p. 1163.) It is only a few years since the art of inlaying and damascening iron and copper has been revived in France, Spain, and Belgium. M. Falloise, of Liège, exhibits many different articles, to which he applies this description of decoration. Particularly worthy of remark are—a steel bracelet, with a bas-relief representing a Nereid in silver, with drapery of green and yellow shades of gold, mounted upon a dolphin, and standing out from the ground of inlaid steel in very high relief; two covered cups of copper (*patbes*) inlaid with silver, in the Oriental style; three vases, in the Renaissance style, ornamented on the tray and the stems with flowers, foliage, birds, and masks, inlaid in silver, in relief and engraved; a steel chalice, upon which are numerous tasteful ornaments in gold and silver, inlaid and engraved. These remarkable articles entitle their maker to the Prize Medal.

E. ZULOAGA, Madrid. (264 and 264A Spain, p. 1246) Don E. Zuloaga has exhibited arms, and a cover for a book, of iron and black oxidised steel, richly decorated with bas-reliefs and with damascened ornaments in gold and silver. The pistols, daggers, and sword are exactly of the same style as the book-cover; the latter, intended to contain a Castilian title of nobility, is ornamented on one side with figure-subjects, on the other side with *esquichens* and devices. The old Spanish models have served for patterns to all these works, in which the sculpture is deficient in grace and elegance, but its combination with a very beautiful damascening produces such a good effect, that artists are already engaged in copying the articles exhibited by Don E. Zuloaga, to whom the Jury award a Prize Medal.

JAHN and BOLIN, St. Petersburg. (222 Russia, p. 1277.) The Jury award a Prize Medal to Messrs. Jahn and Bolin, of St. Petersburg, for their beautiful exhibition of jewellery, as rich as it is perfectly set. Those especially worthy of notice are—A sparkling diadem, containing 11 very beautiful opals, 67 rubies, 1,814 brilliants, and 1,712 roses,—a bracelet of turquoises and diamonds, and a brooch, in the shape of a knot, composed of 754 turquoises,—with a pair of earrings of small turquoises, 709 in number. The settings of these latter

objects are almost invisible. The execution of the jewelry work cannot be better.

**DURAND**, 41 Rue du Bac, Paris. (1595 France, p. 1288.) A Prize Medal is awarded to M. Durand for a tea-service, consisting of seventeen pieces mounted in silver, forming a pile of silversmith's work, supporting four tea-pots, as many sugar-basins, cake-baskets, and milk-jugs, all in silver, partly oxidised. The silver tea-kettle is heated by a lamp. Around are four niches, with female figures; above the top, between the niches, there are figures of syrens; in the lower niches there are other female figures. Small Triton Atlases support the milk-jugs. The trays are inlaid with enamel, gilt and ornamented; the whole of the ground is in *repoussé* work, and richly ornamented. The models of the figures have been made by M. Klagmann. M. Durand exhibits besides a table centre-piece of silver, with infantine figures representing the four seasons, water and wine, in the style of Louis XV.; and a racing-cup, with subjects relating to tournaments and carousals in silver gilt, ordered by the late Duke of Orleans.

**ODIOT**, —, 26 Rue Basse du Rempart, Paris. (1671 France, p. 286.) The articles exhibited by M. Odiot consist of large and medium-sized pieces of silversmith's work in the English style, and of workmanship which this skillful silversmith deems best adapted to table-services. All the pieces are of silver, mostly cast, burnished, matted or engraved, and manufactured with care and solidity. The principal articles are—a large vase, with marine divinities, about 4 ft. 6 in. in height; the table-service of M. de la Bihoisière, all the covers of which are richly ornamented with sculpture of animals or of inanimate nature; an Arabian coffee-pot, with its *figuine* in burnished and gilt silver; a chestnut plate, representing a damask table-napkin; a coffee-pot and chocolate-pot ornamented with spiral groovings, burnished and beautifully executed; a table centre-piece, representing a wild boar at bay; a large candelabrum, with bacchic figures; fine specimens of knives, forks, and spoons, &c. The Jury award the Prize Medal to the exhibition of M. Odiot.

**CHARLES CHRISTOFFE and Co.**, 56 Rue de Bondy, Paris. (1862 France, p. 1251.) Messrs. Christoffe and Co., who are licensed to work the patent of Mr. Elkington, exhibit a valuable collection of silversmith's work in copper electro-plated with silver, of all sizes. The principles laid down, as to articles of every-day use being made of electro-plate, are applicable to all the exhibitors who have had recourse to this process, and the Jury can make no exception in favour of Messrs. Christoffe. They award the Prize Medal to the ornamental articles only which these manufacturers exhibit, such as a centre-piece representing Cupids fishing with a net around a group of trunks of trees, and candelabra, in the same style, of agreeable and animated sculpture.

**CONSTANT VALÈS**, 167 Rue St. Martin, Paris. (707 France, pp. 1212-13.) The Jury have noticed with satisfaction the artificial pearls exhibited by M. Constant Valès, who displays great skill in overcoming the difficulties of workmanship, and producing a superior imitation of natural pearls. They award to M. Constant Valès a Prize Medal.

**BOUILLONNET, HYVELIN, and Co.**, 46 Rue St. Avoys, Paris. (1197 France, p. 1231.) The articles exhibited consist of beautiful artificial stones tastefully set, amongst which a stomacher in diamonds, pearls, and emeralds is especially worthy of notice. These manufacturers make the materials themselves, and work for exportation. The Jury award them a Prize Medal.

**TANCY, E.**, 18 Rue du Petit Lion St. Sauveur, Paris. (1045 France, p. 1236.) M. Tancy confines himself especially to the manufacture of imitation pearls, and makes remarkable imitations of those called black pearls, for which the Jury award him the Prize Medal.

**F. DARRANGES**, 5 Rue Jean-Jacques Rousseau, Paris (1575 France, p. 1243), exhibits a collection of jewels, bracelets, chains, brooches, and especially of polychromic enamel, with metal and enamel ornaments,—a happy invention, well carried out, and for which the Jury award him a Prize Medal.

**M. BEVARD**, 28 Rue Saint-Gilles, Paris. (1475 France,

p. 1244.) This exhibitor cultivates a peculiar branch of manufacture, that of plating gold on red copper. In order to obtain it cheaply, his plates undergo a very accurate process of stamping in steel matrices, which are engraved with great accuracy; and they come out so perfect that they only require to be put together, which M. Bevard does with extreme skill. He exhibits miniature frames, bracelets, brooches, and the most delicate ornaments. The Jury award him a Prize Medal.

**SAVARY and MOSBACH**, 2 Rue Vancanson, Paris. (363 France, p. 1194.) The imitation stones of Messrs. Savary and Mosbach comprise samples of various descriptions, executed as well as possible, especially their imitation diamonds. The emeralds, and particularly the sapphires, are hardly so perfect, but hitherto manufacturers have been unable to attain perfection in this description of stones. The settings are in very good taste, and very carefully executed. The Jury award them a Prize Medal.

**F. A. THOURET**, 31 Place de la Bourse, Paris. (1702 France, p. 1257.) M. Thouret exhibits various articles of silversmith's work in copper electro-plated; but the Jury exclusively notice among the productions of this manufacturer the objects of art obtained from antique models with great exactness by means of the electrolytic process, such as the Cup of Fulda, and the one representing the Rape of the Sabines: perfectly clean moulds, taken in gesso from the originals, have served to reproduce these charming models in copper deposited by electricity; the deposits are beautiful, and are silvered and gilt. The Jury have also remarked a beautiful cover for a primer, produced by the electro process, ornamented with subjects from the Old and New Testaments, with superimposed medallions. The Prize Medal is awarded to M. Thouret.

**AUCOC**, —, sen., 6 Rue de la Paix, Paris. (1053 France, p. 1229.) The beautiful fittings for travelling cases, exhibited by M. Aucoc, containing very important articles of silver and silver-gilt worked in the English style, are worthy of particular notice, and have been awarded a Prize Medal.

**LEROLLE FRÈRES**, 1 Rue de la Chausée des Minimes, Paris. (1318 France, p. 1239.) The articles exhibited consist of bronzes, clocks, candelabra, groups and figures mostly gilt, and silvered in Paris. Their display of articles is considerable, and nothing which they have sent has been made for the occasion. The Jury, though observing in the productions of Messrs. Lerolle Frères a certain degree of negligence of style, deem them nevertheless deserving of the Prize Medal.

**MIRY FRÈRES**, 10 Rue d'Angoulême-du-Temple, Paris. (646 France, p. 1209.) A considerable assortment of decorative articles in zinc and alloys of common metals, bronzed, gilt, or silvered, constitutes the exhibition of Messrs. Miry Frères. This branch of industry places within the means of all classes, and at a very low price, ornaments of rich appearance, such as statuettes, candelabra, clocks, &c. &c.: the greater part of these figures are cast in reverse, the bronzing, gilding, and silvering, being obtained by the electro process, the effect of which is remarkable in this description of articles, wherein it is desirable to combine effect with economy. The Jury award them the Prize Medal.

**V. P. BOYER**, 38 Rue Saintonge, Paris. (70 France, p. 1175.) The Jury award the Prize Medal to M. Boyer for his bronze figures electro-gilt, in which the gold is very well employed, exhibiting fine, burnished, dead, yellow, and green gold in large surfaces, or in imitation of damascening.

**A. LACARRIÈRE**, 9 Rue Saint Elizabeth, Paris. (1564 France, p. 1238.) Amongst the imitations of precious metals there are two large candelabra in cast-iron, partly bronzed, and partly gilt with varnish, exhibited by M. Lacarrière. These candelabra, adapted for burning gas, of large size and very beautiful execution, are especially good imitations. The same manufacturer exhibits beautiful gas-fittings well put together, gilt by the same process as the candelabra, adapted very skilfully to ornamental purposes, and to the conveying of the gas. The Jury award M. Lacarrière the Prize Medal.

**F. VILLENEUVE**, 57 Rue Saint Avoys, Paris. (1707 France, p. 1258.) The principal gilt bronzes manufactured by M. Villeneuve are a tabernacle, having amulets on the

door and on the rose-work, in the Gothic style,—a ewer with tray, in which the carved work of the helmet and shield of Francis I. is introduced with great ability and judgment,—also two candelabra with branches, the bases of which are ornamented with the trophies of the Porte St. Denis, very ingeniously arranged and silvered. The Jury award the Prize Medal to this exhibitor.

**P. FOUCAULT-ROUSSEAU**, 84 Rue Cassette, Paris. (1405 France, p. 1245.) By devoting himself exclusively to the manufacture of church-plats, M. Foucault-Rousseau has become a master of this particular branch of art. He has availed himself of the best ancient and modern models: his large enamelled shrine, after designs of the Abbé Maistre, has a very beautiful effect, with the exception of the small engraved medallions: he exhibits also a bronze ewer gilt and enamelled, and silvered croziers richly ornamented with carving and enamel. The Jury award him the Prize Medal.

**P. J. LAHOUCHE**, 162 Palais National, Paris. (1287 France, p. 1236.) Among the articles exhibited by M. La Roche, the Jury have remarked a dark-blue porcelain clock, with mountings and Cupids in gilt bronze in the Louis XVI. style: a centre-piece for the table: a large oval basket of porcelain, of a light-blue ground, supported by Cupids with tails of fishes, and garlands having branches to hold candles; also the two candelabra vases which accompany it; finally, two dark-blue porcelain vases, with a very beautiful mounting in gilt bronze forming a garland. The Jury award this exhibitor the Prize Medal.

**L. D. J. AUDOT**, 81 Rue Richelieu, Paris. (11 France, p. 1170.) The beautiful fittings for the dressing-case of the Princess Wolkonski, manufactured by M. Audot, are of engraved silver, and of very good workmanship. The same exhibitor shows a very beautiful vase, with triple spout of reticulated silver highly finished of an interlaced form, the spout and handles gilt, with flowers and foliage in relief, and gilt in three colours. The fittings of another dressing-case are entirely of waved silver, inlaid with enamel and damascened, having a very good effect. These articles are deserving of the Prize Medal, which is awarded to M. Audot.

**C. S. MATIFAT**, 9 Rue de la Perle, Paris. (923 France, p. 1224.) As a manufacturer of gilt bronzes, M. Matifat has sought novel, varied, and elegant forms, and has been as careful in the execution as in the choice of his models. The Jury have remarked with pleasure the beautiful mounting of a large mosaic table: this mounting is entirely in gilt bronze, with heads of chimeras and lions' feet, of a solid design and very well chased. The clock, with a group of a female satyr and her child after Clodion, and the cup of old Sevres, with modern painting and beautiful mounting of bronze gilt, are objects particularized as deserving of the Prize Medal. (Awarded a Council Medal by Jury of Class XXII.)

**A. THOUVIN**, 44 Boulevard Beaumarchais, Paris. (696 France, p. 1212.) The Jury award the Prize Medal to M. Thouvin for his stamped brass furniture ornaments. The rough patterns of the articles exhibited are placed in juxtaposition with the finished samples, in order that the precision of the stamping may be appreciated. The finished ornaments are lacquered in a colour much resembling gold.

**A. R. PAYEN, junr.**, 18 Boulevard Saint Denis, Paris. (1674 France, p. 1257.) The jewellery is intended for exportation, and composed with much taste. This exhibitor makes silver work after the manner of the Indians, and employs to advantage numerous real pearls of small size. The Jury award a Prize Medal to the intelligent workmanship of M. Payen.

**J. AUBANEL**, 48 Rue de Trévise, Paris. (1035 France, p. 1227.) The articles exhibited by M. Aubanel consist of a rich chimney-piece in the Louis XIV. style, in gilt bronze. The two ends are occupied with vases filled with fruit; a light and gracefully-outlined arcade is placed in the middle, and surmounts an oblong vase, whilst it supports another in the shape of a church lamp, from which issued a garlands for seventeen candles. All the vases are of "grès" marble. The Jury, seeing much merit in this work, award M. Aubanel the Prize Medal.

**Lévy Frères et Co.**, 76 Rue des Fossés du Temple, Paris. (1395 France, p. 1206.) The workmanship of these exhibitors, without making pretensions to an elevated is

far above an ordinary character. They produce in their own manufactory all their gilt bronzes, which they use for the decoration of porcelain mounted by them with much propriety and richness. Turquoise-blue porcelain of subjects in the style of Watteau is exhibited; and the judicious manner in which it is mounted in highly-ornamented gilt bronze, deserves the Prize Medal awarded by the Jury.

**A. WEYGAND**, 108 Rue Vieille du Temple, Paris. (740 France, p. 1218.) The blue porcelain vases, mounted with gilt bronze, representing Syria, and the clock representing Agriculture, in gilt bronze and ivory, exhibited by M. Weygand, render him deserving of the Prize Medal. The work of these articles is generally in good taste: nevertheless the architecture of the pedestal of sea-green on which rests the statue of Agriculture, in itself presenting a beautiful combination of gold and ivory, is not satisfactory. The remainder of this collection contains some pretty figures in bronze, which the Jury regret it is not within their province to notice.

**A. CARON**, Passage de l'Opéra, Paris (1153 France, p. 1232), gunsmith, exhibits pistols very richly silvered, gilt, and damascened. The Jury award M. Caron the Prize Medal for this portion of his collection.

**MOUTIER LE PAGE**, 11 Rue Richelieu, Paris. (1364 France, p. 1241.) The Jury award a Prize Medal to M. Moutier le Page for a hunting-knife, the hilt of which is ornamented with a pommel representing an heraldic shield emblazoned with a lion in red enamel, accompanied by savages in coloured gold, terminating in foliage of another kind of gold, and armed with golden clubs with silver points; the shield is surmounted by a steel helmet with a rich wreath and crest. This work is executed in gold of various colours, inlaid to a great depth on a steel core, and is a specimen of the application of jewellers' work to side-arms.

**F. PRÉLAT**, #1 Rue de la Ferme des Mathurins, Paris. (1681 France, p. 1257.) The arms exhibited, particularly the pistols, are embellished with gold damascening, and gilt relief ornaments. The quality of his work entitles this exhibitor to a Prize Medal.

**L. A. BRUNEAU**, 40 Rue de Montmorency, Paris (1119 France, p. 1232), manufactures a variety of articles, such as flat purses, office-articles, boxes inlaid with enamel, pocket-companions, scent-bottles, cigar-cases, with representations of various subjects, cast, chased, and in repoussé work, or produced by the electro process. The exception is in keeping with all the objects, and M. Bruneau carries out with intelligence this eminently Parisian branch of commercial industry. The Jury award him a Prize Medal.

**— LEFAUCREUX**, 37 Rue Vivienne, Paris. (1308 France, p. 1232.) The Jury award a Prize Medal for this beautiful gold mounting of a carbine; for a double-screw plate for a gun, ornamented with dogs, inlaid and sculptured in gold, after models by M. Lecheune; and for the fine galvanic gilding of his weapons.

**— DESFONTAINES**, of the house of LENOIR et FILS, Palais National, Paris. (1186 France, p. 1234.) M. Desfontaines exhibits a clock and a set of ornaments for the chimney-piece, which present a novelty in the material employed for the sculptures. The bodies of the clock, and of the candelabra vases which accompany it, are of dark-blue porcelain; all the ornaments and fittings are executed in cast-iron, polished and damascened in gold. The clock is ornamented with a composition representing five knights struggling for the oriflamme, one of whom is unhorsed,—a very animated scene, and executed with talent. The candelabra vases are surmounted by a figure of St. Michael in armour, holding in his hand a drawn sword: on the handles are two knights combating with dragons; and the feet are formed of three lions, with bat's wings: this work, taken as a whole, the effect of which is highly satisfactory, must have presented great difficulties of execution, which M. Desfontaines has surmounted in a happy manner, while the judicious employment of the gold relieves the harsh colour of the cast-iron. The Jury award the Prize Medal.

The Jury of Class XXIII. make HONOURABLE MENTION of the following Exhibitors, their several claims to which are indicated after their names:—

**LISTER and Sons**, Newcastle-upon-Tyne. (27, p. 576.)

Silver plate for tea and coffee-service: a brooch in blue enamel with fleur-de-lis.

RAIM and SONS, Newcastle-upon-Tyne. (3, p. 673.) Silver plate for table-service, and candelabra.

M. McPHERSON, Perth. (46, p. 680.) A ram's head richly ornamented.

HARRIS and SONS, Aberdeen. (24, p. 675.) Bracelets of Aberdeen and Peterhead granites: Scotch jewellery.

MAHSHALL and SONS, Edinburgh. (23, p. 675.) Cup, chatelaine, and bracelets in agate.

CARTWRIGHT and HILSON, Birmingham. (30, p. 676.) Silver plate for the table.

H. and J. SEYMOUR, 40 Gerrard Street, Soho, London. (72, p. 682.) Portraits upon enamel of the Queen and Prince Albert.

HENRYS and CO., 2 Budge Row, London. (131, p. 694.) Imitations of diamonds, pearls, and precious stones.

MATTHEWS, 46 Berwick Street, Soho, London. (95, p. 686.) The Royal Arms of England engraved upon brass on a background of tin, in imitation of enamel.

E. NASH, 30 Coppie Row, Clerkenwell, London. (86, p. 683.) Snuff-boxes in dark tortoiseshell, inlaid with gold "de burgo" and "pique."

W. MOTT, 36 Cheapside, London. (116, p. 693.) Pencil-cases and pen-holders in various styles.

J. MAYER, 68, Lord Street, Liverpool. (14, pp. 674-75.) Nine enamelled gold brooch in the form of a knot of ribbon: a necklace in gold, formed of a chain-work of scales, with medallion with three emeralds and two brilliants.

S. WERTHEIMER, 35 Greek Street, Soho, London. (Class XXVI., 177, pp. 746-47.) A bronze casket, gilt, pierced, and stamped: an inkstand ornamented with slabs of painted china and with gilt mountings.

SMITH, NICHOLSON, and CO., Duke Street, Lincoln's Inn Fields, London. (110, p. 691.) Silver flower-stand.

H. ATTENBOROUGH, 19 Piccadilly, London. (113, pp. 692-93.) A plain tea-set gilt in the inside: a set of spoons and forks in the style called the Paxton pattern: bracelets in the form of a cross; one of them in brilliants upon gold and dark-blue enamel, the other in rubies upon diamonds and turquoise-blue enamel.

W. HAIRD, 72 Argyll Street, Glasgow. (26, p. 676.) Ram's head richly mounted, the ornaments being silver thistles.

H. WILKINSON and CO., Sheffield. (44, p. 680.) Large pieces of silver plate and table ornaments.

WIDDOWSON and VEALE, 73 Strand, London. (100, p. 690.) Rings mounted with fine stones: a bandeau of diamonds with an emerald in the centre: a green and red enamelled curb-chain necklace with pendants.

G. ANGELL, 51 Compton-street, Clerkenwell, London. (103, p. 690.) Vases in the Etruscan style, of various shapes.

G. R. COLLIS, Church Street, Birmingham. (34, p. 677.) Large silver waiters: tea-service gilt and burnished in the inside and engraved on the sides: a large chocolate-pot with outline ornaments.

F. ALLEN, Birmingham. (Class XXII., 293, p. 627.) Vases of red glass surrounded by filigree-work: bouquet of the same description of workmanship.

H. BISH, 13 Great Newport Street, Leicester Square, London. (79, p. 682.) A shield in enamel, representing the heraldic devices of the nations whose works are shown in the Exhibition.

MARTIN, BASKETT, and MARTIN, Cheltenham. (2, p. 673.) A chatelaine in gold and turquoise-blue enamel: a watch of turquoise-blue enamel and brilliants, with a chain of gold and enamel of the same colour.

W. and S. WATKINSON, 25 Dame Street, Dublin. (20, p. 675.) Brooches made from materials of Irish produce, and copied from the antiques of that country.

J. and F. BIRBY, 37 Cheapside, London. (51, pp. 680-81.) The engraving of animal bearings upon stones, for private and official seals.

C. GOODWIN. (24, p. 681.) Floodstone cup.

PHILLIPS LLOYD, 31 Cockspur Street, London. (87, p. 684.) Figurines in oxidised silver: pins and fancy jewellery in gold and silver.

G. W. ADAMS, Hosier Lane, London. (88, pp. 684-85.) Knives, forks, and spoons, of the pattern called Tudor.

MARMAUX and LECORAND, 14 Rue de la Paix, Paris. (333, p. 1193.) Stamped yellow copper for furniture decoration. (Awarded a Prize Medal by Jury of Class XXII.)

F. LAURENT, 5 Rue Chapon, Paris. (564, p. 1205.) Fittings for dressing-cases in waved silver. (Awarded a Prize Medal by Jury of Class XXIX.)

L. ROUVENAT, 62 Rue Hauteville, Paris. (1460, p. 1245.) Patterns of sword-hilts and mountings.

A. F. PICHARD, 26 Rue des Blancs Manteaux, Paris. (1388 France, p. 1242.) Imitation of gold and precious stones: brooches, bracelets, and flowers, made in imitation-diamonds with enamelled ribbon.

E. MAILLOT, 28 Rue Grenier Saint Lazare, Paris. (597 France, p. 1206.) Mountings for smelling-bottles.

J. B. MARCHANT, 57 Rue Michélieu, Paris. (607 France, p. 1207.) Chimney-ornaments in gilt and silvered bronze: military figures. (Awarded a Prize Medal by Jury of Class XXII.)

B. HOULLIER, 38 Rue de Cléry, Paris. (1628 France, p. 1255.) Damascus pistols inlaid with gold of various colours.

J. H. CORNILLON, 36 Rue du Temple, Paris. (95 France, p. 1166.) Scent-bottles for the toilette-table coated with copper by the electro process, and afterwards carved, engraved, and gilt.

DESJARDINS-LIEUX, 4 Passage St. Avoye, Paris. (1583 France, p. 1253.) Statuettes, bas-reliefs, and medals, in stamped silver and bronze.

DETACHE and HOUJIN, 158 and 160 Rue St. Martin, Paris. (1589 France, p. 1253.) Mountings of a large clock in gilt bronze, in the style of Louis XVI.

F. KRAMER, Strasbourg. (281 France, p. 1190.) Deer in a forest, in repoussé silver.

JUNGER JACON, widow of, Hanau. (409 Prussia, p. 1073.) Samples of enamels.

M. GOLDSCHMIDT and SON, Frankfurt-on-the-Maine. (20, 5 Zoll., p. 1122.) Set of jewels in gold, green enamel, and brilliants.

B. SCHREGER, Darmstadt. (51, Grand Duchy of Hesse.) Jewellery in oxidised silver.

G. I. HOFFMANN, Dantzic. (440 Prussia, p. 1075.) Yellow amber necklaces.

L. BOLZAU, Lemgo, Principality of Lippe. Mountings for meerschaum pipes.

G. E. JANTZEN, Stolp. (205 Prussia, p. 1059.) Necklaces, brooches, and articles for dressing-cases, in lemon-coloured amber.

L. GEISMAN and CO., Wiesbaden. (13 Nassau, p. 1132.) Brooches and lids for boxes, carved in ivory, with subjects of the chase. (Awarded a Prize Medal by Jury of Class XXVIII.)

WILLIAM BERGMANN, Warmbrunn, near Hirschberg, Silesia. (207 Prussia, p. 1059.) Brown rock-crystals cut.

C. WEBER, Mannheim. (325 Prussia, p. 1069.) A ring of Rhine pebble.

S. MERCIER, Geneva. (96 Switzerland, p. 1273.) Enamelled watch-cases. (Awarded a Prize Medal in Class Xn.)

J. E. RAUTTE and CO., Geneva. (236 Switzerland, p. 1281.) Paper-weight of enamelled gold, with mechanical singing-bird.

J. PATTON, Chaux-de-fonds, Neuchâtel. (44 Switzerland, p. 1269.) Plate of gold engraved with inscriptions in various characters.

H. GROHMANN, Prague. (576 Austria, p. 1086.) Bohemian garnets set in buttons; buckles, necklaces, smelling-bottles, and bracelet.

A. PORTELLI, Valletta, Malta. (25 Malta, p. 944.) Filigree-work.

E. CARTIER, Valletta, Malta. (24 Malta, pp. 944-45.) Filigree-work.

S. FALSON, Valletta, Malta. (25 Malta, p. 945.) Filigree-work.

B. G. MAMME, Portugal. (1022 Portugal, pp. 1316-17.) Set of amethysts in gold filigree-work, with earrings in the form of parasols placed one above another.

A. DE FRANCA, Portugal. (1022 to 1023 Portugal, p. 1317.) Snuff-box of silver, waved and engraved.

## CLASS XXIV.

### REPORT ON GLASS.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the  
OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

#### Jury.

Lord DE MAULEY, F.R.S., *Chairman and Reporter*, 21 St. James's Place.  
E. H. BALDOCK, M.P., *Deputy Chairman*, 5 Hyde Park Place.  
R. L. CHACEY, Glass Works, Birmingham; Glass Manufacturer.  
J. C. DUNCAN, United States; Barrister.  
\*JULIEN FRIMON, Belgium; Glass Manufacturer, Member of Chamber of Commerce at Charleroi.  
ROBERT ORDAIN, 2 Crescent, Blackfriars; Merchant.  
R. GENE PELLIOT, France; Professor at Museum of Arts and Sciences; Member of the Central Jury.  
Dr. SCHUTLER, Zollverein; Mining Councillor.

#### Associates.

GEO. BONTIMPA, at Messrs. Chance and Co.'s, Birmingham; Glass Manufacturer.  
Sir DAVID BRYMTER, Principal of the University, St. Andrews. Juror in Class A.  
JOSEPH CHATLER, 24 St. Dunstan's Hill, Tower Street; Window Glass Dealer.  
ALFRED B. DANIELL, 18 Wigmore Street; Flint Glass Dealer.  
W. MORTLOCK, 18 Regent Street; Flint Glass Dealer.  
PHILIP PALMER, 118 St. Martin's Lane; Window Glass Dealer.  
JAMES POWELL, 16 Temple Street, Whitefriars; Flint Glass Manufacturer.  
ANDREW ROSS, 2 Featherstone Buildings, Holborn; Optician.  
W. M. SWINBURNE, 43 Upper Thames Street; Plate and Crown Glass Manufacturer.  
CHAS. WINTON, 3 Harcourt Buildings, Temple; Barrister.  
THOMAS WOOD, 19 Greek Street, Soho; Plate Glass Silverer.  
LEONET ZUCCANI, Brick Lane, Spitalfields; Looking Glass Manufacturer.

\* Professor JULIUS CHANDLER, Proxy for M. Fison.

THE limits to which the Reports of the Juries must necessarily be confined will admit of a very brief and cursory sketch only of the rise and progress of this manufacture.

Its origin is uncertain, and has been ascribed by some of the writers of antiquity to accident. Josephus claims the discovery for the Israelites; Pliny assigns it to the Phœnicians, and states that the first glass-houses were erected in Tyre, where the only staple of the manufacture existed for many ages. Herodotus and Theophrastus likewise confirm the fact of the use of glass having been known in the earliest periods of civilization, and of the establishment of works for its fabrication in Egypt and Phœnicia, and even in India, where rock crystal was employed in its composition. It is mentioned in the book of Job, "Hast thou with him spread out the sky, which is strong, and as a molten looking-glass?" But possibly this expression may have been intended, in the original Hebrew, to refer to the metallic speculum.

The Egyptian philosophers had made chemistry their study, and attained to a very high degree of proficiency in that science. They involved it in the same mystery as they did their religious rites, and claimed for it from the people the same respect as for an institution of divine origin; and it is not surprising that they should have discovered in the prosecution of their researches, the simple process of vitrification, resulting from the action of intense heat upon siliceous particles, combined with alkaline salts; and that they should at once have perceived the facility of working the malleable substance thus produced, which possessed the quality of becoming hard and transparent as it gradually cooled.

This fact once established, their artistic skill, with the aid of science, could not fail of advancing another step, and of availing itself of the means of conveying form and colour to the shape, and of dealing with it for purposes of ornament and utility; as we see exhibited in the few beautiful remnants which have been brought to light in the excavations of modern times.

The process of manufacture, detailed by Pliny in the

curious and interesting chapter of his "Natural History" (lib. 36, cap. 25,) appears to have been very much the same as that practised at the present time; and Sir Gardner Wilkinson (vol. iii., page 89), gives the representation of two glass-blowers inflating a piece of molten metal, by means of hollow tubes; taking from a painting of Beni Hassen, executed during the reign of that monarch, who lived about 3,500 years ago, and adds, "That glass vases, if we may trust to the representations in the Theban paintings, are frequently shown to have been used for holding wine, as early as the Exodus, about 1,490 years before the Christian era." The remains of Alexander the Great are said by Suetonius and Strabo to have been delivered to Augustus, when he was in Egypt, in a glass case, in which Seleucus had deposited them after removing them from a golden urn.

This substance is supposed to have been used by Archimedes for scientific purposes, and an orb of glass is mentioned, as having been constructed by him, which gave rise to the epigram put into the mouth of Jupiter by Claudian—

Jupiter in parvo cum cerneret æthera vitro,  
Risit, et ad superos talia dicta dedit.  
Illeccius mortalis progressa potentia curæ;  
Jam meus in fragili luditur orbe labor!  
Jura poli, rerumque fidem, legesque virorum,  
Ecce Syracusius transtulit arte Senex!

There is in the British Museum a perfect and beautiful goblet, excavated by Captain Layard from among the ruins of Nineveh. It has a name (probably that of the contemporary sovereign, or of the maker) engraved upon it; and from the characters employed, and the locality in which it was found, it is believed to be of a date not less recent than seven centuries before the Christian era; and is probably the most ancient piece of manufactured glass in existence. The Barberini, commonly known as the Portland Vase, likewise in the British Museum, and broken a few years ago by a fool, or a madman, shows the perfection to which the art was carried at a somewhat later period.

The commercial intercourse of the Phœnicians and Egyptians with the islands of the Mediterranean, and with Ætulia, extended to them, and even to more remote regions, the use of this material. But it was not till the reduction of Egypt imparted to the Romans a more intimate knowledge of the arts practised in the conquered country, that the use of glass became general in Italy, and formed a very important article of commerce.

In the reign of Tiberius, works for the manufacture of glass were first established in the neighbourhood of Rome, and many instances are given by the writers of the day of the estimation in which it was held, and of the enormous sums occasionally paid for vases, or goblets of that substance, which were preferred by many to those made of the precious metals. It was employed by them not merely as an article of luxury in their feasts, or as an ornament in their palaces; but it served to decorate their altars, and for a pious offering in the tombs of the dead. Many fragments have been found in the catacombs, showing it to have been used likewise by the early Christians in their places of worship.

How far glass entered into the common purposes of domestic economy does not clearly appear; but it has been described as having been employed in the construction of hollow columns in the theatres, in which lamps were placed for the purpose of illumination; it was likewise used for incrustation of the walls of apartments, instead of marble; and to this use the expression "*vitreae camere*," employed by Pliny, has been thought to apply, whilst some commentators have considered that expression as referring to windows. But there is no positive authority for the use of glazed windows earlier than the close of the third century, when they are alluded to by Lactantius, who compares the researches of the mind with the operations of the eye, regarding external objects "*per fenestras lucenti vitro, aut lapide speculari obductas*." St. Jerome also mentions windows, formed of melted glass, cast into plates (A.D. 422).

A sheet of glass is said to have been found a few years ago in a window-frame at Pompeii, but the fact does not appear to be very well authenticated, and at all events it can only be one of very rare occurrence. After the removal of the seat of empire to Byzantium, the arts suffered amidst the disturbances and confusion which prevailed in Italy during the decline of the Western Empire. Constantine had assembled around him all that could tend to the cultivation of art, and the embellishment of his new city, and there still remain in the cabinets of our days some few specimens, showing the perfection to which the manufacture of glass was carried in his time, and that of his immediate successors.

Venice, according to her early writers, had been in possession of the art of glass-making almost as early as the foundation of the city itself; but the capture of Constantinople (1204), in which she took so great a part, and the extension of commerce which this event afforded her, induced her wealthy merchants to avail themselves of their increased relations with the East for the improvement of their domestic manufactures.

As early as the beginning of the 13th century, glass had been a subject of special attention to the Venetian government, and was regarded by them with so much care, as to have been, according to Carlo Mariuo, "*in ogni tempo considerata dal governo, qual pupilla degli occhi suoi*." The trade and manufacture of this article increased so rapidly as to require a large number of additional buildings for carrying it on, and great uneasiness was excited among the inhabitants, lest fire might accidentally occur among them. In 1291 they were in consequence removed from the city, and the island of Murano was assigned by the government for their reception. Considerable privileges were, at different times, accorded to the merchants of Murano, with the view of adding importance to their operations. A separate jurisdiction, independent of all the authorities of Venice, excepting the supreme council, was granted to them; and a *libro d'oro*, in which the most eminent members of their guild, or fraternity, were registered, placed them in a position equivalent to that of the nobles in a monarchical state. But, on the other hand, they were subject to very

stringent regulations. They were prohibited, under severe penalties, extending to their families, and even to their relations, and involving the loss of life and property, from conveying to any foreign country the secrets of the manufacture, or the materials employed; or even from affording their own individual services, by which the competition of foreigners with the trade of Venice might be promoted. An immense trade in beads, imitations of pearls and of precious stones, was carried on with the coasts of Asia and of Africa, and extended to India and to China; and continues by means of the commercial intercourse of England with these countries to the present day.

The revival of art in Italy had a beneficial effect on the manufactures of Venice, and improved the design and the colours of her produce. Her mirrors, her table-glass of variegated colours and spiral stems, her bottles and cups, obtained a very high reputation, and became the source from which the wants of Europe, Africa, and Asia continued for a time to be supplied.

But, in the 15th and 16th centuries, events occurred which greatly affected the prosperity of Venice. The passage to India and to China, round the Cape of Good Hope, and the discovery of America, changed the whole system of European commerce, and threw open to Portugal and to other States the advantages which Venice had almost exclusively enjoyed. England and Holland had forced their way into the Levant trade, up to that period monopolised by the Venetians and Genoese. The policy of Soliman, who, after the capture of Constantinople (1453), endeavoured to turn the commerce of the East into channels which he could control, or from which he could derive advantage; and the loss of Candia and of Cyprus, operated still further to the disadvantage of Venice. The mystery in which she involved all her transactions, and the severity of her fiscal arrangements, by which she endeavoured to preserve her monopoly, impeded her own progress, whilst her exclusive system excited a spirit of competition among her neighbours, which rendered them successful rivals; and her own commerce and manufactures, assailed and undermined in so many different quarters, were rapidly giving way.

Her trade in glass suffered with the rest; and Bohemia, Germany, France, the Netherlands, and England, derived advantage by the dissolution of the Venetian monopoly, by the improvement of their established manufactures, or by the introduction of a new process into their respective States; where, to this day, the works of the artists of Venice are still adopted as models of great beauty and skill, inferior only to the still more perfect productions of ancient Greece and Rome.

Bohemia was the first to emancipate herself from a state of commercial dependence upon Venice, and to resort to her own resources for her supply. Her forests afforded fuel and potash in abundance; siliceous and lime of excellent quality were to be found in the immediate neighbourhood of her existing works, and probably led, in the first instance, to the introduction of an improved system into that country; giving the manufacture an impulse which, combined with skilful manipulation, caused it to make rapid progress in the peculiar qualities requisite in the art.

The Bohemian proprietors having no other means of obtaining a return for those resources, which abounded on their estates, were induced to support the manufacture by their own exertions, and even to embark in the trade themselves. They have thus been enabled to bring into the market a beautiful article of commerce, and to compete successfully with countries possessing larger capitals, but where a higher price is paid for labour, and where many of the substances used in the manufacture require to be imported. The Venetian origin of their craft shows itself to this day in the reticulated pattern, the Eastern forms, the taper stem, and the variety of colours. Their colours, and engraving, and imitations of precious stones are likewise very beautiful; but at the best they are but an imitation of Venetian art.

Bohemian glass is a silicate of potash and lime, and has no lead in it. The manufacturers of that country make use of the same materials in the construction of the

metal, whether employed for window-glass or mirrors; with this exception, however, that for the last 25 years they have been using sulphate of soda, instead of potash, for making common window-glass. The same combination of materials prevails generally throughout Germany.

The manufacture of glass had probably been introduced into France at the same date as into Germany, and had been practised for common purposes from the earliest centuries of our era. Both countries derived their knowledge of it from the Romans; or probably from their commercial intercourse with the East, improved by the Romans, and still farther advanced in quality and artistic ornamentation, adopted from the Venetians. But it was not till a later period that France sought to increase the supply of her own demands, by paying greater attention to her manufactures at home.

As early as the fourteenth century, her government, with the view of inducing persons of education and capital to enter into the business, had declared that occupation to be in nowise incompatible with the dignity of the aristocracy, and decreed that none but gentlemen should venture to engage in any of its branches; and, as late as the latter part of the seventeenth century, the glass-blower might be seen laying aside his cocked hat, dress-coat, and sword, to prepare for the performance of his daily work. Other important privileges were granted to the manufacturers, and confirmed by a Royal Charter of Incorporation. But as education and capital became more generally diffused, these exclusive privileges were found to be injurious to the prosecution of trade, and have from time to time been modified; they still, however, remain in sufficient force to have an injurious effect upon the operations of the manufacturer and the merchant, and the convenience of the public. Privileges of this nature were no doubt intended for the promotion of trade, by holding out advantages to individuals disposed to apply their capital and industry in the pursuit. But the import duties, which afforded protection to the speculator, were likewise resorted to by the government, in order to assist the revenues of their States; and whether a sort of patent right were conceded to the speculators, or import duties were imposed for the purpose of checking foreign competition, the result was the same,—injury to the manufacturer, and inconvenience to the public. The fiscal regulations affecting glass in the reigns of James and Charles were of this character; and the excise and customs' duties in England, imposed at a later period, proved still more objectionable.

The first tax on glass was imposed 6 and 7 William and Mary, subjecting all glass wares manufactured in England, or imported from foreign ports, to a duty therein prescribed. It was shortly afterwards reduced to one-half; and in 10 and 11 William III. "it was totally repealed, being found to be vexatious, and troublesome in the levying and collecting, and of small advantage to the Crown, and, if continued, it would lessen the duty on coals employed in the manufacture, throw great numbers of poor out of work, and endanger the loss of a manufacture so beneficial to the kingdom."—*Parliamentary Reports*, 1835. In the latter part of the reign of George II. an attempt was made to renew the tax in a somewhat different form, but it was again found necessary to modify it. Several Acts were passed in the reign of George III., which not only added very considerably to the duties weighing upon the home manufacture, but likewise established regulations relating to the process of fabrication, the thickness and weight of the articles manufactured, and the powers and duties of the officers employed, which, in addition to the pressure of the tax, were particularly disadvantageous in a business "which necessarily depends for its success on the application of scientific principles to the various combinations of the materials, which are used, either as fluxes, or to form the basis of the product; and especially to the due regulation of heat, both as to its intensity and duration." A uniform system of regulation, prescribed by Act of Parliament, and executed by officers, who, however well meaning, were generally ignorant of the details of the business, could not fail of being vexatious, and of operating to the detriment of the manufacturer.

The 6 George IV. extended the duty to Ireland, the

immediate consequence of which was a great and general depression of the trade. The primary intention of the excise laws was to secure the due payment of the tax, and to establish checks both on the manufacturer and on the officers employed in levying the tax; but they likewise assisted one branch of the manufacture at the expense of another. For instance, a severe restriction was imposed on the bottle and crown-glass trade; the object of which restriction was to promote the use of flint-glass, which is prepared from much more costly materials, and was charged with a rate of duty much higher than that on bottle glass. The repeal of the excise laws removed the restriction, and was consequently more advantageous to the manufacturer of bottle and crown glass, than to the persons engaged in the manufacture of flint; as the former were thereby enabled to supply a much cheaper article than flint glass, for all those purposes in England to which this material is adapted, as is the case in those countries where excise regulations do not exist. The gobletterie on the Continent (including phials and small glasses) is usually made of crown-glass, and is much cheaper than in England, where the pressure of the tax impeded the manufacture; so much so, that in many instances in England bottle and crown glass were manufactured of such good quality, as to lead to the strong suspicion that their improvement must have been effected by the use of materials not authorized by law, and consequently not consistent with the protection afforded by that law to the flint-glass trade. But there were other provisions of the statute equally injurious, and which led to evasions in the highest degree disadvantageous to the legal trader, as well as to the revenue.

The most considerable advance in duty took place in 1812, and the immediate effect on consumption was as follows:—The annual average quantity of glass of all kinds, made for home use during the three years ending in 1812, was 413,414 cwt.; the average of the three following years ending in 1815, was 264,931 cwt., showing a decrease of about 35 per cent. in the quantity made. In the quantities retained for home use in 1793, when taxation was comparatively low, and in 1829, there was a decrease of 9,626 cwt., notwithstanding the great increase of population, and the advance of civilization made during the interval by all classes.

So much has been written on the subject of glass, that it would be merely a repetition of the able and interesting information given in the different Encyclopedias, and in the many treatises on the history and manufacture of glass, if in our Report we attempted to do more than briefly allude to the details of the manufacture. But it is important to bear in mind that the basis of all glass, at all times and in all countries, is the same—silica and alkali, two apparently opaque bodies, which by their fusion produce a transparent result.\* The alkali acts as a flux, and facilitates the vitrification of the earthy particles, which separately are unvitriifiable; and gives to them a pliability, when hot, which admits of their being blown, wrought, extended, and even hammered. It is remarkable that the glass found by Mr. Layard at Nineveh, now in the British Museum, bears the marks of having been turned, a process seldom attempted by the modern artists, though the application of the grinding tool, fixed on a lathe, approaches to the practice.

To the silica and alkali other substances are added, for the purpose of facilitating the flux and of purifying the metal, and imparting to it some peculiar quality or colour. Metallic oxides are employed for this purpose. The oxide of lead, in the form of minium, is principally used in flint-glass, and increases its brilliancy, the purity of its colour, and the power of its refraction. Manganese, formerly known as glass-makers' soap, is also in general use for the purpose of clearing the glass of all colouring matter. Its effect may probably be ascribed to the facility with which it gives up its oxygen, which combines with the colouring principles and destroys them. But, very great care must

\* Where sand is used, it is found, on examination with a microscope, to consist chiefly of small rough, rock crystals, which, by the action of alkali and fire, are aggregated and purified.

be taken lest the remedy, applied for the removal of one description of defect, should give rise to others of an opposite character. The presence of too much alkali attracts humidity, and (to use the glass-makers' phrase) disposes it to sweat. It also diminishes the refractive power of the glass, and when used in the state of undecomposed sulphate of soda, or potash, renders it opalescent. Lead in excess will produce equally bad effects: it will soften the substance of the glass, affect its clearness, and, in course of time, render the surface liable to be altered and decomposed. The importance of lead in this manufacture, whether in the form of litharge or of minium, which is obtained by oxidizing litharge, is so well understood in England, that very great attention is paid to its preparation, as well as to the quality of the lead: it is made an object of exclusive manufacture, and is one cause of the excellence of British flint-glass.

Borax, white arsenic, and nitre, are also useful, and powerful agents when well applied; but danger may arise from the employment of arsenic in vessels intended for domestic use. Borax, or borate of soda, is too expensive to admit of its being employed for common purposes. It is, therefore, far from being generally adopted, and is applied rarely even to objects of great importance. It was formerly imported from India, being a product of Thibet, but in a very impure condition; and a better sort in the form of boracic acid is now supplied from the works which M. de Lardereel has established at Monte Cerboli, near Volterra, in the Tuscan Maremma. Having ascertained the presence of large quantities of boracic acid in the district, he obtained a grant of land for a term of years from the Grand Duke, and immediately commenced operations. He began by diverting a stream to the spot where the boracic acid was found to abound; and after the water had become impregnated with the acid, it was allowed to flow on through pipes to large pans, for the purpose of evaporation. Volcanic heat likewise prevails in the same district, and in order to avoid the expense of fuel, which M. Lardereel found extremely high when he first undertook the works, he has availed himself of this volcanic agency, and conveyed the heat in tubes, so as to make it pass under the pans, by which means the evaporating process is effected, and the boracic acid remains in the pans.

Notwithstanding the facility afforded by this natural agent, the manufacturers complain of the high price of this substance, about 5*l.* 10*s.* the mutton-weight (205 English lbs.). The price is said to be regulated by a contract, made with some merchant at Leghorn; but it has the effect of excluding the material from the manufacture of glass for domestic purposes; and it is likewise to be observed that the Tuscan boracic acid, even at this price, contains nearly one-half its weight of water of crystallization; so that the glass manufacturer has to pay at the present day nearly 1*l.* per pound for the material in its available form as a flux. There are, also, other objections to its employment; for it is so extremely pungent that, unless applied with great caution, it corrodes the pots, introduces alumine into the fused metal, or passes away through the pores of the vessel.

It is said that this material has been found in abundance on the western coast of America, in combination with lime, as borate of lime; which, if correct, will be of essential service in many branches of manufacture. It is described, for the first time, by the American mineralogist, Hayes, and has been called *Hayessine*, from its discoverer. It is met with in the Peruvian province of Tarapaca, not far from the port of Iquique, in the same locality where the nitrate of soda, now so extensively exported to England, has been found. The borate of lime contains nearly 45 per cent. of boracic acid, combined with 19 per cent. of lime, and 35 per cent. of water, substances which cannot deteriorate its quality as a flux; whilst its moderate price, white colour, and absence of any metallic oxide, render it well suited to the use of the glass crucible.

The first chemists in England, France, and Germany have directed their attention to the fabrication of glass. Experiments have been tried by practical working men, with great liberality and intelligence; but there are cer-

tain principles dependent upon science, according to which all operations connected with the art must be directed. It is to the accuracy and judgment exercised in adhering to these principles, in providing for the selection and application of the component substances, in determining their proportions, and securing their purity and quality, in the working of the metal, the construction of the furnaces and the pots, in the management of the fires, and the annealing process, that we must look for the production of a good composition, and for improvement in the art of glass-making.

The siliceous matter mostly used in England is sea-sand, consisting chiefly of quartz. The finest qualities are obtained from Alum Bay, in the Isle of Wight, and from near Lynn, on the coast of Norfolk. Black flint, when raised to a red heat, and plunged in cold water, is frequently used, and probably gave the name to the species of glass, flint-glass, or crystal, to which it is most commonly applied.

The alkali used in this manufacture is either soda or potash, which is preferred for the finest works in the condition of the carbonate, and is then called carbonate of potash, or pearl-ash, from which the carbonic acid is expelled by the heat of the process in fusing. Soda is used as dry carbonate of soda, when a more than ordinary degree of whiteness is required, as in plate-glass. It is also used in this state in coloured glass. In window-glass (crown and sheet) soda is more generally used as a sulphate of soda.

Colour is imparted to glass by the application of the metallic oxides, and when it pervades the whole mass is termed pot-metal, as distinguished from that to which the colour is applied in the form of enamel.—(See Coloured Glass.)

Cobalt produces blue.

Manganese produces violet.

Antimony produces yellow.

Precipitate of cassius, or gold, produces pink.

Uranium produces opaline-greenish colour.

Chromium produces green.

Copper produces ruby, or greenish blue, according to its degree of oxidation.

Copper with iron produces ruby, or green, according to the degree of oxidation of the copper.

Silver produces a pure and beautiful yellow, but only by staining the surface at the fire of a muffle.

These colours, however, will be modified, or even completely altered, by different combinations of the metals, the degree of their oxidation, the greater or less degree of heat employed, the addition of vegetable carbonaceous matter, and other circumstances.

The manufacture of glass has been classed by the Commissioners under the following heads:—

#### A. Window-glass, including—

1. Crown-glass.
2. Sheet.
3. Brown plate, silvered or unsilvered.
4. Coloured sheet, pot-metal, or flashed.

#### B. Painted and other kinds of ornamental window-glass.

#### C. Cast plate-glass.

- Rough plate.
- Pressed plate.
- Rolled plate.

#### D. Bottle-glass, including—

- Ordinary bottles.
- Moulded bottles.
- Medicinal bottles.
- Water-pipes and tubing.

#### E. Glass for chemical and philosophical purposes.

- Matrass-retorts, &c., &c.
- Water-pipes and tubing.

#### F. Flint-glass, or crystal, with or without lead; white, coloured, ornamented, for table-vases, &c., &c.—

1. Blown.
2. Moulded and pressed.
3. Cut and engraved.
4. Reticulated and spun with a variety of colours; incrustated, flashed, enamelled of all colours,

opalescent, imitation of alabaster, gilt, platinised, silvered.

5. Glass mosaic, millefiori, Aventurine and Venetian glass weights.

6. Beads, imitation of pearls, &c.

7. Chandeliers, candlesticks, apparatus for lamps.

**G. Optical glass, flint and crown.**

1. Rough discs of flint and crown, to make lenses for telescopes, microscopes, daguerreotype and calotype apparatus, &c.

2. Flint and crown, blown, or cast in plates for the optician.

3. Thin glass for microscopes.

4. Refractive apparatus, prismatic lenses for light-houses.—(See also Class J.)

**SECTION A.—Window Glass, &c.**

It has been observed before, that some degree of uncertainty prevails respecting the period when this description of glass came into general use. It was at first regarded as an article of luxury and splendour, and appears to have been introduced into the churches of France about the sixth century. Fortunatus of Poitiers, who was contemporary with Gregory of Tours, mentions it in his Latin poems, as doing honour to the bishops of his day, by whose care the churches had been thus supplied with light, and embellished.

According to Bede, artificers skilled in making glass were invited into England by Abbot Benedict, in the seventh century; and the churches and monasteries of Wearmouth and Yarrow were glazed and adorned by his care. Wilfrid, Bishop of Worcester, about the same time, took similar steps for substituting glass in lieu of the heavy hutters which were then in use; and great astonishment was excited, and supernatural agency suspected, when the moon and stars were seen through a material which excluded the inclemency of the weather. York Cathedral was glazed about the same time; and in the eleventh and twelfth centuries, when a great stimulus was given to the erection of religious edifices, glass was generally employed in the windows.

It appears to have been used but very sparingly in domestic architecture till a much later period, when it came to be gradually adopted in the residences of the wealthy. As late as the middle of the sixteenth century, it was recommended, in a survey of the Duke of Northumberland's estates, that the glass of the windows should be taken down and laid by in safety, during the absence of the Duke and his family, and be replaced on their return, which would be attended with smaller cost than the repair rendered necessary by damage from weather or decay. In Ray's Itinerary, it is mentioned that in Scotland, even in 1661, the windows of ordinary houses were not glazed, and only those of the principal chambers of the King's palaces had glass; the lower ones being supplied with shutters, to admit light and air at pleasure.

The use of the diamond in glass-cutting, which only dates from the sixteenth century, greatly facilitated the manufacture.

There are two methods of making this description of glass:—

1. By the cylindrical process (sheet-glass).

2. By the effect of centrifugal force (crown-glass).

In the first, as soon as the fused metal is in a condition for working, a sufficient quantity is collected at the extremity of a pipe, and then lengthened by swinging, and blown at the same time, till it acquires the form of a hollow globe, or cylinder, open at one end, and adhering to the mouth of the tube at the other. The cylinder is then detached from the tube, the neck being cut off with a thread of hot glass, and one side of the cylinder is opened with a heated iron or diamond; after which, it is taken to the flattening kiln, in which it is heated to softness, and rubbed down, either upon a stone or upon a sheet of glass, called a large, by means of a block of wood, called a polisher. The sheet, thus obtained, is then placed in an annealing kiln, and left there to cool gradually.

By the second operation, the glass collected at the end

of the tube is made to assume the form of a flask, or rounded lump; and then, by a rapid rotary motion, the centrifugal force causes it to acquire the shape of a large circular sheet, about 50 inches in diameter. The thickness of this glass is nearly equal throughout, except at the knot or bullion, formed at the centre, where the rod or tube was attached to the metal.

The cylindrical process is the only one referred to by the monk Theophilus, as being in use in his time, whose work, entitled "*Diversorum Artium Secreta*," was written about the end of the twelfth or early in the thirteenth century.

This method was principally employed by the Venetians, and was found to possess the advantage of insuring uniformity of colour in coloured glasses, arising from the greater equality of their thickness. But as the demand for coloured glass diminished, the employment of the cylinders was entirely superseded in France, England, and the north of Germany, by that made on the rotary principle. It continued, however, to prevail in Bohemia, into which country it had been introduced from Venice, and was carried to so great a degree of perfection that when a glass of large dimensions and good colour was required in France, it was imported from Bohemia. In fact, the circular plates formed by the second process rarely exceeded 30 inches in diameter, and were of such unequal thickness that a square, exceeding 16 inches by 12, could not be cut from them.

This state of the manufacture continued till the beginning of the eighteenth century, when a French officer, struck with the superiority of the Bohemian glass, formed the project of introducing this method of fabrication into France. M. Drolenvaux formed a company for this purpose, brought workmen from Bohemia, and established a manufactory at Lettenbach, on the borders of Lorraine and Alsace, in 1730. They carried on their works with so much success, that being unable to purchase the land, which belonged to the monastery of St. Querin, they took it on lease for 100 years, and it was designated as the Manufactory of St. Querin. From this commencement have sprung all the factories, working glass on the cylindrical principle, in the Lyonnais, in the north of France, in Belgium, and latterly in England.

The first workmen, brought over from Bohemia, had been induced to leave their country by the offer of high wages, and fearing a diminution of the advantages which they enjoyed in the event of competition, they entered into a combination for confining the business exclusively to their own families. They constantly refused to allow strangers to be taken into the establishment in which they worked, or even to give them instruction; and if a master attempted to break through this regulation, the whole establishment would throw up their engagements, and leave him unprovided with workmen competent to carry on the business. They thus transmitted their occupation from father to son; and the names of Schmidt, Zeller, Theber, Walker, Stenger, Huy, Mayer, &c., employed in the manufactories of France, even at the present day, testify their German origin. A similar practice prevailed to a certain degree in England, where the glass-maker's trade is likewise a very exclusive one; and the benefit societies, of which the workmen frequently are members, render it exceedingly difficult for the masters, even if willing, to depart from ancient practice, and attempt amendments, which are looked upon by the workmen as prejudicial innovations. Another evil of a very serious nature has also arisen from this system of exclusion, which has been more particularly felt since the alteration of the excise and customs' duties. This measure, and the consequent reduction in the price of glass, have caused a great increase in the demand; and the supply of workmen in this country, properly educated and trained for the nice and difficult process required of them, is so limited; that the manufacturers have found themselves unable to execute the orders, from want of hands competent to carry them into execution. Consequently, they have been obliged to resort to the Continent, and to bring over workmen to assist in the works, which can only be accomplished by means of increased expense in wages.

The great advantage of sheet-glass, obtained by the

cylindrical process, is that of affording plates of larger dimensions, and of avoiding the waste arising from the circular form of the crown tables, and from the knob, or bull's-eye, in the middle, where the metal was attached to the table. But the surface is much less brilliant than that of crown-glass, and is more wavy and undulated.

The manufactories of glass in plates, in France, Belgium, and the north of Holland, where the style of building required panes of large size, were in consequence gradually abandoned; and towards the close of the last century, a manufactory of that description near Abbeville, in Normandy, one in Hanover, and two others near Aschaffenburg and Bamberg, were the last in which this process in the construction of window-glass was used.

#### *Crown-Glass.*

In England, on the contrary, the manufacture of glass in tables, under the name of crown-glass, had attained to so great perfection in the quality of the metal, workmanship, size, and exterior appearance, that this glass was generally adopted in glazing windows of houses of superior description; whilst the material known as spread-glass, or broad-glass, formerly manufactured in England on the cylindrical principle, was of inferior quality, and reserved for the poorer description of habitations. It is true, however, that the English spread-glass was not by any means so good as the German glass made upon that principle. The surface was uneven, very rough, and defective in brilliancy, which rendered it less well adapted than crown-glass to the purposes to which the latter was applied in this country.

This served to prejudice the public against all glass made upon the cylindrical principle; and it was not until the year 1832 that the manufacture of cylinder or sheet glass was introduced into this country upon the principle generally adopted upon the Continent.

It was then introduced by Messrs. Chance and Hartley, of Smethwick, near Birmingham, whose attention was specially called to the advantages attending this mode of manufacture by a visit paid in the year 1830 to the manufactory of M. Bontemps, of Choisy-le-Roi, near Paris. They were struck with the saving effected by the rectangular shape of the sheets of glass obtained by this process, and especially by the absence of the bull's-eye or knot in the centre, which rendered it impracticable to obtain, out of the tables of crown-glass, panes of greater superficial measurement than about one-third of that of the tables themselves; whereas, in sheet-glass, the panes could be obtained of the full size of the sheets blown, and the only limit to their dimensions was the strength of the workman; much greater facility being, moreover, afforded for accommodating the dimensions of the sheets to those of the frames required. Considering these advantages more than sufficient to counterbalance the disadvantage under which sheet-glass laboured in respect of evenness and brilliancy of surface, and taking into account the facility afforded by this process of manufacture for making glass shades (for covering clocks and other ornaments), which had hitherto been almost entirely imported from the Continent, and having secured the valuable co-operation of M. Bontemps, these gentlemen determined to commence the manufacture of sheet-glass, and started their first furnace in the autumn of 1832. They had, however, many difficulties to contend with, which it required all their energy and practical and commercial experience to overcome. The partnership was dissolved in 1836, and the following year Mr. Hartley established a manufactory for crown-glass at Sunderland. Not the least of these difficulties was the excise duty upon window-glass, which was at that time very heavy (amounting to at least 300 per cent. upon the cost of the glass itself), and being levied upon all the glass manufactured, whether good or bad, much enhanced the cost of experiments; and had it not fortunately happened that some advantage was allowed, in the shape of drawback, upon that portion of the glass which was exported, this obstacle might have proved insurmountable.

The waviness of the surface of this glass proved, as was anticipated, a great obstacle to its introduction for general glazing purposes, excepting in such cases as those

in which surface was of no moment, and strength the chief quality requisite; and it was not until the year 1838, when Messrs. Chance, Brothers, and Co. introduced a thicker description of sheet-glass, which was at the same time of a better surface, that its use can fairly be said to have become general. Since that time further improvements have been made, and the manufacture has gradually been adopted by other crown-glass manufacturers; and since the removal of the excise duty it has extended to such a degree that at the present time the weight of sheet-glass annually made is probably nearly equal to that of crown-glass, and it appears to be continually increasing. It is with this that the Crystal Palace was glazed at a very short notice.

The manufacture of broad or spread-glass was continued for many years after the introduction of sheet-glass, with which it was able to compete, in consequence of a difference in the rate of excise duty which was levied upon it; but this difference having been done away with in the year 1845, and the duty equalized with that upon sheet-glass, it could no longer sustain the competition, by reason of its inferior quality; and the manufacture was shortly after abandoned.

It was not so with the manufacture of glass shades, which, as before mentioned, was introduced at the same time, and by the same firm, as that of sheet-glass, and which has kept pace with it, and increased to a very great extent; and it has likewise undergone much improvement in the quality. The shapes have been adapted to the taste of the English; and shades are now produced of a larger size than were ever made on the Continent, to the almost entire exclusion of those of foreign manufacture, with which this market was supplied until the year 1832.

In the year 1840 a new variety of window-glass was introduced by Messrs. Chance, under the name of patent plate, which they obtained from sheet-glass by a new process of grinding and polishing. Many attempts had previously been made, both in this country and abroad, to attain this object; and small glasses for silvering purposes had long been manufactured in France and Germany by this means; but the great loss in thickness attending the process of grinding, hitherto adopted in those countries, which made it necessary to make use of sheet-glass of great thickness, and which, therefore, was necessarily limited in size, had hitherto proved an insurmountable obstacle to the production of any but thin and small plates, which were not suitable for glazing, and other purposes for which size and substance were requisite. By the invention of Mr. James Chance this obstacle was overcome; and it became practicable to manufacture plates of several degrees of thickness, and of sizes containing from 8 to 12 superficial feet. The surface of the glass obtained by this process, though not perfectly true, was very nearly so; and in brilliancy it was unsurpassed even by cast plate. This glass, consequently, soon became a formidable rival to crown, sheet, and cast plate, for glazing and for many other purposes; and since the removal of the excise duty, in 1845, the manufacture has greatly extended.

This improved process has, within the last few years, been introduced into France by Messrs. Patoux and Co., of Aniche; and has been successfully established, though upon a comparatively limited scale.

In Germany, the fabrication of blown glass, which was derived from Venice, has never been departed from, nor replaced by the use of cast plate. They are not, however, restricted to the production of the small glasses known in the trade as the Nuremberg glasses, and they have reached the dimensions of 84 by 42 inches, some of which are shown in the Exhibition; but there is reason to believe that blown glasses of such large dimensions are both more difficult of manufacture and more costly than when cast. A large capital, however, is required for the latter process. The Belgian window-glass has made very considerable progress, and enjoys a high reputation. A large quantity is made annually for exportation. M. Piron, of Dampremy, serving on this Jury, and Messrs. Benoit and Bivors, are carrying on business at their respective manufactories on an extensive scale, and the quality of their products is highly appreciated.

## SECTION B.

Painted and other kinds of ornamented window-glass have been assigned to this Section, but will be reported on elsewhere.

SECTION C.—*Cast Plate, Rough Plate, Pressed Plate, Rolled, &c.*

Notwithstanding the encouragement afforded to the manufacturers of glass of these descriptions in France, their progress does not seem to have been very rapid, until the ministry of Colbert, when some French artists who had been employed at Murano, and become thoroughly cognisant of the method of making blown plate-glass adopted in the Venetian manufactories, conceived the project of introducing the art into their own country.

They were taken up and warmly supported by Colbert during his ministry, and established works at Tourlaville, near Cherbourg, in 1688, in a situation resembling that of Murano, as nearly as possible, which they imagined to be calculated to promote the success of the enterprise.

We owe to Abraham Thévart, a working manufacturer, the process of casting the metal, ~~and~~ in the glass pots, which has effected so great an improvement in this branch of the manufacture: he at once perceived the advantage to be derived from it in producing glasses of larger dimensions and better construction. He made his proposals to the government, and, obtaining a patent, established his works in the Faubourg St. Antoine, at Paris, but shortly afterwards removed to St. Gobain, in Picardy. There he and his associates had to contend with much opposition on the part of the old company of Tourlaville; but in 1695 they endeavoured to reconcile their differences by uniting under a common charter of incorporation. This step, however, did not produce the desired effect, and the company were reduced to the greatest distress, when a new association was formed, under the management of Antoine D'Aguicourt, who laid the foundation of the magnificent establishment now existing there.

The company of St. Querin, which had been the first to make sheet-glass on the cylindrical principle in France, was not backward in adopting the great improvement in the manufacture suggested by Thévart; and combined the process of casting with their other works. Their lease from the monks of St. Querin expired in 1840, but long previous to that period they had taken the precaution of protecting themselves against the evils which might arise from the competition of a rival company at the expiration of their lease, and had formed another establishment at Cirey, in the neighbourhood of St. Querin, which, after the lapse of the term, merged in their more recent establishment at Cirey.

The two great manufactories of St. Gobain and Cirey, for a time, continued in opposition to one another; but a new enterprise entering the lists against them, the two long-established companies, without actually forming a partnership, entered into an agreement for their mutual advantage, and used a common dépôt for the sale of their produce, and for regulating the price in the different markets.

Another company established works at Montluçon about three years ago, and has sent some of their glass to the Exhibition. Their recent establishment does not afford them a large stock from which to select the best produce, but the colour of their glass is good; and if they can sustain the difficulties of a commencement, there is every reason to hope that, with time and encouragement, they will not fall short of the high reputation which so deservedly attaches to this branch of manufacture in France.

The manufacturers of St. Gobain and Cirey have sent to the exhibition three glasses of large dimensions (one of which is silvered, the others not so), pure in colour, excellent in structure, finish, and polish, and free from the globules and other defects which are so frequently met with in glass. In short, the produce of these manufactories, now exhibited, approaches as near to perfection in this branch of the manufacture as it can attain. They did not, however, reach their destination until the time had elapsed which had been finally fixed by the Commis-

sioners for the admission of objects claiming to compete for the Medals; and on learning that an uneasy feeling prevailed on the subject among those exhibitors who had sent in their glasses two months earlier, in accordance with the original directions of the Commissioners, and who contended that it would not be just that the French glasses, selected from a large store after the Directors had had the opportunity of examining those which had been so long in the Exhibition, should be placed on the same footing, the St. Gobain and Cirey exhibitors, with a moderation which did them honour, consented to withdraw from competition, and merely to exhibit their productions, without claiming the reward.

In England, plate-glass, for mirrors and coach-windows, had been introduced for the first time by the second Duke of Buckingham, who brought over workmen from Venice, and established a manufactory at Lambeth, where the works were carried on with success. The great improvement which had taken place in the process in France, and more, particularly the important inventions of Thévart, found their way to England; and the first manufactory for cast plate was established in 1773, at Ravenhead, near Prescot, in Lancashire, by a society of gentlemen, to whom a charter was granted, under the name of "The British Plate Glass Company," under which title they still enjoy a high reputation, though their firm, their capital, and their privileges, have undergone considerable alterations. When this company was first established, the only cast-plate manufactory was that in France, supported by the government; and all the processes of grinding and polishing were done by hand labour. In 1788 this company ordered of Messrs. Bolton and Watt, of Birmingham, a steam-engine, which is believed to have been the second ever erected; and in the following year they commenced the machinery for grinding and polishing. They were thus the first to introduce machinery for bringing their work to perfection, and the example was followed by all the other companies. It is remarkable that though many attempts have been made to improve the machinery, it remains, in all the manufactories, without any alteration of its principle. The glass produced by this company is tinged with a slightly-blue colour, which they attribute to the fact of their avoiding the use of the metallic oxides in their metal; and consider that this practice gives hardness, brilliancy, and transparency to their glass, and admits of a finer polish; and they assert that their glass is not liable to the change of colour which occurs when arsenic, lead, or manganese are employed. The glass which is exhibited by this company is placed in the Nave.

The establishment at South Shields, founded by the Cooksons, in 1728, likewise added the process of casting to their existing works. A very considerable business is now carried on there by their successors, the Messrs. Swinburne, who have supplied several large glasses for the decoration of the Building, and point out one in the furniture department, marked in the Catalogue No. 4, as a specimen of their manufacture. They have likewise exhibited a dome of opaque white glass, large tablets of glass, coloured in imitation of marble, and a great variety of other objects composed of plate glass.

The rough plate glass of Messrs. Hartley, of Sunderland, likewise belongs to this section. A great variety of articles are manufactured by them; but it is this useful product that they particularly specify as the object contributed by them to the Exhibition.

The Thames Plate Glass Company was established in 1835-6 at Blackwall, and have exhibited two glasses of very large dimensions.

Two others in Lancashire, and that at Smethwick, near Birmingham, have all been brought into existence within the last half-century, and considerably increased since the repeal of the excise laws. Their joint produce now exceeds two millions of square feet annually, which are used, first, in the shape of rough plates, for glazing, for roofing-in the railway stations, skylights, and other similar purposes; secondly, as polished glass, for shop windows, and large plates, for the windows of houses.

The process of casting is much the same as that employed by Thévart; but where manual labour was for-

merly used in the grinding and polishing, the use of machinery now assists the operation, and has led to a diminution in the cost of production, and consequently to increased consumption.

#### SECTION D.—*Bottle-Glass, Water Pipes, and Tubing.*

The manufacture of bottles is of very considerable importance, from the amount and value of its produce. In France alone, the trade is estimated at above 60 millions of bottles annually; and their value at more than half a million sterling. The earliest and one of the most important manufactories of this species of glass was established in 1994, at Quinquengrone, in Normandy.

The bottles used for the effervescing wines, and for containing certain acids, require very great care in their fabrication. In the former, it is necessary that the component parts should be thoroughly mixed, when the mass is in a state of fusion; and that the glass should be of equal thickness throughout, that in every part the bottle may be equally strong, and able to resist the pressure of the fixed air confined within.

The loss of bottles by bursting, in the champagne trade, is stated to amount to from 20 to 30 per cent.; and a machine has been invented for testing their strength, which ought to be equal to bear the pressure of from 25 to 35 atmospheres. The price of bottles for this purpose is generally nearly double that for ordinary purposes.

In bottles intended to contain acids, care should be taken to combine chemically the alkali and the lime, so as not to incur the risk of their being acted upon by the acid, and subjected to decomposition.

#### SECTION E.—*Glass for Chemical and Philosophical Purposes.*

The glass to which this section refers requires peculiar qualities, according to the purpose to which it is to be applied. Hardness, evaporation of the salts by a long-continued exposure to heat, but which cannot be effected without deteriorating the colour, are the most essential qualities for glass of this description; and will bring it under the heads, partly of bottle-glass, and partly of flint-glass.

Several other products, useful in the dairy, the farm, the garden, &c., may be referred to this section.

#### SECTION F.—*Flint-Glass, or Crystal, with or without Lead.*

The glass comprised in this section is derived from the remotest antiquity. Among the excavations which have been made in Egypt, Greece, Italy, &c., are found fragments of blown-glass, moulded, pressed, cut, engraved, mosaic, reticulated, &c., and adorned with cameos of the finest workmanship. Venice and Bohemia followed in the same branch, and were only surpassed by the substitution of a metallic oxide in the manufacture, and the production of a silicate of lead and potash, in lieu of the silicate of potash and lime to which they still adhere.

The first manufactory of flint-glass in England was established in the Savoy House, in the Strand, in 1552, and another in Crutched-Friars; but it was not till long afterwards that the great improvements which have brought it to its present state of perfection, by the use of minimum, or oxide of lead, and closed pots in the furnace, were introduced.

In 1635, Sir Robert Mansell obtained a patent for making glass of this description, in consideration of his undertaking to supply pit-coal, instead of wood, in his furnaces. He was also granted, on the same grounds, the exclusive right of importing drinking-glasses of fine quality from Venice, which were not made in England till half a century later.

The use of coal was soon found to affect the colour of the metal; closed pots were then used for the purpose of obviating the evil; but from their use arose another objection. The fusion did not take place in the closed pots so rapidly as when the metal was more immediately exposed to the action of the fire. A larger supply of alkali was required to assist the fusion, and the colour was still affected. This led to the adoption of a metallic flux, and the oxide of lead was applied in as large quantities as the fusion would bear without an alteration of

colour. This new process not only remedied the evil, but has been found to produce glass of the purest colour, most brilliant effect, and most perfect in quality of any yet made.

This method of fabrication was not so much required on the Continent as in England, wood being principally used as fuel in the furnaces. It was not till 1764 that the metallic oxide was introduced in a small factory at St. Cloud. It was afterwards removed to Mont Cenis, near Autun, which possessed the advantage of coal in the neighbourhood, and was known as the glass-works of the Queen, and continued its works till 1827.

Another manufactory of crystal, or silicate of lead, using wood fuel and open pots, was established in 1790, at St. Louis (Moselle). It has continued to carry on a very extensive business during the last thirty years, and only yields in importance to the glass-works of Baccarat, which were purchased in 1816 by M. D'Arctigne, whose works at Vonesch, near Namur, had become, by the Treaty of 1815, a part of the Belgian territory, and who preferred to carry on his business in his own country.

The coloured glasses of Bohemia, of which Count Harrach, Count Schafgotsch, and others, have exhibited very beautiful specimens, and their imitations in Germany, France, and England, are comprised in this section; and likewise the *mille-fiori* style of work, adopted for making presse-papiers and other ornaments, and sold by hundreds of thousands, which, by the extent of the trade, have become a very important branch of manufacture.

The description of glass referred to in this section sustains the high reputation which it has earned, and is ably supported in the Exhibition by the products exhibited by the Oslers, the Pollatts, the Powells, the Richardsons, and many other exhibitors. The American glass likewise is comprised in this section. It is a silicate of protoxide of lead, and is remarkable for the purity of its colour.

#### SECTION G.—*Optical Glass, Flint or Crown.*

The properties which are usually considered as constituting excellence in glass for ordinary purposes may easily be attained; but in glasses intended for optical instruments, and to be employed in the examination of objects so remote or so minute as to require the most undeviating accuracy, the difficulty of obtaining the metal sufficiently free from the defects to which glass is incident, had hitherto baffled every attempt to produce a lens, except of very small dimensions.

Purity, unchangeableness of colour, transparency, and a certain degree of refractive power may be obtained; but perfect uniformity in the structure of the glass, so as to render its composition absolutely homogeneous in all its parts, is not so easy to be accomplished; and it is precisely this quality which is the most indispensable in the manufacture of optical glass.

The great difficulty seems to occur in the difference of the specific gravity of the several constituents of the metal: some melt at a lower temperature, and sinking through the mixture, leave a streak or trail in descending; some evaporate or decompose in a heat required for the fusion of others; and different substances cool at different temperatures. Hence arise discoloration, sweating, threads, globules, striae, irregular crystallization, which cause irregular refraction by the interruption of the rays of light, and their deflection from the course which they ought to pursue.

The discovery of the achromatic telescope has been of the utmost importance in the science of astronomy. The first idea is due to Galileo; but Euler, in recent times, applying his mind to the investigation of the causes of frequent failure in the construction of the telescope, adverted to the perfection of the arrangement of the crystalline humours of the eye, bestowed by the bounty of Providence on man, which are so disposed as to provide for the variation in the different rays of light, and draw them to one focus; and he imagined that glasses of different media might, on the same principle, be so adapted to one another as to correct and regulate the dispersive powers of the different rays. But the experiment

tried on his principle did not meet with the success which he had expected.

In 1758, Jehn Dollond directed his attention to the same object; and, aided by the co-operation of Euler, and of Klingenstierna the Swedish mathematician, he succeeded, after a long series of experiments, in discovering the due proportions of the curvatures of the two lenses, of which the object-glass of the achromatic telescope is composed; the one being flint-glass (silicate of white lead and potash), the other, crown or plate (silicate of soda and lime), which, having different refractive and dispersive powers, may be so arranged, that while, by the combination of the two, the rays are brought to a focus, the greater dispersion of the flint lens may be corrected by the less dispersive power of the plate; the one being negative, the other positive. "The refractive power of the glass bends the rays of light falling upon, or rather entering its surface, according to a certain law, in which it proceeds through the medium, while the glass is of the same kind. The same occurs again when the ray, having passed through the lens, arrives at the other surface and passes into air, the ratio here being the inverse of the former."—*Encyc. Met.*

Hence arises the importance of avoiding any variation in the media of which the glass is composed; as the slightest difference would act as a disturbing cause to the progress of the ray of light in its due course, derange the refraction, and distort the object.

After this principle was attained, Dollond and the French and German opticians experienced extreme difficulty in procuring glass adapted to their purpose. The Academy of Sciences, at Paris, offered prizes in vain for this object. The celebrated chemists, Macquer Roux, of St. Gobain, and Anet, of Langres, devoted their attention to it in vain; and even when procured, 3 to 3½ inches in diameter was the largest size they could obtain.

M. d'Artigues, one of the first manufacturers of crystal (flint-glass) in France, and who to his high reputation for practical skill added that of scientific knowledge, equally failed, or produced insufficient results; and it remained for a man in no degree conversant with science, not a glassmaker by trade, nor distinguished by education, but endowed with extraordinary energy, spirit of inquiry, and perseverance, to have the honour of arriving at the solution of the difficulty.

Guinand des Brenets, near Neufchatel, a workman in the clock and watch trade, who had been accustomed to the fusing of metals in the prosecution of his business, observing that in the ordinary process the waving and the threads, which are frequently to be seen in glass, were removed by stirring and thoroughly mixing the metal by means of an iron bar, applied the same process to flint-glass, and combining it with close attention to the structure, after many attempts made during his leisure hours, succeeded in producing flint-glass perfectly free from striæ.

M. Utzschneider, of Munich, hearing the result of his experiments, on making further inquiry, proposed to him to join him and M. Fraunhofer in their establishment at Munich: he accepted the offer; and one of the largest glasses resulting from their experiments, the diameter of which is 9 inches, is now in the Observatory at Dombat.

Guinand returned to his own country, but not being a glass-maker by profession, he prosecuted his researches only at intervals. He had discovered the principle; he had earned a well-merited reputation in the world of science, and promoted the researches of others; but the results of his experiments had not attained so certainty in practice, and he had not overcome the difficulties in the fabrication of crown-glass, which requires the same perfection, and the same dimensions as the corresponding flint.

In the latter years of his life, Guinand entered into communication with the Astronomical Society of London, and sent over some discs of flint-glass, of which Messrs. Dollond, Herschel, and Pearson made a favourable report. The largest of these glasses was 6 inches in diameter; and it is remarkable, that in England, which had supplied the Continent with flint-glass, a disc of 6 inches should have been regarded as a rarity.

Soon after, a Commission, composed of Messrs. Herschel, Faraday, Dollond, and Roget, was instructed to pursue the inquiry as to the manufacture of flint-glass. Mr. Faraday took the lead, both in his own laboratory and at the glass-works of Messrs. Pellatt, and could not fail of arriving at important conclusions. He changed the principle of fabrication, and produced a borate of lead of remarkable purity. The Lords of the Treasury had found it advisable to make a relaxation of the Excise laws in favour of the Royal Society, or persons acting for scientific purposes under that body. But, notwithstanding this regulation, the interference of the officers; and the delay in obtaining the necessary licence, proved so onerous and inconvenient, as completely to shackle their proceedings, and preclude all attempt to improve by means of experiment: and the question as to the fabrication of flint-glass being actively pursued in France and Switzerland, the Commission ceased from its labours.

Shortly afterwards M. Guinand died, without leaving any information as to his process. But in Bavaria, the works in which he had taken part had been continued according to his system; and his wife and two sons had witnessed his experiments, and were desirous of availing themselves of their father's invention for their own advantage.

M. Bontemps, who had devoted much attention to the manufacture of glass generally, and particularly of such as is required for optical purposes, was introduced by M. Lerebours, of Paris, to one of the sons of Guinand, who was endeavouring to sell his father's secret in England, or in France. He formed an association with him, but did not succeed in arriving at any good result. The treaty was broken; but M. Bontemps, satisfied of the correctness of the principle if properly applied, continued the experiments at his works without excluding Guinand; and in 1828 they succeeded in producing good flint-glass, and discs of from 12 to 14 inches, and a large quantity of smaller sizes. From that time the manufacture may be considered to have been established on a regular system.

The widow of Guinand and her other son set up works in Switzerland upon the father's principles, and were succeeded by M. Dagnet, of Soleure, who has sent to the Exhibition some of his products of moderate size, and pure in colour (14-6 *et infra*); but they prove the difficulty of producing large discs, and confirm the belief that there are even more impediments in fabricating crown-glass of large size, than in making good crystal. In order to render it free from impurity, it becomes more difficult of manufacture, more liable to tension, and to accidents. It requires a higher temperature. By increasing the facility of fusion, the disposition to attract humidity, or to sweat, is increased. In rendering it too hard, the risk of crystallization, and imperfect vitrification in cooling, is incurred.

The insecurity in which political events in France involved the persons engaged in industrial pursuits, was experienced by M. Bontemps: he contended against it, however, till the year 1848; when, after attaining to a high degree of eminence and receiving the decorations which are awarded in that country to distinguished merit, he was induced to retire from the difficulties and dissensions which prevailed around him, and to accept the invitation of Messrs. Chance, Brothers, and Co., to unite with them in the attempt to improve the quality, and extend the utility of this important branch of manufacture. They have succeeded in producing discs of extraordinary dimensions in flint of 29 inches in diameter, weighing 2 cwt., and of crown-glass up to 20 inches. These discs appear to be pure in colour, good in structure, and exempt from those defects which tend to polarisation of light, &c., and were considered by the Jury of Class X., Sir David Brewster, Sir John Herschel, Lord Wrottesley, and others, to be so important, that they invited Messrs. Chance to submit their disc of flint to the operation of grinding, finishing, and other processes, necessary in order to ascertain the uniformity of its density throughout.\*

\* Since the above was written this remarkable disc has been subjected to the tests required in order to prove its

Mr. Ross, the celebrated optician of London, was the first to call attention to a defect, which may be detected by polarization of light; and there is no doubt but that many failures, which had occurred previously, were to be attributed to the absence of this searching test. A glass, exceeding only the small diameter of 6 inches, undergoes the annealing process with difficulty, and is liable to cool at the surface more rapidly, than in the interior; and this tendency increases with the size, which renders the production of a disc of 29 inches a very remarkable work.

In this section are comprised the optical glasses of M. Maës, of Clichy, which have been distinguished by the award of a Council Medal (see p. 532), and likewise the annular lenses and cylindric refractors, which are applied in the construction of lighthouses, according to the principle introduced by Augustin Fresnel. Buffon in the last century, and Sir David Brewster in our own times, had recognized the advantage resulting from the arrangement of lenses in separate pieces, having a common focus. Fresnel, without being aware of the exertions made by Sir David on the subject, submitted, in 1822, to the French Commission on Lighthouses, a plan for substituting, along the coast, lights on this principle, and introducing the refracting apparatus instead of the metallic reflectors then in use.

In 1834, Mr. Alan Stevenson was sent to France, to compare the lenticular apparatus with the paraboloidal mirrors in use in our lighthouses, and to report on the comparative merits of the dioptric and catoptric systems. The result has been the gradual introduction of lights on Fresnel's principle into our lighthouses, under the direction of the Commissioners of Northern Lights, and Mr. Stevenson's superintendence. The Commissioners have exhibited in the North-western Gallery some small lights (we presume) as models of those in course of adoption.

Two sets of lights have likewise been constructed on a larger scale, of which one is exhibited by Messrs. Chance, another by Mr. Wilkins, of London. The latter is an apparatus containing the fixed light, varied with flashes, invented by Fresnel. The glass of which it is constructed was made at St. Gobain, and wrought in Paris by M. Letourneau. It is white, and appears to be of good quality; and if it is found not to be liable to humidity, the colour is certainly much in its favour.

The apparatus contributed to the Exhibition by Messrs. Chance was constructed at their manufactory, under the superintendence of M. Talbouret, formerly employed in the department of the Ponts et Chaussées in France, who, after thirty years of practice under that Board, had accepted the invitation of Messrs. Chance to direct the manufacture of the dioptric lighthouse apparatus, which they were desirous of establishing at their works. They have exhibited a dioptric apparatus of the first order, with revolving lenses and catadioptric zones, constructed on the principle of Fresnel. The upper and lower parts of the apparatus consist of a series of prismatic rings, each of which reflects, at the internal surface of its base, the incident rays of light. The advantage of this mode of reflection over the ordinary system of opaque reflectors consists in its saving a considerable loss of light, and being less liable to imperfection of surface. The middle portion of the apparatus is refracting, and produces by its revolution a succession of flashes or blades of light, which may enable the mariner to distinguish any particular lighthouse. The revolving part consists of eight annular lenses. Each of these lenses is composed of a number of concentric rings round a central lens, so as to produce all the refractive effect of a single solid lens of corresponding dimensions, but with less loss of light. A more perfect optical figure is moreover given to these compound lenses than to a single piece of glass, spherical aberration being in some measure corrected, and lenses of larger size may thus be formed than could otherwise be practicable. The glass used in the apparatus now in the course of adoption in the lighthouses on the coast of Scotland is made in France, and it has been alleged that it is liable to attract

moisture or "sweat," and consequently to lose a portion of its brightness. But the French manufacturers deny the charge; and when the judgment and care manifested in the execution of these important works are taken into consideration, a strong presumption is afforded that the Commissioners and Mr. Stevenson as yet find the French glass the best adapted for the purpose. But, supposing the contrary opinion to be correct, it only opens to the British manufacturer a fair field for competition, in which we have no doubt of his being successful. Messrs. Chance have acted upon this principle: they have made a first experiment with the view of promoting this branch of the manufacture of glass in England; but in order to avoid the defect of sweating, they have, perhaps, gone into the other extreme, and though the glass of their lights is good in quality, the measures taken to expel the salts in its composition, which render it liable to this objection, have affected the colour, and given it a green tint, which is considered by competent judges to be objectionable.

The question of lighthouses does not properly come within the scope of this Jury; but having been called upon to advert to the apparatus in the Exhibition, of which the glass forms so material a part, we cannot quit the subject without briefly noticing some of the progressive improvements which have taken place in this department of the public service. The first, or most magnificent work in modern times was the Tour de Corduan, founded in 1584 on an extensive reef at the mouth of the Garonne, but not finished till 1610. Wood and afterwards coal afforded the first light. In 1780, M. Lenoir was employed to substitute paraboloidal reflectors and lamps, and in 1822 the dioptric apparatus of Fresnel was introduced.

The Eddystone,  $9\frac{1}{2}$  miles from the Ram's Head, on the coast of Cornwall, was erected of timber by Winstanley in 1696-98, and washed away in 1703. It was rebuilt by Rudyard in 1706, and destroyed by fire in 1755. The present edifice was erected by Smeaton in 1757-59. Tallow candles were used in the first instance for the lights. In 1807 argand burners and paraboloidal reflectors of silvered copper were substituted.

The Bell Rock Lighthouse, commanding the line of approach to the Firths of Forth and Tay, constructed of stone by Mr. Robert Stevenson in 1807-10, is too well known, and reflects too much honour on his name, to require any further notice.

The most remarkable work on the coast of Ireland is that of Carlingford, near Cranfield Point, erected in 1830.

The Skerryvore Rocks, about twelve miles south-west of Tyree, off the coast of Argyllshire, lying in the track of the shipping of Liverpool and of the Clyde, had long been regarded with dread by the mariners frequenting those seas. The extreme difficulty of the position, exposed to the unbroken force of the Atlantic Ocean, had alone deterred the Commissioners of Northern Lights from the attempt to place a light upon this dangerous spot; but in 1834 they caused the reef to be surveyed, and in 1838, Mr. Alan Stevenson, their engineer, inheriting his father's energy and scientific skill, commenced his operations on a site from which "nothing could be seen for miles around but white foaming breakers, and nothing could be heard but howling winds and the lashing of the waves." His design was an adaptation of Smeaton's tower of the Eddystone to the peculiar situation—a circumstance with which he had to contend. He established a circular base 42 feet in diameter, rising in a solid mass of gneiss or granite, but diminishing in diameter to the height of 26 feet, and presenting an even, concave surface all around to the action of the waves. Immediately above this level the walls are 9.58 feet thick, diminishing in thickness as the tower rises to its highest elevation, where the walls are reduced to 2 feet in thickness, and the diameter to 16 feet. The tower is built of granite from the islands of Tyree and Mull, and its height from the base is 138 feet 6 inches. In the intervals left by the thickness of the walls are the stairs, a space for the necessary supply of stores, and a not uncomfortable habitation for the three attendants. The

quality: and its merit has been so satisfactorily established as to justify the Jury of Class X. in recommending that a Council Medal be awarded to the manufacturers. •

rest of the establishment, stores, &c., are kept at the depot in the island of Tyree. The light of the Skerryvore is revolving, and is produced by the revolution of eight annular lenses around a central lamp, and belongs to the first order of dioptric lights in the system of Fresnel, and may be seen from a vessel's deck at a distance of 18 miles.\* An arrangement of apparatus of considerable importance has been suggested by Mr. Thomas Stevenson, whereby true lenticular action may be extended by the adoption of total reflection for that end. By this arrangement, combined with the use of spherical mirrors, he has been enabled to use all the light of a lamp, and he has therefore termed it a holophotal system. Much has been done of late by the English, the Scotch, and the Irish Boards for the improvement of the lighthouse system; but the interests of commerce and of humanity require that much more should be done,—as the funds set apart for this object will permit,—in order to afford still greater security to vessels approaching our coasts; and we trust that the British manufacturers will not be slow in availing themselves of the opportunity of supplying a material of the very best quality for this important object.

In a sketch of this nature, it is for obvious reasons extremely desirable to avoid anything like a comparison between the products of different countries or different individuals; but it manifestly comes within the scope of our duty to give a brief account of the rise and present position of the principal establishments which have contributed their productions to the Exhibition; and to take a general view of the state of the manufacture in those countries, which have, at expense and inconvenience to themselves, intrusted their property to our care, and confided in our impartiality and justice in determining to the best of our ability their respective merits.

In the progress of this undertaking, we have felt an increasing sense of the importance of the subject, and of the responsibility arising out of the task. We have felt that the contributors might reasonably desire a more detailed description of the products which they have contributed to the Exhibition, and of the art to which they have applied their intellect, their resources, and their industry. But our limits are necessarily restricted within narrow bounds, and we fear that we have already trespassed upon the Commissioners and the public, further than the object, intended in calling for Reports from the Juries, fully justifies. But we must plead in our excuse the interest and importance of the subject—an interest which we have felt growing upon us as we proceeded; and though we are aware that the subject has frequently been well and ably treated, yet we trust that in pointing out some novelties and improvements in the art, to which recent practice has given rise, we shall obtain forgiveness for exceeding in some small degree the limits assigned to us. In the remarks which we feel ourselves called upon to make, it has been our most anxious desire not to wound the feelings of any exhibitor, still less to do him an injury in his trade by any observation of ours, applying to his work. We have endeavoured to confine ourselves to general principles, not to point out defects; but to leave it to the exhibitor to judge for himself, whether our principles are correct, and whether he has acted in accordance with them; and if not, to amend his practice, and entitle himself to commendation on some future occasion.

There are, however, points at issue to which it is extremely important to call the most serious attention of the manufacturer. A difference of opinion prevails as to the actual composition of glass, and this must be regarded as a difference of principle. A practical difference prevails, particularly in cast plate-glass, as to the finishing and polishing. By finishing is meant the process of rubbing away the roughness or marks occasionally left on the surface after grinding, which will always be perceptible if they are not carefully removed before the glass is polished; and will consequently deteriorate its quality. Lastly, the question of price.

With respect to the first question—the composition of the metal—upon this must depend the merit of the glass, and consequently its value. The combination of as much brilliancy of refraction with as perfect purity of colour as can be obtained is the object desired.

By some manufacturers, purity of colour is sacrificed to brilliancy of refraction; by others, the reverse is the case. The real object, the *juste milieu*, can only be attained by a judicious selection and apportionment of the materials employed; and this can only be the result of careful experiments, and the study of the effect of various chemical combinations. The expulsion or retention of the alkalies, the metallic oxide used, the amount of heat employed, and the annealing process, are very important considerations in determining this question.

In some descriptions of glass the defect of colour is less apparent than in others. In mirrors a greenish hue, or a dull, heavy appearance in the glass, cannot fail of imparting to the object reflected a portion of its colour and tone; and in proportion to the extent of the defect, deteriorating the merit of the glass. The French and the Belgians have paid great attention to this circumstance; and judging from the specimens of the Cirey and St. Gobain glass in the Exhibition, and of the Belgian glass, which we have likewise seen in the hands of persons who had not the opportunity of exhibiting them, we should say, that if these glasses maintain their present appearance, and do not exude moisture, a very great advance has been made in the art, and a very perfect article of manufacture attained.

In England, the long-continued pressure of taxation exercised its influence over this species of glass, which, in consequence of its high price, was not in very great demand until the removal of the evil enabled the manufacturer to reduce his price, and improve the quality of his glass. Glass for glazing windows has been employed, in this country, to a far greater extent than silvered glass for mirrors; and the defect in colour is not so much perceived in the transparent glass, as in the latter. We are likewise told that, since the diminution in price, which took place on the reduction of the duties, the demand for both silvered and transparent plate-glass has increased to so great a degree, that hands cannot be found to supply the wants of the public; and that the consequence has been a less careful fabrication of the material, or rather a fabrication of an inferior article, at the lowest price possible. It has been stated, that the more perfect manufacture of the French and Belgian artists will not stand the test of time, and that deterioration will occur, both in colour and structure, by the decomposition of the alkalies used in the manufacture.

We reply, that we are informed the practice of the Cirey and St. Gobain manufacturers is, to keep a very large quantity of their glass in store, sometimes for many years together, and that they have never experienced deterioration, and consequently do not fear its occurrence through lapse of time; and that, though we may admit, it may be both right and politic to supply the public with a low-priced article of inferior quality, we do not believe those manufacturers are consulting their own interest, who fabricate an important article in an inferior manner, and who exhibit products, calculated to attract the wealthy and the fastidious by the qualities of magnitude and beauty, but which, on inspection, are found liable to be charged with the defect of colour, of striæ, of globules, of undulations, &c. We believe that success in trade, as well as the honour of excelling in manufacture, requires gradations in fabrication, suitable to the means and tastes of the different classes of purchasers; but that each gradation should be as good of its kind, as the nature of its process will admit of its being made.

With respect to the third question, that of price, it is of course a most important question; and it is a most difficult one to answer. The Commissioners had the question under their consideration for a considerable time, and at last wisely determined not to meddle with it. It does not depend upon arbitrary regulation, but upon circumstances which are necessarily fluctuating. Capital, taxation, supply and demand, fashion, all more or less affect prices, and prevent them from being the real indicators of the intrinsic value of an article exposed for sale.

Having ventured to make these general observations, it only remains for us to state the principle upon which the award of Medals has been made, and the grounds upon which the Jury has decided in favour of the suc-

cessful competitors. We trust that in what we have said, it will be believed that we have no other object in view than to act in accordance with our duty, and deliver our opinion faithfully, according to the best of our judgment; and in doing so, if we "just hint a fault," we do not "hesitate dislike." We are proud of our manufactures; we enter warmly into the interests of the persons engaged in their production. Perhaps we are over anxious for their success. But we see, and we see it with satisfaction, that the foreigners are making rapid advances; and are bringing their intelligence and their taste into competition with us. We see new and extensive fields, opening every day by the wisdom of Providence, for the application of our energies and our resources; and it becomes our duty, as well as our interest, not to be backward in the struggle. "Up and be doing, and God will prosper." His bounty has prospered us in a most abundant and astonishing degree; and, from the tiller of the soil, the manufacturer of her produce, to the fabricator of the most delicate work, it will be by our own fault if we cease to excel. On behalf of that art which is more particularly under our consideration, we claim the exercise of increased energy and science. It is a manufacture for which the primary constituents are easily and cheaply supplied; and it combines, in a remarkable degree, the purposes of utility, of comfort to all classes, and of decoration. It reflects the splendour of the palace, and the beauty of the toilet. It lends its aid to science, and conveys the power of vision into infinite space; and, within the last few years, has enabled the astronomer to detect, in the obscurity of their remoteness, planets on which the eye of man had never rested before; and likewise, by its aid, amid the ruins of a former creation, countless millions of animalcules may be observed through the microscope in the oolitic formations of our globe. It imparts comfort alike to the rich and the poor, by the admission of the bright rays of the sun into their abodes, and the exclusion of the inclemency of the weather. It assists the sight of declining years, and enables the aged man to seek comfort in his Bible, and impart its Divine truths to his family. It directs the seaman in his midnight course, warning him of danger, and cheering him by the prospect of security and home.

In drawing up the foregoing Report, information has been most liberally supplied, of the advantage of which the Reporter is fully sensible, and he begs leave to return his warmest thanks to John Wood, Esq., Chairman of the Inland Revenue Board; to M. Bouteyns, and to Charles Winston, Esq., for their valuable assistance and advice; to Sir David Brewster, and Mr. Ross, more particularly for that which relates to the question of the structure of glass for optical purposes; and to Messrs. Zuccani, Wood, Pellatt, and others, for the information which they have so readily given. The highly interesting articles in Lardner's Cabinet Cyclopædia, in the Encyclopædia Britannica, and Metropolitana, and in M. Labart's work on the collection of Debruge Dumenil, have supplied very valuable information, and will amply repay the trouble of referring to them; and the Reporter cannot conclude without taking leave of the English and Foreign Associates in the Jury, over which he has had the honour to preside; and affording his testimony to the zeal and intelligence which they have manifested in the discharge of the duties which they have been invited to undertake; and without expressing his satisfaction in witnessing the cordiality with which Foreigners and Englishmen have acted together; and though differing in habits and opinions, and urging those opinions with acuteness and with earnestness, have gracefully conceded, where they failed in persuading the majority; and he begs them to accept his sincere thanks for their able support, and their courtesy, kindness, and indulgence to himself in the discharge of their mutual duties.

#### AWARD OF THE MEDALS.

The Instructions of the Executive Committee are understood by the Jury to be to this effect:—

No question of nationality is to affect the judgment of the Jury.

No comparison of the respective merits of exhibitors is

to be made. In recommending for the Council Medal, and in awarding the Prize Medal at the disposal of the Juries, the merit of the article exhibited, simply, is to be regarded.

Where an exhibitor is a member of a Jury, he cannot compete for any Medal. But the Jury think themselves justified in adverting in their Report to the merits of the object which a Juror may have exhibited; and likewise in mentioning favourably those works, which are not of sufficient importance to lay claim to a Medal.

Excellence in manufacture, being, in other words, a mere difference in degree of merit between subjects included in the same Class, cannot be rewarded with a Council Medal without a deviation from the principles laid down by the Commission. Novelty of invention, or adaptation, or peculiarity in the mode of manufacture, if deemed of sufficient importance, may entitle to the reward of a Council Medal.

It is important that the exhibitors, as well as the Jury, should keep the principle involved in these Instructions clearly in view; because it cannot but appear at first sight to be an anomaly, to withhold from objects of importance or value a Council Medal, while this distinction is recommended for products, which, if not inferior in importance, beauty, or utility, are at least attended with infinitely less expense and risk in the manufacture. But the instructions of the Commissioners are so stringent on this point, as to relieve the Jury from all doubt upon the subject.

In Class XXIV, these observations apply particularly to plate-glass, and to crystal, in the fabrication of which there can be no material novelty, though beauty and merit of a high order may be obtained. But unless novelty, or extraordinary merit as works of art can be shown, these sections cannot claim the highest distinction.

In the case of Messrs. OSLEA, of Birmingham, the Jury thought they were justified in recommending them for a Council Medal, in consequence of the general merit of the works exhibited by them, and a novel application of the art in the crystal fountain, placed in the centre of the Nave, which is good as a specimen of manufacture, more particularly when the magnitude of the pieces of which it is composed, and difficulty of execution, are taken into account; and though possibly the architectural design may be capable of improvement, yet there is no doubt of its being a work of great beauty, and of its adding very materially to the brilliancy and general effect, in the conspicuous part of the Building in which it is placed. But the opinion of the Jury was overruled by the Council of Chairmen, and the Council Medal withheld.

The magnitude and brilliant effect of the Building itself, which have obtained for it the denomination of the Crystal Palace, render it the first and principal object of admiration.

The material which forms so important a feature of the structure, brings it in some measure within the scope of our Jury, and we avail ourselves of the opportunity to express our high sense of the merit of Mr. PAXTON, who suggested, and of Messrs. FOX, HENDERSON, and Co., who have carried into execution a work so well adapted for the object for which it was intended; so honourable to the ability, enterprise, and industry of British artisans, and of so much brilliancy in itself; and we heartily concur in the award which has been made in favour of these gentlemen.

A Council Medal has been awarded, on the recommendation of the Jury, to M. MAËS, of Clichy, near Paris, for the reasons assigned in their Report, viz., the application of a novel chemical combination in the manufacture of lenses for optical purposes, by means of which glass, remarkable for its purity, brilliancy and beauty, has been produced, and exhibited by him. He claims the merit of novelty in the use of barytes of magnesia, and of oxide of zinc, in combination with boracic acid, which facilitates their fusion and easy vitrification. This facility is of great importance, particularly in glass intended for optical purposes; as it tends to the more perfect commingling of the substances employed in the construction of the metal; and consequently to render it more homogeneous, and free from striae, bubbles, and other defects

peculiarly injurious to glass of this description. It is true that this glass has not stood the test of time; and that the borax, required for its production, is extremely expensive, and liable to other objections;\* but novelty is the principle insisted upon by the Commissioners, and the experiment, as far as it has been tried, has been eminently successful in the production of glass of remarkable brightness and purity; and the object in view being one of great importance, the Jury have viewed with satisfaction this first step made by M. Maës at considerable expense and risk to himself; and in the hope that it may lead to important results, they have thought themselves justified in recommending him to the Council for the award of a Council Medal.

M. Maës has likewise exhibited some very beautiful specimens of coloured, and other ornamental glass.

The name of CHANCE occurs so frequently in the preceding observations, and is so honourably connected with every branch of the manufacture, that we cannot but regret that, according to the regulations laid down by the Commissioners, their firm is precluded from entering into competition for the Medals by the fact of one of the partners having consented to act as a Member of our Jury. But though Mr. R. L. Chance is thus disqualified by his own act, he has entitled himself still more to the consideration of the Jury by the valuable assistance which his practical experience, and intimate knowledge of the details of the subjects committed to our investigation, have enabled him to afford.

When we witness the magnitude and variety of the operations undertaken by this firm, the merit of their works, the liberality, intelligence, and spirit of enterprise, which they have manifested at great cost and risk in experiments, tried for the purpose of introducing into this country branches of manufacture almost exclusively practised by continental enterprise—when we consider the advantage of inducing men, so eminent in their occupation as M. Bontemps and M. Tabouret, to settle in this country, and superintend our works—we feel that we should not act with justice by Messrs. Chance, or do our duty by the Commissioners and the public, if we did not call their attention, in a special manner, to the merits of the firm.

In addition to the improvement effected by Messrs. Chance, in crown or sheet glass, and the introduction of their patent plate in the market, they have also exhibited specimens of coloured window-glass, of painted windows, of glass shades made by the application of machinery and far exceeding the dimensions of any similar work of this description hitherto attempted, and glass for optical purposes, described in the section to which that substance is referred.

They also exhibit some extremely thin glass, 200 to 300 to the inch, for purposes connected with the use of the microscope, and for experiments relating to the polarization of light, the want of which had formerly been found to be a great disadvantage in researches of this nature. This thin glass was introduced by Messrs. Chance as far back as the year 1840; and the Jury were informed by Mr. Ross, that by its use microscopes were made of very far higher power, than could otherwise have been produced.

M. JULES PRISON, of Dampremy, near Charleroi, being a member of the Jury, is likewise disqualified from entering into competition for the Medals. He is sole proprietor of the manufactory, and carries on an extensive business; the larger part of his produce being made for exportation. He has sent to the Exhibition sheet window-glass of very good quality, well blown, well flattened, with a very good surface, and free from fire-specks and scratches. He has also contributed some good glass, obscured by mechanical process; likewise some fluted glass.

#### SECTION B.

In the classification of objects exhibited, which has been delivered by order of the Commissioners to the Jurors for their instruction in determining the merits of

\* The facility with which boracic acid fuses earthy particles is so great, that if not used with much caution, it acts upon the earthen pots, and conveys alumina into the metal, when in a state of fusion.

the articles contained in each Class, "painted and other kinds of window glass" are referred, in Section B, to the Jury appointed to consider and report upon Class XXIV., and they proceed, accordingly, to discharge the duty assigned to them by delivering their opinion in the subjoined Report.

But the Medals having been awarded by the Jury of Class XXX. to the exhibitors of the objects referred to in this section of Class XXIV., we shall confine our Report to the statement of what we consider to be the principles of this branch of the manufacture of glass, and the use which the exhibitors appear to us to have made of it.

#### GLASS PAINTINGS.

Of the glass paintings, displayed in the Exhibition, there are some whose subject is a picture, a pattern, an heraldic device, or an intermixture of these three; and some of the pictures, and of the pattern glass paintings appear to have been designed and executed in a particular style of their own. The various works thus present so many different points for consideration as to render it impossible to lay down any one general rule for deciding on their pretensions; but by stating, as concisely as we can, the principles by which we have been guided in making the following observations, an opportunity is afforded of ascertaining their correctness or incorrectness; and the exhibitors may be enabled to draw their own conclusions as to the opinion which we entertain of the merits of their works.

It is hardly necessary to observe that glass painting must be judged by a different standard from that which is applied to other kinds of painting. The material employed imposes upon the artist an obedience to certain conditions in the design and execution of the work. His object should be, not to produce the best possible picture, but the best brilliant and transparent picture. Among the excellencies which are equally essential to a good glass painting, and to an oil or fresco painting, may be mentioned, a design which is pleasing in itself, and which is composed with reference to the effect sought to be produced at the distance from which it is intended to be viewed, correct drawing (which includes the course or the shadows as well as mere outlines), and harmony or colour. But such a composition must be chosen, and such a mode of colouring must be adopted, as are calculated, among other things, to display to the best advantage the brilliancy and transparency of the material, and to accord best with the mechanical construction of glass painting, which, unless it is of very moderate dimensions, must necessarily consist of several pieces or glass, connected together with lead or other metal, and supported with iron bars.

As a general rule, the best, because the most effective, composition for a glass painting (not being a mere pattern), is a single figure, or a group consisting of foreground figures, with either a landscape, an architectural, or a plain coloured back-ground; the landscape, if any, being treated as a mere accessory to the group. And the mode of execution which appears to display to the best advantage the brilliancy and transparency of the material is, where the colouring is chiefly produced by means of glass coloured in the manufacture;\* where the shadows are transparent, but have hard and sharp edges; and, above all, where a large proportion of the lights are left clear and unencumbered with enamel paint.

Of the correctness of the view, so far as it relates to the sort of composition, and to the mode of colouring best suited for a glass window, we have the less doubt, since nearly all the exhibitors have acted consistently with it; but we also find that our opinion of hard-edged shadows and clear lights is opposed to the practice or nearly all the exhibitors, including those most distinguished by their works.

\* We are speaking of the art in its present state; if enamel painting were to be so far improved as to admit of glass being, by this means, as strongly and vividly coloured as it can be coloured in its manufacture, the objection to colouring glass with enamel colours would fall. But to such an improvement certain physical obstacles appear to be opposed.

To their authority we can only oppose that of the glass painters of the first half of the sixteenth century, when, owing to the similarity of the material, the conditions of glass painting very closely resembled the conditions of modern glass painting; and we would invite a comparison of such works as, for instance, the windows of the chapel of the Miraculous Sacrament, on the north side of the choir of St. Guld's Cathedral, Brussels, and the two transept windows of that cathedral, with the windows of Gouda Church, Holland, and of Amsterdam Cathedral, both which are of the last half of the sixteenth century, with any of the works now exhibited; and if it appears that the Brussels and Lichfield windows are more brilliant, more glass-like, and (allowance being made for modern improvements in drawing) as pictorially effective as any of the other works to which we have referred, then we are justified in considering that the limit to which the obscuration of the glass may be carried was reached at the end of the first half of the sixteenth century, and, consequently, in regarding the works of that period as standards of true glass painting by which other glass paintings of similar nature may be judged.

The question, however, must ever be matter of opinion, and must ultimately resolve itself into a question of taste, which can only be determined by actually making the comparison suggested, and inspecting the windows themselves.

In estimating, then, the merits of a glass painting, we have to consider, first, to what extent the conditions of the art have been observed; secondly, its artistic merit as a picture or painting.

According to these principles, a work in which the composition and drawing are indifferent, but which displays vivid and powerful colouring, or is brilliant in effect, is preferable, as a glass painting, to one which is dark and dull, but in which the drawing and composition are good. Of this, we have a striking example in the ante-chapel of New College, Oxford. Sir Joshua Reynolds' window, with all its excellencies of drawing and composition, is not to be compared in effect with the rude windows of Wykeham's time that surround it. Still, though a due regard to the conditions of the art is of such preponderating weight in the merits of a glass painting, other artistic qualities, as has been said before, are not to be overlooked; consequently, of two glass paintings in which the conditions of the art have been equally observed or equally violated, that is to be preferred which displays the highest merits in composition, drawing, and other qualities of a good picture.

But besides the two points of view just mentioned, in which a glass painting is to be considered, it is necessary, in order to estimate the quality of a work professing to be executed in imitation of any ancient style, to judge of it with reference to the standard which its author has himself chosen. To condemn it on the one hand, if it falls short of the model which it professes to follow, and fails in the effect which it professes to produce; and, on the other hand, perhaps to make some allowance for peculiarities which would be objected to as faults, if they were not excused by the necessity of adhering to some characteristic features of the adopted style.

On examining an original specimen of any ancient style of glass painting, we cannot fail to be struck with the general harmony of its features. Not only does a strict consistency exist between the character of the figures and of the ornamental details, but these agree with the nature of the design and mode of execution, which again seem to be adopted and formed with reference to the nature and quality of the material used. The changes effected in process of time in the composition and texture of the glass appear to have involved, in the opinion of the ancient artists, corresponding changes in the very conditions of glass painting.

In all the glass paintings of earlier date than the last quarter of the fourteenth century—until which period the material commonly in use was not over clear, substantial in appearance, or intense in colour—the artists seem to have relied for effect principally on the richness and depth of the colouring. In these works the means of representation may be said to have been reduced almost to the lowest degree. Even the picture glass paintings are little

else than exceedingly powerful and brilliant mosaics. The figures are hardly distinguishable from each other, nor from the back-ground of the composition, otherwise than by their outlines and local colouring. The style of the painting is simple, bold, and forcible, as if the artists apprehended that softness of finish and nice gradations of light and shade would be useless and ineffective, and deemed those qualities to be alike incompatible with the simplicity of the composition, the positive character of the colouring, and the general brilliancy of the work. The drawing is effected by thick black outlines, which always strengthen, and sometimes even supply the place of broader shadows, and these shadows, when compared with those of later times, are weak, and are in great measure lost in the depth of the local colouring; which circumstance, however, renders their hardness the less perceptible.

The same style of execution is extended to patterns as well as to pictures. The design is traced on the glass with firm and strong outlines; and it is hardly necessary to remark—for this is observable in every original work,—that the harmony in form and character between the figures and the ornamental details, proclaims them to be the production of the same hand, and the conception of the same mind.

In all subsequent glass paintings, until the revival of the more ancient styles, which took place about twenty-five years ago, we may observe that in proportion as the glass became more pellucid, more flimsy in substance and appearance, and less powerful and intense in colour, a less mosaic and an increased pictorial effect was aimed at. The weakness of the individual colours was in a great measure compensated by their employment in larger masses, by judicious contrasts, and by harmonious arrangement. Their depth was increased by means of broader and more powerful shadowing, and a certain degree of richness was imparted by the more liberal use of diaper patterns and other minute embellishments. The drawing became more delicate, nicely-graduated and highly-wrought shadows were to a great extent substituted for stiff black outlines, and in many instances considerable attention was paid to perspective, and to atmospheric effects. In short, it would seem that the artists considered that the more refined nature of the material demanded as well as favoured a more refined pictorial treatment, and sought to compensate for its comparative thinness and weakness by the introduction of beauties of another description. The new system, it is true, was not fully developed until the middle of the sixteenth century; but its commencement may be easily traced as far back as the end of the fourteenth, by which time the principal change in the nature of the material had taken place.

Many persons, and among them some whose opinions are entitled to consideration, differ from the opinion that the material used previous to 1380 has not hitherto been successfully imitated; but on a point of so much importance we are bound to retain our opinion until convinced of its fallacy. That there is a visible difference in the appearance of modern glass and of that belonging to these early periods is admitted; but it is attempted to be accounted for by the supposition that it is solely due to the effect of age and exposure to the weather, and that the ancient glass, when first put up, must have appeared as weak and flimsy as our own. But as it is evident on breaking a piece of ancient glass, that the effect of antiquity is confined to its surface, the above supposition is destroyed by the observation that modern glass whose surfaces have, by artificial means, been reduced as nearly as possible to the same condition as that of the old glass, fails, nevertheless, in its resemblance to the old.

One of the most favourable examples of the closeness to which imitation of the thirteenth century glass can be carried by splashing the glass with enamel brown and other expedients, is afforded by a window recently put up in Mans Cathedral (the third cleveatory window from the west on the south side of the choir). We are unable to say by whom it was painted. But although the design, owing to the breadth of its colouring, is favourable to modern glass, the deception is decidedly incomplete. Equally unsuccessful are the admirable restorations of

the earlier thirteenth century windows in some of the apsidal chapels of Bourges Cathedral, executed, we believe, by M. Lussou. The modern glass may here be easily distinguished from the old by its want of crispness and its thinness, although it has been obscured in imitation of the effect produced by age and long exposure to the atmosphere.

We are strongly impressed with the opinion that the difference in effect between such ancient and modern glass does not depend on the state of the surface, but on the composition of the material, and this opinion has been much strengthened by the result of some chemical experiments recently made, by which the very great difference in the composition of modern glass and that of glass of the thirteenth century is clearly demonstrated.

Assuming the truth of the foregoing observations, it is obvious how important a bearing they have on modern imitations of the ancient style of glass painting. Those of the periods earlier than the last quarter of the fourth century having to be worked out in a mode of execution adapted to, and formed with reference to, a material very different from that of the present day, and therefore labouring under a disadvantage which hardly any skill or ingenuity can overcome; whilst, on the other hand, the glass of the present day resembling that of the fourteenth, or still more closely that of the sixteenth century, there is proportionably less difficulty, as far as material is concerned, in the way of the successful execution of works in the style of these periods.

The defects which appear to us to prevail the most generally are:—First, the misapplication of the materials, so that works which would have possessed merits as enamel paintings on china or any other opaque body, are, as glass paintings, weak in colour and deficient in transparency. The ill effect of thus confounding the principles of painting on an opaque surface with principles of painting upon a transparent body, like glass, are strikingly exemplified by observing, in the works of this description in the Exhibition, the difficulties the artist has had to contend with in the management of his material, notwithstanding the dexterity of his handling. The vividness of effect produced is barely superior to that of an oil painting, and in one, transparency of shadow, and general harmony, the glass is very inferior to a painting in oil. The metallic framework which, in every well-contrived glass painting, is conducive to the good effect of the work, is here an eyesore, imparting to those outlines which it follows a harshness which does not accord with the elaborate softness which many of our modern artists have adopted in lieu of the severer style of their predecessors.

Secondly. Non-adherence to the style, which has been selected by an artist for imitation in any particular work. For instance, we have sometimes found associated together in the same glass-painting, borders in the style of the fourteenth century, canopies of the fifteenth, and figures of the sixteenth. In others, though the ornamentation is drawn and executed in the style of an early period, the figures are either wholly in the style of a later one, or else accord with the ornamentation only in the drawing or composition; the elaborate softness of their execution having been borrowed from a considerably later period. Others, in which the drawing, mode of execution, and composition of an early period are scrupulously observed, both in the figures and ornamental details, are executed in a material, which, owing to its greater pellucidity, is essentially different from that in use at the period chosen for imitation; so that sometimes the different portions of the design itself are incongruous; sometimes the design is of such a character as to be unsuitable to the nature of the material in which it is worked; and we may add that the various attempts which have been made to imitate the richness and depth of the ancient material, by coating the glass with enamel paint, have produced no other effect than that of depriving it of its brilliancy, and consequently the glass paintings, in which this expedient has been resorted to, of one of their chief and distinguishing merits.

These observations apply, in our opinion, very generally to the modern style of imitating ancient glass paintings. Improvement in the style of drawing, and many other beauties, are to be met with in the objects exhibited

in Hyde Park, but these beauties are too often neutralized by the defects to which we have ventured to allude. The works are not original compositions, nor are they correct copies of the various styles which they profess to imitate.

BERTINI, of Milan. "Dante and his Thoughts."—In point of size, harmony of design, and beauty of drawing, this window is certainly entitled to claim a first-rate place; nor is there any work in the Exhibition, which, taken as a whole, is so superior to it as a glass painting as to prevent its merit as a work of art preponderating. Its defect is certainly the want of general brilliancy. Except in the Queen's glory, in the letters of the inscription over Dante's head, in the shields below, and the wreath surrounding his name (all which are true specimens of glass painting), and in the border of the windows, there are no sharp clear lights; and although pot-metal or flashed glass is used in places, as in Dante's robe, in the steps of the seat, in the sky to Domenico and Francisco, and in the robe of the figure in No. 4, it has been reduced to the same opacity as that of the enamel colouring employed in other parts of the window. The subjects taken from the infernal regions, Nos. 1, 2, 3, 4, are scarcely fitted for a glass painting, which is not suited for dark effects. The whole work is executed with so much softness, and is so highly finished, that the metallic fastenings have a harsh effect and form black lines, which do not harmonize with the delicacy of the painting; and though in general they are concealed with wonderful skill, yet they do appear in places, and rivet the attention the more the window is looked at. It may seem presumptuous thus to criticise one of the best works of the day; but the admiration which we feel for it has led us to compare it more rigidly with the windows at Brussels, and to arrive at the conclusion that it would suffer by comparison in point of general effect, though it would doubtless be superior to them in artistic refinement and drawing. Compared, however, with the more modern works it appears to advantage: for the quantity of white light introduced in the upper part of the design, in the Madonna, and in the tracery above, the angels, the crockets, and above all, in the ornamental bands or fillets which serve at once to connect together and to frame the different subjects, imparts to the window, a silvery or glass-like effect, which none of the others possess, and which completely rescues the work from the imputation of being like a fresco painting. The execution of the crockets and of the foliated ornaments round the shield is quite perfect; but perhaps the greatest display of skill is the manner in which Dante's head is made to stand free from the chair's back. The representation of one of the ladies' silk dresses and of the lining of Dante's cloak is a wonderful achievement in painted glass, and perhaps could not be accomplished in a work in which clear lights were considered indispensable.

In conclusion, we have only further to observe, that the defects which we have ventured to notice are those which prevail very generally in the works of the present day; but the beauties exhibited by M. Bertini in this production greatly preponderate, and are his own.

CAPRONIER, J. B., Brussels.—The conditions of the art of glass painting appear to have been complied with, on the whole, in this work more fully than in any other of equal or superior size in the Exhibition; for not only is the drawing good, the composition simple and calculated for distinctness of effect at a distance, but the angular character of the draperies, and the fineness and decision of the entire execution, are admirably suited to the nature of painted glass. The style principally followed is that of the first half of the sixteenth century. The absence of clear light, and over-painting of the head of the principal figure, are to be regretted as deviations from what we consider to be a correct observance of the style adopted. Still it is impossible to refuse to this composition a first-rate place.

The above is an extract from a very able Report upon the art of glass painting, and the objects exhibited, which Mr. Charles Winston, of the Temple, has had the kindness to supply.

SWITZERLAND (No. 75, p. 1271), DAGUET,\* F., Optical Glass.

This exhibitor was awarded a Council Medal by the Jury of Class X., and his name appears in their list of awards.

DE MAULEY, REPORTER.

London, September 1851.

## CLASS XXV.

### REPORT ON CERAMIC MANUFACTURES.

[The Figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

#### Jury.

Duke of ARGYLL, *Chairman and Reporter*, Stafford House, St. James's, and Roseneath.  
 CHARLES BARING WALLI, M.P., F.R.S., *Deputy Chairman*, 44 Berkeley Square.  
 E. EBELMEN, France; *Director of the National Manufactures*, Sevres; *Member of Central Jury, &c.*  
 GABRIEL KAMENSKY, Russia; *Councillor of the Administration of Finances, and Commissioner in*  
 London.  
 W. MORTLOCK, 18 Regent Street, Waterloo Place; *China Manufacturer.*  
 F. ODERNHIMER, Zollverein; *Director of the Board of Trade and Commerce*, Wiesbaden.  
 AUGUSTO PINTO BASTO, Portugal.  
 JOHN A. WISE, Clayton Hall, Newcastle-under-Lyne, Staffordshire.

#### Associates.

F. H. BALDOCK, M.P., 5 Hyde Park Place. (*Juror in Class XXIV.*)  
 THOMAS HETHRINGTON HENRY, F.R.S., 18 Lincoln's Inn Fields; *Analytical Chemist.*

In framing our Report on Class XXV. we are desirous of explaining, in the first place, the view we take of the duty assigned to us, as determined by the rules of the Royal Commissioners, and by the nature of the Class itself.

In the first place, the appointment of Juries implies, of course, that they are to judge of the comparative merits of the articles submitted to their inspection. In the second place, the fact of Medals being intrusted to their award implies, farther, that it is their duty to specify those articles which, in respect of high degrees of merit, they deem most remarkable. And lastly, the injunction to accompany their judgment with a Report, implies an expectation that the Juries, besides explaining to a certain extent the grounds on which that judgment has been come to in respect of Medals, should also indicate their opinion generally, on different kinds or minor degrees of merit.

These duties, however, become somewhat complicated by a special instruction from the Royal Commissioners that the Juries are to avoid giving encouragement to the distinctions of a merely individual character, and by an explanation that the award of Medals of different orders should not imply corresponding differences of degree in merit in the "same class of subjects." We have been much impressed both with the importance of complying with this instruction of the Commissioners, and with the difficulty of reconciling it completely with the necessary exercise of our functions. We have felt that in case of the Council Medal being awarded to one or more exhibitors of ceramic manufacture, "individual distinctions" would be necessarily involved between those exhibitors, and others to whom only the Prize Medal may be given; and again, whether the Council Medal is given or not to any, the same distinctions may be felt between those exhibitors who do get the Prize Medal and those who receive none.

The withdrawal of the Council Medal from the direct award of the Juries, and the limitation of their duty to recommendations merely for that award, has divided the responsibility, but has not removed the difficulty arising out of these considerations; inasmuch as recommendations, whether acceded to or not, involve the same distinctions as an actual award.

It has therefore been a matter of anxious consideration among the Juries to come to something like a common understanding as to the grounds on which such recommendations should be made; and the Group to which we belong, accordingly laid down the following general definition of the kinds of merit which ought alone to be so

distinguished:— "Important inventions and discoveries, or originality combined with excellence of design; novel application of known discoveries; great utility combined with economy and beauty; excellence of workmanship and quality."

Some of these definitions are obviously not easily applied to the kind of merit usually claimed for articles of ceramic manufacture; whilst others would require to be taken in an adapted sense. "Novelty of invention," unless displayed in entirely new compositions of the elementary earths, or in entirely new modes of dealing with them, will, in such manufacture, be generally reducible to improved methods of execution. Or if a higher sense be attached to "invention," as applied to form and high artistic merit, it will then fall under the other definition laid down, viz., "beauty and originality of design."

Understanding "invention" in the former and stricter sense, there is only one article in our Class in respect to which any important claim could be well advanced: we refer to that particular paste or body which has been variously called Parian, Carrara, or Statuary Porcelain, and which must undoubtedly be viewed as marking an important advance in the ceramic manufacture of this country. The facility and comparative cheapness with which the highest works of sculpture can be reproduced in this material—its durability and its beauty, have combined to give an important stimulus to the trade, and if well employed may much contribute to improve the public taste. It has already led to the great multiplication of copies of both antique and modern groups and statues, as well as to new designs of a similar kind.

But whilst fully acknowledging the importance to the ceramic art of this material, we do not feel called upon to found upon it any recommendation for a Council Medal. In the first place, the amount of novelty in the material is not easily defined, it being a modification of that which has long been known, and applied to the same department of art, under the name of Biscuit. However important this modification may be, it is hardly entitled to rank as an entirely new invention, especially as the improved result is attainable by several varieties of composition. This seems sufficiently established, not only by the fact that different manufacturers produce substantially the same material without identity of process, but by the further fact, that one of those who prefer a claim to the origination of parian expressly states that in his hands it has already undergone one important change.

In addition to this consideration, the Jury find that they could not recommend an award of the Council Medal for the invention of parian without deciding on the

disputed claim of priority between very eminent firms, who severally advance that claim with equal confidence. We have not felt it to be our duty to come to any such decision; especially as it would appear from the statement of each party that, whichever may have actually been first in publicly producing articles in this material, both were contemporaneously working with success towards the same result. We may add that the introduction of parian took place several years ago.

There is one other claim to novelty of invention in our class which, perhaps, goes nearer to fulfil the necessary conditions: we allude to the process of M. BAPTEROSSES for the manufacture of buttons by pressure applied to a dry body in the state of powder; but here also we consider the merit to be to a great extent divided. The original idea of this process is due to Mr. R. Prosser; and, under a patent obtained by him, it was carried on for some time by Messrs. Minton. The improvements, however, effected upon the process by J. F. Bapterosses, have been so great and so important, that the invention has, in a great measure, become his own, and has enabled him to beat the English manufacturers entirely out of the market. The principle, however, is identical. Under these circumstances, we have been unable to recommend M. Bapterosses to an award of the Council Medal on the ground of novelty of invention; although his merit is undoubtedly so high that we deem him well entitled, not merely to the award of the Prize Medal, but to very Special and Honourable Mention, on account of the inventive talent displayed in his process.

As the Jury do not, therefore, think that any sufficient ground for the award of the Council Medal has been presented, as regards priority of invention, it has only remained to consider whether they could recommend that award on the ground of "beauty and originality of design."

Although we do not hold ourselves bound to any very close or literal interpretation of this definition, we should still be departing from the whole intention with which the Council Medal was withdrawn from the direct award of the Juries, if we were to recommend it for any article or set of articles on account simply of superior execution in the same class of subject; and that, in as far as possible, we ought to limit ourselves in such recommendations to merit capable of being clearly separated from others *in kind*, and not merely *in degree*. It is only by adhering to this distinction that we can comply with the important instruction to avoid giving encouragement to "individual competition;" and although it is a line which cannot always be laid down with perfect precision, it is still capable of being followed with substantial fairness. For example, if two manufacturers exhibit each vases, plates, &c., with flower or landscape painting, and if the articles of the one were of great superiority *in execution* to the other, this superiority, however great, ought not to be expressed by a recommendation to the Council Medal, because these two exhibitors are evidently competitors in the same kind of merit: whereas, if one manufacturer shows articles of the above description, whilst another shows articles of new and beautiful form, and of high artistic merit in the grouping and design of figures, such two exhibitors are evidently *not* competitors in the same kind of merit, and the latter might be recommended for the award of the Council Medal without any "individual distinctions in the same class of subject" being drawn between them. The same distinction may be traced even in kinds of merit, which are both in a certain sense imitative. The successful introducer, into this country, of important processes of manufacture formerly confined to other lands, possesses a merit very different in kind from imitations more or less successful of the paintings and ornaments of old Sèvres or old Dresden.

Having thus explained the principles on which we have thought it our duty to consider recommendations for the Council Medal, we have only shortly to point out the consequences which result on the value to be assigned to the Prize Medal. Being the only one which we have to award for the whole articles of our Class,—except the few which answer the conditions demanded

for the Council Medal,—it follows that very wide differences in degrees of merit must indiscriminately receive the same acknowledgment—so far as the Medal merely is concerned. This circumstance will be strongly felt by many of the exhibitors who receive the Medal, and will diminish the value set on our awards. We have only to explain that it has tended equally to diminish the satisfaction with which we have made them; but that no evil or injury can arise from the result, provided the cause of it is publicly known and understood. The task of marking distinctions of merit between individual competitors in the same class of article was not only not given to us, but was advisedly withheld; and we have, therefore, only to explain emphatically that we by no means regarded as on the same level, or even near the same level, all those exhibitors to whom, nevertheless, we have been obliged to give the same award. In our Report we have held ourselves at liberty to depart, to a certain extent, from the rule which applies to Medals, and to point out the broader individual distinctions observable in our Class.

One other circumstance has presented itself respecting our awards, which we feel it necessary to mention. Our Class contains the produce of royal, national, or imperial manufactories; and it has been argued that these ought not to be brought into competition with the produce of private enterprise. In a certain sense we admit this argument to be just. The Sèvres manufactory, for example, being supported by national funds, and carried on as a school of national design, without reference to profit or loss,—the latter, indeed, being the admitted result,—we certainly feel that its productions cannot be fairly considered as standing on the same footing with those of private manufacturers. The latter have a greater number of conditions to fulfil, and of difficulties to overcome. The element of price, being an element of the most important character, does not enter into the view of the one, whilst, for the most part, it strictly limits the efforts of the other. The *merit*, therefore, as regards commercial value of their respective works, cannot be easily compared, and is certainly not measured by a comparison simply of their beauty. We are relieved, however, from the difficulty which might arise out of these considerations by understanding that we are to judge of the articles in our Class as they appear before us, without reference to extraneous considerations respecting origin. We think it our duty, however, in the Report to point out the important distinction above referred to, and to explain distinctly that, in admitting, as we unanimously do, the very high character of the Sèvres Exhibition, and in recommending it to an award of the Council Medal, we do not hold that, in point of merit, it can be justly compared with any other series of articles in our Class, except those which are similarly circumstanced.

Before proceeding to notice particulars, we may observe that the ceramic art of the world is represented by a series of articles, which, though not calculated to illustrate its past history and progress, is at least sufficient to give a very adequate idea of its present condition. The imperial, royal, or national manufactories of Russia, Austria, Prussia, Saxony, Bavaria, Denmark, and France, have all sent specimens of their production. Private enterprise in the same art is honourably represented from France, from many of the States of the Zollverein, and from Austria. A few exhibitors appear from Portugal. One article is shown from America. The manufacture of Turkey is also exhibited in a limited number of articles. The East India Company show specimens of the graceful forms of Indian pottery; whilst the well-known productions of China are among the articles collected from that country. But, undoubtedly, the collection which most largely represents the commercial importance of the ceramic art as a branch of manufacture, and the advances it is capable of making under no other influence than that of private enterprise and public taste, is that which is exhibited on the British side, and mainly contributed by the Staffordshire potteries.

MINTON, II., and Co., Stoke-on-Trent, Staffordshire (1, pp. 709-711), stand foremost among the British ex-

hibitors for the number, variety, and beauty of their articles.

We have found it necessary to view this collection in two divisions: first, in respect of a group of articles which we have considered distinguishable in kind, and not merely in degree of merit, from all others in the class; and, secondly, another group which, though of high excellence and beauty, must be looked upon as claiming merit of the same kind with articles exhibited by several other manufacturers. The first of these is the great dessert service, which has attracted universal notice.

Some objection has been felt, and has been stated in our Jury, to the principle of mixing together the two different bodies of porcelain and parian, as detracting from unity of effect, and, to a certain extent, from merit of manufacture. But it may be questioned how far this objection could be sustained, except on a general rule which would be far from receiving universal assent. Another objection has been started to this service,—with reference to the position of the figures, as being too purely and evidently for ornament alone, and having too little connection with the structure and support of the vessels to which they are applied. To this it may be replied, that such use of figures, for ornament simply, is familiar in the best examples of ceramic art; although it is clearly one which requires to be very strictly governed by good taste, lest it should become redundant, and cease to be subordinate to the general design. It has been further remarked that the figures in some pieces of the service present too many salient points, which render the whole peculiarly liable to injury. In articles not purely decorative, but intended for use, this objection refers to a point well deserving the attention of designers and manufacturers.

The Jury were, however, unanimously of opinion that the dessert service of Messrs. MINTON, being one of original design, presents a very high degree of beauty and harmony of effect; and that the design and modelling of the figures in many of the pieces are full of grace and spirit, evincing a remarkable degree of artistic merit.

The Jury must specially mention, as belonging to the first group of articles, the garden-pots and vases exhibited by Messrs. Minton, modelled in imitation of the old Majolica-ware, and not only remarkable for the success with which the effect of that ware is attained, but for novelty and beauty of design. A large vase, intended for similar purposes, designed by Baron MARONNETTI, and executed by Messrs. Minton, is worthy of notice, both for beauty of style and great size.

Thirdly, the attention of the Jury was directed to the manufacture of hard porcelain for chemical purposes, lately established by Messrs. MINTON. It is well known that for such articles the laboratory has hitherto been dependent on the Dresden, Berlin, and other foreign manufactories: these crucibles and capsules have been subjected by Mr. Henry, at the instance of the Jury, to the severest chemical tests, along with specimens from Dresden, and have been found to stand these tests with perfect success; and besides being fully equal to the German ware in quality, they have the additional merit of being considerably cheaper. The Jury have considered the successful establishment of this manufacture in England as a matter of much importance and interest in a scientific point of view.

The second group of articles exhibited by Messrs. MINTON includes articles of very remarkable merit and beauty in almost every department of the ceramic art in which other English exhibitors compete, and would alone place Messrs. Minton among the very first of these. It is unnecessary in this Report to specify details minutely. It is sufficient to say that the articles exhibited by Messrs. Minton in imitation of old Sèvres, their flower-painting on a great variety of plates, on their small tea-services, on their earthenware basins, ewers, &c., and their smaller articles of a more purely decorative character, are all remarkable for great freshness of effect and excellent taste. Their parian figures are very good; and a chimney-piece of this material is a new and remarkable adaptation of it.

The Jury were unanimous in recommending Messrs. MINTON for a Council Medal, but founded it only on those articles first referred to, in respect of which originality and beauty of design, and not mere excellence of execution, were prominent merits.

COPELAND, W. T., Stoke-on-Trent, Staffordshire (2, pp. 711-714).—This exhibition is remarkable in several respects, especially for the great beauty of the parian groups and figures, several of which are eminently successful, and show complete mastery over this material in its best and most legitimate application. The Jury especially desire to mention the large porcelain slabs or panels decorated with flower-painting and other patterns, and now much used for fire-places, panels, tables, and a variety of other purposes connected with useful and ornamental furniture. The large flower-painting on some of these has a very handsome effect; and some Pompeian patterns are particularly pleasing.

Mr. COPELAND shows a large assortment of plates and other articles of ornamental porcelain. The flower-painting and gilding are, in many of them, very good; and especially in the centering of the plates, much taste is observable in the arrangement of the pattern. Some large vases of Etruscan shape and style of decoration are handsome. Mr. Copeland has also some articles, in which the effect of inlaid pearls and other jewels is rendered with considerable success. The value of this novel style may be a question of taste; but it undoubtedly exhibits much skill in the processes of manufacture. Other articles are of a colour which is claimed as new, and has a certain richness of effect; but as no extensive series of articles with this colour are exhibited, the Jury are unable to state how far it can be reproduced with the certainty and uniformity of tint requisite to establish it as an improvement in ceramic decoration.

The earthenware of Mr. Copeland is of excellent quality; and on some plates the Jury observed prints worthy of special notice on account of simplicity and effect.

A Prize Medal is awarded him for the general high merit shown in his extensive collection.

WEDGWOOD, T., and Sons, Etruria, Staffordshire (6, pp. 717-719).—The articles exhibited by this firm are of great as well as of long-acknowledged merit—which consists chiefly in a faithful revival of the forms originated by the enterprise of the elder Wedgwood, some of the most remarkable of which were suggested by the genius of Flaxman. The classic beauty of some of these designs in terra cotta, jasper, and fine stoneware, has never since been surpassed or equalled; and no better desire could be entertained for the popular taste of this country in respect to this class of article than that it should again be familiarized with these productions, which are of purely national origin, and are capable of being applied, and that cheaply, to almost every variety of domestic use. The white and printed earthenware of this firm, long celebrated, and particularly adapted for the export trade, maintains its old and well-merited reputation. The Jury have had great pleasure in giving a Prize Medal to this exhibitor.

ROSE, J., and Co., Coalbrook Dale, Shropshire (47, p. 727), have exhibited porcelain services and other articles, which have attracted the special attention of the Jury. A dessert service of a rose ground is in particular remarkable, not only as being the nearest approach we have seen to the famous colour which it is designed to imitate, but for the excellence of the flower-painting, gilding, and other decorations, and the hardness and transparency of glaze. The same observation applies to other porcelain articles exhibited by this firm. The Jury have awarded to Messrs. ROSE and Co. a Prize Medal.

Before proceeding to mention the remaining English exhibitors to whom the Jury have awarded the Prize Medal, it may be well to state generally that this reward has respect chiefly, if not entirely, to that branch of the ceramic art which has been so extensively developed in England, and which has constituted it an important branch of our national industry, viz., the manufacture of stone and earthenware for domestic use. Articles of

porcelain are also exhibited by some of the firms hereafter named; but the Jury have not been able to consider these as furnishing any ground for an award. In many cases, indeed, they are open to much criticism. Violent colours, and forms of loose indefinite shape, with much overladen decoration, are frequent. The Jury has also noticed in some cases a fault to which they deem it well to direct attention, viz., the application of elaborate gilding and flower-painting, very suitable for porcelain, and sometimes of taste and execution which would have been well adapted to that material, to the inferior substances of stone and earthenware. This they consider a misapplication of skill and labour, expended with no adequate result, or with effects which, to a severe taste, are positively displeasing.

RIDGWAY, J., and Co., Caudon Place, Staffordshire (5, p. 714), is one of the most important manufacturers of earthenware in the Staffordshire Potteries, and exhibits articles in this department of first-rate quality. He has, with much spirit, ingenuity, and success, adapted the material to a variety of sanitary purposes; and in his stall the Jury observed the application, or the proposed application, of it to the banister and hand-rail of staircases. The specimen shown has at first sight a fresh and pleasing effect; but it may be questioned how far the mechanical difficulty of preserving accuracy of outlines in such large pieces as are requisite for this purpose can be successfully overcome. Lawn and conservatory fountains are also shown. The excellent quality of Messrs. Ridgway's ware, fully accounting for its commercial importance of their manufacture, has well entitled them, in the estimation of the Jury, to an award of the Prize Medal.

MAYER, T. J. and J., Burslem, Staffordshire (9, p. 719), is another firm in this great branch of manufacture, and have exhibited a most interesting assortment of articles illustrative of the ordinary course of their trade, which is principally connected with the markets of the American Continent. Messrs. Mayer adapt their excellent material to every variety of useful purpose. One of these appears to be novel. They have made tea-urns of stoneware of a hard vitreous body, capable of withstanding the variations of temperature required in this application. They have also exhibited a variety of jugs in parian, to which material they have applied colour with success, and in the composition of which they claim to have introduced some important modifications, with the view of rendering it proof against the effect of sudden changes of temperature, from boiling water, &c. The Jury have awarded to Messrs. Mayer a Prize Medal.

DIMMOCK, T., Shelton, Staffordshire (12, p. 722).—This manufacturer has exhibited also earthenware of first-rate quality; and the Jury have much admired the neatness and good taste of his printed patterns, the agreeable effect of his "flowing blue," and in general the excellence of his ware. They have awarded a Prize Medal to this exhibitor.

ALCOCK, S., and Co., Burslem, Staffordshire (7, p. 719).—This is another very important stall, as exhibiting the productions of a most extensive manufacturer, as well in porcelain as in the cheaper wares. Fancy articles in parian or biscuit, of most delicate execution, are shown in this stall; and the Jury may mention as remarkable for fancy and freshness of effect a number of vases and jugs, of various forms and colours,—in particular some with white figures on a blue ground,—and some with green ornaments on the same ground. The Jury have awarded a Prize Medal.

MASON, C., and Sons, Hanley, Staffordshire (10, p. 720), have exhibited excellent earthenware, and some specimens of very remarkable size, especially two great vases, of one piece each. Their white enamel ware is of first-rate quality, and has an extensive hold on the market. The Jury have awarded a Prize Medal.

BOOTE, T. and R., Burslem, Staffordshire (11, p. 722).—The articles exhibited in this stall are well worthy of special notice, on account both of some new processes in the manufacture of earthenware, and for the remarkable grace and beauty of some of the productions. The inlaying of one clay upon another,—as white upon blue,

—is a process patented by Messrs. Boote, and has important results in rendering simple and easy certain effects and combinations of colour, which it was before impossible or difficult to produce. Some vases or jars exhibited by Messrs. Boote, of a pale brown clay colour, with vine leaves and tendrils in high relief, are deserving of much praise as both extremely beautiful in design and in effect, and manifesting great skill in the management of material. The Jury have awarded a Prize Medal.

BOURNE, J., Derby Pottery, Derby (35, p. 725).—This manufacturer has the merit of making stoneware bottles, which have the property of resisting the action of blacking in a manner which had been found extremely difficult of attainment. Their bottles are consequently employed to a large extent by Messrs. Day and Martin in the export trade to India and elsewhere. The Jury have awarded Mr. Bourne a Prize Medal.

GREEN, S., and Co., Lambeth (Class XXVII., 125, p. 775).—This firm exhibits some very remarkable specimens of stoneware, of great size, designed for the use of breweries, distilleries, &c., and which, on account of their hardness of glaze and other qualities, are of great value in many processes of chemical manufacture. The Jury have awarded a Prize Medal.

FRICH, J., London (38, p. 725), exhibits articles of earthenware for wash and steam-tubs, and other sanitary purposes, which have appeared to the Jury deserving the award of a Prize Medal.

The Jury, in addition to the Exhibitors before mentioned, to whom they have awarded Medals, desire to notice, as deserving very Honourable Mention, the following names:—

KENNEDY, W. S., Burslem, Staffordshire (4, p. 714), who exhibits a large assortment of door-handles, "plaques," and other similar applications of china and earthenware, which has become in his hands a separate and important branch of ceramic manufacture. In the objects in this stall, utility of application is combined with cheapness and agreeable appearance.

KEYS and MOUNTFORD, Newcastle-under-Lyne, Staffordshire (14, p. 722), exhibit a series of statuettes in parian, well executed, and of a pretty effect.

PRATT, F. and R., and Co., Fenton, Staffordshire (22, p. 724), exhibit some very remarkable specimens of a process which they seem to have greatly improved, viz., that of coloured printing under the glaze. The freshness and truth of the colouring, in some of these specimens, from pictures by Mulready, Wilkie, &c., are excellent. They also exhibit some earthenware of very good forms and style of ornament.

BELL, J., and Co., Glasgow (26, p. 724), being the only exhibitors in this Class from Scotland, are deserving of notice not only on this account, but on account also of the good quality and design of the ware they show.

CHAMBERLAIN and Co., of Worcester (44, p. 726), exhibit some perforated china of agreeable effect.

EDWARDS, J., and Sons, Dale Hall, Staffordshire (37, p. 725), exhibit a very large and fine model of the Warwick vase, in terra-cotta, and an earthenware tea-tray, &c.

GRATINGER, G., and Co., Worcester (46, p. 726), exhibit articles of semi-porcelain, the good quality of some of which, for chemical purposes, is well attested.

SOUTHORN, W., and Co., Brosely, Shropshire (29, p. 725), exhibit superior tobacco-pipes.

WOOD, G., Brentford (34, p. 725), exhibits some ornamental orange-tree garden-pots of remarkable size.

SHARPE BROTHERS and Co., Swadlineote, Burton-on-Trent (36, p. 725), exhibit specimens of ironstone earthenware and printed earthenware, which are worthy of notice.

LEE, J., Rotherham, Yorkshire (48, p. 728), exhibit the application of earthenware to letters for sign-boards, &c., which is a useful and pretty adaptation.

CHALLINOR, E. (Class XXVII., 104, p. 772).—Earthenware.

The attention of the Jury has been much attracted by two designs, one of a bust, the other of a vase, executed by JAMES MARSH (34, p. 732), a young pupil of the School of Design, Hanley, Staffordshire, which possess

remarkable merit, and deserve very Special and Honourable Mention.

In the French Department of this Class the Jury need hardly state, that they have unanimously assigned the first place to the SEVRES MANUFACTORY, and have recommended the Council Medal to be awarded to its productions. They must, however, again explain, that the light in which these ought to be regarded is wholly different from that in which the productions of commercial industry and enterprise are viewed. Their position is analogous to that of articles produced in a school of design; and in the French expositions they have never been allowed to come into competition with the ordinary products of private enterprise. There is no reference to cheapness of production. The manufactory is maintained by a large annual grant from the public funds, and the sale of its products, though the prices are very high, is so far from being successful, in a commercial point of view, that the result is a large annual loss. The articles are, for the most part, purely decorative. But considered as a school of design, which is not to follow but to guide the public taste, the importance of the Sevres manufactory can hardly be too highly estimated. Its influence has extended over the whole of Europe, and a large proportion of the most beautiful forms and styles of decoration, which are exhibited in the English and other departments of this Class, are derived either by direct imitation, or by slight modification, from the old productions of the Sevres school. The Jury are not prepared to say that the articles exhibited from Sevres are equal, either as regards variety or excellence, to those which were sent forth from the same establishment at a former period, and on which its traditional fame is principally founded: but without any attempt at the mere imitation of its own old forms, it still produces wares of admirable texture and workmanship, and equally remarkable for great refinement and purity of taste, both as regards form and decoration. It is to be observed, however, that in respect to texture, extreme lightness and fineness are incompatible with the strength requisite for domestic use, however beautiful for merely ornamental China. The Jury may specify in the Sevres department several large vases,—one or two of unusually large size,—which are all remarkable for beauty of form, and some of them for flower-painting, of admirable freshness and force. A large tazza, of fine blue, mounted in or-molu, is extremely handsome. As a work of pure ceramic art perhaps no single article is so remarkable as (16) a Celadon green vase, with white figures in relief, manipulated in a novel and peculiar manner by the pencil. The handles are also of porcelain, the whole deriving no adventitious attraction from or-molu or gilding. The Jury also observed a beautiful adaptation of a cinquecento form to a porcelain tazza, in white and gold; also a large plate or slab of porcelain for picture-painting, remarkable for great size, combined with truth of surface. Two perforated porcelain lanterns are worthy of Special Mention for very elaborate and accurate execution. Some articles are exhibited with painting of figures (in Pompeian style), executed on an unglazed body, which produces a novel and agreeable effect. There are also two vases and covers, and a large tazza finely painted with figures in a subdued shade of blue, which are very beautiful.

MM. JOUHANNEAU and DUBOIS, Limoges (1630, p. 1255), are exhibitors to whom the Jury have had great pleasure in awarding a Prize Medal. Articles in porcelain, of great size, good design, accurate execution, are among their productions. In particular, the Jury would refer to a stork vase, in which the birds are modelled with great boldness and effect, as also the green foliage. The white ground is of excellent colour and glaze, and the whole result most agreeable. Some large white perforated bottles and a white and Celadon green vase, with leaves of bleu-de-roi, &c., are objects well deserving special notice. Altogether much taste and spirit distinguish these exhibitors.

LE BARON A. DU TREMBLAY, Rubelles, near Melun (395, p. 1197), exhibits a series of articles equally remarkable for cheapness, for novel and agreeable effect, and for the ingenuity of the process by which that effect is attained. It is called "émail ombrant," and consists in

flooding coloured but transparent glazes over designs stamped in the body of the ware. A plane surface is thus produced, in which the cavities of the stamped design appear as shadows of various depths, the parts in highest relief coming nearest the surface of the glaze, and thus having the effect of the lights of the picture. Much taste is evinced in the selection of designs to which the process has been applied; and perhaps there is no other in the ceramic art by which, at so cheap a rate, designs of high artistic merit can be reproduced in the most harmonious tinting, for dessert or table services, and for other useful domestic purposes. The Jury have awarded to Baron Du Tremblay a Prize Medal.

GILLÉ, J. M., Porcelain Manufacturer, Paris (848, p. 1220), exhibits a variety of articles of fancy porcelain, which show taste and skill in the management of the material. Some statuettes, birds, &c., are executed with great delicacy and sharpness. The Jury have awarded a Prize Medal to this exhibitor.

M. DE BETTIGNIES, St. Amand les Eaux, near Valenciennes (1086, p. 1230).—This manufactory is remarkable for keeping up the old "pâte tendre," which was so celebrated a product of Sevres during a part of the eighteenth century; and this and the neighbouring manufactory of Tournay, in Belgium, are now the only two in Europe which maintain this particular kind of body. Much improvement has lately been effected by M. de Bettignies in the colouring and decoration of this ware; and specimens are exhibited, especially some vases of turquoise blue, which fully deserve, in the opinion of the Jury, the award of a Prize Medal.

M. MANNARD, Paris (1342, p. 1240), is an exhibitor whose *potterie grise* is excellent in its forms. There is an enamelled vase which is deserving of particular notice, and the Jury have awarded a Prize Medal.

BAPTÉROSES, J. F., Rue de la Muette, Paris (409, p. 1197), exhibits buttons made by a process equally effective and ingenious, described in the earlier part of this Report, by which an importance has been given to this branch of ceramic manufacture, which could not have otherwise attached to it. The Jury have had no hesitation in awarding a Prize Medal to M. Baptérosses, and Special Commendation.

The Jury have also awarded Prize Medals to the following Exhibitors:—

BASTO, PINTO, and Co. (Portugal, 1047 and 1108, p. 1317).

\*Copenhagen, THE ROYAL PORCELAIN MANUFACTORY at (33, p. 1357).

MADRAS POTTERY, THE (p. 921).

St. Petersburg, THE IMPERIAL CHINA MANUFACTORY at (318, p. 1376).

STRAHL, OTTO (Prussia, 206, p. 1059).

VILLEROY and BOCH (Prussia, 361, p. 1071).

ZIEGLER-PELLIN, (Switzerland 260, p. 1283), terra-cotta, deserves Honourable Mention.

Besides these Exhibitors, the following names in the French Department have been thought deserving of Special Mention;—H. I. NAST (659, p. 1209); ALLUAUD, sen. (1051, p. 1229); E. HONORÉ (877, p. 1221); C. AVISSEAU (1543, p. 1250); J. PETIT (1629, p. 1255); and GORSAS and PERIER (1253, p. 1237).

Austria.—THE IMPERIAL PORCELAIN MANUFACTORY OF VIENNA (615, p. 1038), has exhibited a series of articles for table-services, of different kinds, flower-baskets, a table painted with shells, corals, &c., &c., which have certain merits, and the Jury have agreed to award a Prize Medal.

FISCHER, Moritz, Hungary (618, p. 1038), exhibits porcelain articles of table-ware, embossed with white and gold, and with other patterns. The texture and colour of the white are good, and the Jury have awarded a Prize Medal.

The Jury also considered, in the Austrian Department, the MESSRS. HAIDINGER BROTHERS, Ellbogen, Bohemia (620, p. 1039) as deserving Honourable Mention; as also C. FISCHER, Bohemia (617, p. 1038).

In the Department of the Zollverein, the ROYAL PORCELAIN MANUFACTORY AT BERLIN (Prussia, 213, p. 1060), exhibits a variety of articles, of which the chief merit

consists in the landscape-painting, which is extremely well executed, and is employed in the decoration of vases, plates, &c. The same good execution is carried out in picture-paintings, chiefly copies of pictures of the Flemish school, on similar articles of porcelain. Much of the Berlin china is so covered with gold and painting that the body of the ware is almost entirely concealed. There are also exhibited from Berlin some statuettes in porcelain, and caudelabra of the same material, with leaves and figures on a pale greenish-grey ground, which are of good execution and design. The Jury have awarded a Prize Medal.

THE ROYAL SAXON CHINA MANUFACTORY, Meissen (Saxony, 10, p. 1105), exhibits the hard porcelain for chemical purposes, for which it has been long celebrated; also a considerable variety of ornamental china, as well as of dinner and coffee services, &c., &c. Some of these with enamelled paintings are well executed. A camellia plant in full flower, entirely executed in porcelain, is a very remarkable example of a kind of work which has long

maintained its ground in this manufactory, aided by the natural ductility of the clays which are employed. The flowers of this plant are executed in white of the greatest purity; and the leaves are all finely glazed. The Jury have awarded a Prize Medal.

THE ROYAL BAVARIAN PORCELAIN MANUFACTORY (Bavaria, 64, p. 1101), Nymphenburg, near Munich, exhibits articles in biscuit, and a variety in hard decorated porcelain, which manifest decided advance in taste both as to form and decoration. The picture-painting on some of these is extremely well executed. On the whole the Jury observe in this exhibition much spirit and originality, and have awarded it a Prize Medal.

Honourable Mention is accorded to the following:—

ARNOLDI, C. E. and F. (Prussia, 778, p. 1093).

Constantinople, PORCELAIN FACTORY at (p. 1397).

MATTSCHASS, J. G. H. (Widow), and Son (Prussia, 217, p. 1060).

TIELSCH, CARL, and Co. (Prussia, 212, p. 1060).

ARGYLE, REPORTER.

October 1851.

## CLASS XXVI.

## REPORT ON DECORATIVE FURNITURE AND UPHOLSTERY, INCLUDING PAPER-HANGINGS, PAPIER MACHÉ, AND JAPANNED GOODS.

[The Figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

*Jury.*

Professor ROESNER, *Chairman and Reporter*, Austria; President of the Imperial Academy of Fine Arts.  
 Lord ASHBURTON, *Deputy Chairman*, 82 Piccadilly.  
 JOHN LEWIS AUBERT, 20 Lower Road, Islington; Paper-stainer.  
 CHARLES DE BEYNE, Russia; Architect.  
 FRANÇOIS COFFENS, Belgium; Architect.  
 J. G. CRACE, *Joint Reporter*, 14 Wigmore Street, Cavendish Square; House Decorator.  
 CHARLES CROCCO, Sardinia; Manufacturer.  
 JOHN JACKSON, 49 Rathbone Place; Manufacturer of Composition and Papier Maché Ornaments.  
 W. MEYER, North Germany.  
 N. RONDOT, France; late of Embassy to China, and Member of Central Jury.  
 EDWARD SELL, 27 Albemarle Street; Upholsterer and Cabinet-maker.  
 JOHN WEBB, 8 Old Bond Street; Upholsterer and Cabinet-maker.

*Associates.*

Lieut.-Colonel DEMANET, 99 Warwick Street, Pimlico.  
 L. GRUNER, 12 Fitzroy Square; Architect. (Juror in Class XXIII.)  
 Chev. JUNCISA, Commissioner to the Exhibition for H.M. the King of Sardinia.  
 M. WOŁOWSKI, France; Professor to Museum of Arts and Sciences, Member of the Central Jury, and of the Legislative Assembly of France. (Juror in Class XXIX.)

THE objects comprised in this Class are of a kind intimately associated with the comfort and adornment of our dwellings; of great importance from the vast amount of skilled labour employed in their production; and of high interest, as displaying the state of industrial art in various countries.

A popular taste must be greatly influenced by those things which are ever before the eye as household companions, and in the manufacture of these it is therefore most essential to attend to the principles of tasteful design, for by those principles an article obtains its power of attraction.

*Furniture.*

It is important, both for the strength and good effect of furniture, that the principles of sound construction be well carried out, that the construction be evident, and that if carving or other ornament be introduced, it should be by decorating that construction itself, not by overlaying it and disguising it.

It is not necessary that an object be covered with ornament, or be extravagant in form, to obtain the element of beauty; articles of furniture are too often crowded with unnecessary embellishment, which, besides adding to their cost, interferes with their use, purpose, and convenience; the perfection of art manufacture consists in combining, with the greatest possible effect, the useful with the pleasing, and the execution of this can generally be most successfully carried out by adopting the simplest process.

The Jury, though fully sensible of the great beauty of many of the ornamental works in furniture collected at the Exhibition, yet regret that there have not been more specimens of ordinary furniture for general use; works whose merits consist in correct proportion, simple but well considered design, beauty of material, and perfect workmanship. Few have the means of purchasing such beautiful works as the sideboard of M. Fourdinois, or the cabinets of M. Ringuet-Leprince, which come almost under the head of fine art rather than of manufacture; and it is much to be desired that attention be directed towards improving the taste of those more ordinary objects that come into daily use by the many.

Cabinet furniture first became an article of general luxury about the beginning of the 16th century. At this period inlaid, as well as richly-carved furniture, was manufactured in Italy, and exported to various parts of Europe. Among the works now exhibited by Italy, some are distinguished by great excellence, particularly in the carved examples.

*From Tuscany.*—M. A. BARDETTI, of Florence, Sienna, (91, p. 1298), exhibits, with other things, a casket of great merit, most elaborately carved, introducing bas-reliefs of figures, ornaments, chimeras, &c.

A large cheval screen frame, in walnut wood, by LUIGI MARCHETTI, of Sienna (96, p. 1298), is very beautifully wrought with delicate ornament of good taste. An oval medallion frame, by PIETRO GIUSTI (123, p. 1300), is also a fine specimen of carving.

*From Sardinia.*—M. B. CAPELLO, of Turin (64, p. 1304), exhibits a very elegant inlaid table, a curule chair, and a pedestal—all ornamented in very pure taste in the Etruscan style, and of good execution.

In France ornamental cabinet-work had acquired considerable reputation in the time of Louis XIV. Its manufacturers have since then continued to produce works of great beauty, and have brought the art of marqueterie inlay to a high state of perfection: this work consists in inlaying woods of a great variety of tints in the form of flowers, ornaments, &c., and was greatly advanced in the last century by Reissner, who produced very beautiful specimens.

In buhl-work, also, wherein metals are inlaid upon grounds of tortoiseshell or ebony, or *vice versa*, the French have greatly excelled. This kind of ornamental inlay takes its name from M. de Boulle, a celebrated French cabinet-maker in the time of Louis XIV.

In Germany there has long been established cabinet-work of a high class, more especially for those exquisite ebony cabinets, inlaid with precious stones, and various woods and metals, surmounted with carved figures, and elaborately fitted with innumerable drawers, and with perspective recesses—presents fit for kings and princes: of these an excellent example is presented in the ebony cabinet of M. GÄBGER, of Vienna (631, p. 1039)—a most beautiful work, exquisitely finished.

Cabinet-work of a more useful description has been carried to a high state of perfection in Great Britain, whose manufacturers have studied to produce objects in which the prominent excellence is substantial quality and finished workmanship.

It was in England that mahogany, now so generally used, was first employed for cabinet furniture, about 1720. Dr. Gibbons, an eminent physician, having had some planks of this wood given to him by his brother, a West India captain, who had brought them in his vessel as ballast, wished to use them for a house he was building in King Street, Covent Garden, but the carpenters complained that the wood was too hard; it was therefore laid aside as useless. Soon after, Mrs. Gibbons wanted a candle-box, and the Doctor called in his cabinet-maker, Mr. Wollaston, to make him one of this wood, then lying in the garden. He also declared that it was too hard: the Doctor said he must get stronger tools; the candle-box was completed and approved, inasmuch that the Doctor then insisted on having a bureau made of the same wood, which was accordingly done; and the fine colour, polish, &c., were so pleasing, that he invited his friends to come and see it. Among them was the Duchess of Buckingham. Her Grace begged some of the same wood from Dr. Gibbons, and employed Wollaston to make a bureau for her also; on which the fame of mahogany and Mr. Wollaston was much raised. The wood became the fashion, was much admired, and from that time has continued to be used for furniture more than any other.

It will not be possible to give a description of the various details of the manufacture of cabinet-work, but an account of some of the more ornamental processes and results connected with it may be desirable.

Of these the marqueterie inlay is one of the most beautiful and interesting. In this work the design, having been first drawn on paper and properly coloured, is pricked with a fine needle, so that the outline of the ornament or other objects can be pounced on the various coloured woods proposed to be employed; these outlines being carefully marked in, are cut with a fine watch-spring saw, worked in a lathe: in most cases the wood forming the ground is cut with that forming the ornament, so that a piece cut out of white wood corresponds exactly in shape and size with the opening left in black wood, in which it therefore fits and forms the required pattern.

Tarsia-work, or the art of inlaying woods, had been practised from a very early date in Italy, and extensively employed in the decoration of wall panelling; and remains of this kind of work, revived by Fra Giovanni di Verona, in the 15th century, still exist in some of the Italian churches.

The earlier specimens of this work were executed in woods of different shades, but natural hues; afterwards, when flowers, birds, and coloured ornaments were introduced, various stained woods were employed: these, in most cases, have the disadvantage of fading, but in the admirable specimens of marqueterie inlay exhibited by M. CREMER, of Paris, (1573, p. 1252), the woods are stained by the process of M. Koucherie, which is stated to give them a permanent dye to a considerable depth. Notwithstanding, however, the beautiful effect of this work, it is desirable to adopt, as far as possible, the employment of woods of natural hues, as being more harmonious and more consistent with the nature of the work.

In those ornaments which are shaded, the effect is given by immersing the pieces in hot sand. The various parts, being cut out of the required tints in the proper form, are then placed according to the design, and fixed on paper; afterwards they are applied, like veneer, to the piece of furniture; being mounted, they are cleaned off and slightly polished, and the finer lines are then engraved.

The manufacture of buhl inlay is by exactly the same process, only that metals, tortoiseshell, and ebony are here the materials employed; the nature of the design is somewhat different, depending more upon simple outline forms. There are many beautiful specimens of this kind of work in the Exhibition, more particularly the cabinets of M. FORSTNER, of Wurtzburg, Bavaria (69, p. 1101),

where the figures and ornaments are designed and finished with infinite talent and skill.

There is another kind of inlay applied to furniture, which may be called mosaic inlay. The beautiful boxes made in India give some good specimens of this work in ivory and metal, equalled, however, by the inlaid furniture and boxes of M. MARCELIN, of Paris (606, p. 1207): the extraordinary table of Señor PEREZ, of Spain (271A, p. 1346), gives a fine example of this style of work, executed entirely in minute portions of wood; the same principle is carried out in a table by Nye, of Tonbridge Wells (54, p. 733).

Where the patterns assume geometric forms, this kind of work is executed by laying together slips of wood or metal, &c., in the particular forms required; these united slips are then cut transversely, and affixed to the grounds, as in marqueterie.

Immediately connected with inlaid cabinet-work is the manufacture of parquetterie, for floors; in this work the same principle is carried out as in marqueterie, only on a bolder scale; woods of different colours are cut to pattern, and inlaid one in the other, or so arranged as to produce very beautiful effects for floors. The specimens exhibited of MM. COUVERT and LUCAS (404, p. 1163), and M. DE KEYS, of Belgium (406, p. 1063), of MM. LEHTLER and SON, of Vienna (633, pp. 1039-40), and of Mr. MILLER, of Russia (299, p. 1376), show the perfection to which this art has been brought.

A very beautiful novelty at this Exhibition was the introduction of porcelain inlaid in furniture like marqueterie, by Messrs. RIVART and ANDRIEU (1439, p. 1245); in these examples, not only were panels of porcelain inserted, but the painted flowers were cut to form, and inlaid like the ornamental woods. In the cabinet of Mr. DOWNING, of London (404, p. 760), porcelain of a very high class of art is mounted in the panels and pilasters; and M. GAZINS, of St. Petersburg (297, p. 1376), contributes a cabinet in tulip-wood, mounted in or-molu, containing beautiful panels in porcelain. M. A. E. RINGET-LEPRINCE (1437, p. 1245) has introduced carvings of ivory, mounted with or-molu, on one of his cabinets, with excellent effect; and in his most beautiful ebony cabinet for medals, relieved with exquisite carvings, fine stones are inlaid so as to form part of its decoration. Many of the pieces of furniture owe much of their attraction to the metal ornaments with which they are mounted; but the ebony cabinet of M. BARREHENNE (1709, p. 1258) combines, in the very element of its construction, bronze ornaments and figures of a high class of art, so arranged as to form one united whole.

Of carved furniture there are many magnificent examples in the Exhibition. In the struggle to produce objects that might be specimens of the talents of the parties employed upon them, utility and purpose have in some degree been forgotten, and works brought forward that are objects of art rather than manufacture; still it is one of the advantages of this result that it tends to improve the art workman; it gives opportunity for the display of his skill; it causes a school of art to grow up and extend itself; and if it err by excess, it at any rate creates the ability to do right. Of the carved furniture, the grand buffet of M. FOUQUENOIS, of Paris (1231, p. 1236), is of the highest merit; whether for its composition, the carving of the more artistic portions, or its general execution, it is a noble work. The specimens by M. LÉNARD, of Paris (1326, p. 1239), though not large, are of great excellence, showing to what perfection and beauty the art of sculpture in wood can be brought. A large frame in pear-tree wood, very beautifully carved by M. LÉVESNE (573, p. 1205), affords another fine specimen of this branch of art.

The grand collection of furniture by MM. LEHTLER and SON, of Vienna (633, pp. 1039, 1040), exhibited in four rooms, displays considerable fancy and excellent workmanship, though the ornament is far too redundant for ordinary purposes.

The grand bookcase of Messrs. HOLLAND, of London (161, p. 745), is another example of carved furniture of a high class, and the sideboard and bookcase of Messrs.

JACKSON and GRAHAM (261, p. 755), the buffet of Messrs. COOKE, of Warwick (110, p. 827), the bed and toilet furniture of Messrs. TROLOPE (162, p. 745), the carved glass frame and other furniture of Messrs. SNELL (170, p. 746), the beautiful cradle and other objects by Mr. ROGERS (353, Class XXX., p. 842), a writing-table in walnut wood, with other specimens, by Messrs. GILLOWS (186, p. 748), and many works by other manufacturers of Great Britain, show that industrial art is well represented in this country.

There is another branch of cabinet-work which merits particular notice, that in which mechanical action is introduced; the specimens exhibited by MM. DAUMET and DAUMARET, of Lyons (1579, p. 1252), are most ingenious and curious; in their secret-pire, which is full of contrivances, one key unlocks all the drawers. These run in the most easy and perfect manner, if touched in the slightest degree; and the closing of one particular drawer shuts and fastens all the others. M. KRIEGER, of Paris (1283), also exhibits some furniture of excellent mechanical action, such as card-tables, toilets, &c.; and M. VON HAGEN, of Erfurt (770, p. 1093), has a cabinet of fine workmanship, in which the secret mechanism is skillfully carried out.

In the Austrian Collection are some curious chairs and furniture by M. THONET, of Vienna (641, p. 1040), in which the wood, inlaid with metal lines, is bent to the required forms without the usual framing.

Many excellent billiard-tables are exhibited: in one, by M. BOUHARDET, of Paris, (1106, p. 1230), the carving is of very beautiful design; another, by M. KNILL, of Vienna (632, p. 1039), is handsomely mounted in buhl inlay, and the inlaid cues of this manufacturer are very beautiful specimens. The billiard-tables of Messrs. THURSTON (17, p. 731), and of Messrs. BURROUGHS and WATTS, of London (4, p. 730), are of simpler construction, but solid, and of excellent workmanship.

#### *Decorations.*

The specimens exhibited under this head are decorations for walls and ceilings, imitations of woods and marbles, and painted blinds.

Several of the ceilings under the galleries of the Exhibition Building have been decorated with more or less taste, principally in the arabesque style. One, painted by Signor MONTANARI, of Milan (738, p. 1044), in one of the Austrian apartments, deserves particular notice: it is a coved ceiling, executed with great breadth of effect. The imitation of gold is excellent, and the general treatment is full of spirit and force.

In wall-decoration Mr. MORANT (164, pp. 745, 746) exhibits a handsome panel, mounted with gilt ornaments and mouldings; the latter upon a ground of looking-glass. In the centre of the panel is painted a figure surrounded by foliage arabesque.

Mr. MOXON'S panelling (252, p. 754), over a chimney-piece, by Mr. THOMAS (252, p. 754), in the English Furniture Court, is a tasteful specimen of decoration; and the imitations of woods and marbles by this gentleman are executed in a very superior manner, united with an ornamental character of a high class.

Messrs. HOLLAND, of Warwick (407, p. 760), exhibit table-tops in imitation of marbles, ornamentally arranged in the old Italian style, with good effect.

Mr. KERSHAW'S imitations of woods, Class XXVII. (1, p. 764) are also very excellent; and those by Messrs. NICOLL and ALLEN, Class XXVII. (69, p. 768) of wood and marble, have likewise considerable merit. Some of these imitations of woods are painted on glass, the polished surface of which gives great finish to the work.

Among the painted blinds, of which there are many exhibited, those by M. BACH-PERES, of Paris (1061, p. 1229), were considered good specimens.

The wax-cloth hangings, by M. VIVET, of Paris (734, p. 1215), are painted ornamentally in the style of Francis I., and are stated to be so prepared as to resist the effect of moisture.

Paper-hangings form a manufacture of considerable importance, carried on in most of the principal cities of

Europe, employing many artists and designers, and thousands of operatives, consuming also vast quantities of paper, colours, wool, and metal. They are important also, because they may be made the means of extensively diffusing taste for art; and from the low price of the cheaper kinds, enabling the humblest mechanic to give to his home an air of elegance and comfort.

It is difficult to determine the period when paper-hangings were invented. They are supposed to have been first made in China, and the introduction of these hangings into Europe probably suggested the manufacture here.

They may be divided into three kinds—the flock, the metal, and the coloured; and each of these seems to have been invented at a different time as an imitation of a distinct material. The flock, to imitate the figured tapestries and stuffs; the metal in imitation of the gilt leather hangings; and the coloured as a substitute for painted decoration.

It is generally allowed that flock-hangings were first manufactured in England, and invented by Jerome Lanyer, who obtained a patent in the reign of King Charles I., dated 1st May, 1634, and carried on his art in London.

In this patent it is stated, “that by his endeavours he hath found out an art and mystery of affixing wool, silk, and other materials of divers colours upon cloth, silk, cotton, leather, and other substances, with oil, size, and other cements, to make them useful for hangings and other occasions, which he calleth Loudriniana; and that the said art is of his own invention.”

M. Savary, in his Dictionary of Commerce, 1720, says that *fontaine-de-laine* or flock-hangings were first made at Rouen, but in a coarse manner, being only used for grounds, on which, with flocks of different kinds, were formed designs of brocades. They essayed to imitate tapestry-hangings, but not satisfactorily; and at last a manufactory was established at Paris, in the Faubourg St. Antoine, and there flowers and grotesques were introduced with success.

The manufacture is thus described by him:—“The artist, having prepared his design, drew on the cloth with a fat oil or varnish the subject intended to be represented; and then the flocker, from a tray containing the different tints of flocks, arranged in divisions, took the colours he required, and sprinkled them in a peculiar manner with his finger and thumb, so that the various shades and colours were properly blended, and an imitation of the wove tapestry produced.”

These descriptions, though detailing the manufacture of flock-hangings, yet do not allude to the use of paper as a ground, nor to blocks for printing. A French author, writing in 1723, says that paper-hangings, called tapestry in paper, were, till lately, only employed by the country people for their cottages, or by small tradesmen in their shops and rooms; but towards the end of the seventeenth century, the manufacture was raised to such a point of perfection and beauty, that, besides the quantities that were exported abroad, and to the principal cities of the kingdom, there was scarcely a house in Paris not decorated with it. The manufacture at that time is thus described:—

The design, having been drawn in outline on paper, pasted together, of the size required, was then divided into parts of a suitable form, and given to the carver or wood-engraver, to cut the design on blocks of pear-tree, much in the same manner as at present. The outline thus cut was printed in ink, with a press, on separate sheets of paper: when dry, these were painted by hand in distemper colours, and afterwards joined together, so as to form the required design. Grotesques and panels, in which were intermingled flowers, fruits, animals, and small figures, were then executed by the above process. M. Reveillon, of Paris, is considered to have introduced many improvements in this manufacture, and was celebrated for the beauty of his productions in the latter end of the last century. The pillage of the workshops of this manufacturer in the Faubourg St. Antoine was one of the first incidents of the Revolution in 1789.

In England this manufacture continued from the time of Lanyer, and obtained a high reputation. In 1712, a

duty of 12*d.* per square yard was imposed; and a Mr. Jackson, who established a factory at Hatterssea, for paper-hangings of classic design in chiaro-oscuro, writes, in a work published in 1754, in praise of his own productions, and condemns the fanciful paper-hangings at that time so much used, comparing them with the Chinese.

In the year 1786, there was established at Chelsea a manufactory for paper-hangings of a very superior description, by George and Frederick Elhardt. Works excelling even those of the present day were produced at this place; some of the blocks used are at present in possession of the writer of this Report: they have great merit in the designs, and are some of them 8 feet in length. These manufacturers carried the art to its highest point in England: they printed not only on paper, but also on silk and linen, and employed a number of artists in addition to workmen and children. M. She-ingham, of London, also excelled at that time in decorative paper-hangings.

During the present century the French have not only restored this branch of manufacture to a high state of perfection, but have also introduced many important improvements, such as the embossed flocks and the shading of flocks, the perfect imitation of chintz, improvements in the satin-grounds, and the introduction of work printed from engraved cylinders.

In England, the trade was protected by a duty of 12*d.* per square yard up to the year 1846, when the late Sir Robert Peel reduced it to 2*d.* This high duty acted almost as an exclusion to foreign makers, and there was therefore no competition with them, nor any inducement to improve. Since that time, however, the English manufacturers have made great progress in their art, both in style and workmanship, the trade has greatly increased, and the improved productions are sold at a greatly reduced price. They have, besides, applied themselves to the improved application of machinery, by which very beautiful papers are made at an extremely cheap rate.

The process of manufacturing ordinary paper-hangings, as now carried on, may be thus briefly described:—

The pattern being first carefully drawn, is then pricked, and the outlines of the various tints are pounced each on a separate wood-block made of pear-tree, mounted on pine. These blocks are pressed on the sieves of colour, and then applied to the paper, each block following the other on the guide-marks left by the previous impression. An idea may be formed of the enterprise and labour required to produce some of the decorative paper-hangings for this Exhibition, by stating that more than 12,000 blocks have been employed on a single one of them.

In making flock-paper, the pattern is first printed in size, and then with a preparation of varnish or Japan gold-size. When this is partly dry, coloured flock, pre-

pared from wools, is sifted on the varnish pattern, to which it adheres. Great improvements have been made of late years in this manipulation, more especially by French manufacturers.

Paper-hangings, where gilding is introduced, are prepared much in the same way as for flock: the leaf metal is laid on the varnish pattern, or, if worked in bronze powder, it is brushed over with a hare's foot.

The English manufacturers have attained great perfection in the preparation of metal papers. The gilding, having to encounter the damp and variable climate, is most severely tested; but by means of good material, careful manipulation, and a preparation washed over it, it remains unchanged for a considerable period.

Paper-hangings have been printed in England by means of hand machines for many years, the papers being made in lengths of 12 yards, or single pieces, in one or two colours, and these colours falling separately on the ground. It was not until about ten years since what is now understood as machine printing was fully introduced, and this was done by Messrs. POTTER, of Darwen (74, p. 734), who, by means of steam-power, artificial drying, and an endless roll of paper, were enabled to produce patterns with good effect by surface-roller printing in several colours, on the principle of calico-printing: specimens showing 14 colours were exhibited by this house. Messrs. HEYWOOD, HIGGINBOTTOM, and Co., of Manchester (71, p. 734), have also effected great improvements in the manufacture, and exhibit patterns showing 20 colours made by 14 rollers; and Messrs. J. WOOLLAWS and Co., of London (322, p. 758), likewise exhibit excellent specimens made by machinery in addition to those they make by block-printing.

These machines are now each capable of printing from 1,000 to 1,500 pieces per day; and although the work is not equal to block-printing in the solidity or permanence of the colours, yet the small price at which it is produced commands an extensive sale, superseding to a great extent the cheaper kinds made by hand.

The above remarks apply only to paper-hangings of the cheaper qualities, for machine-printing has not yet been successfully applied to those with glazed or satin grounds. There is also another evil which it is most desirable to remedy—the colours are liable to run, without great care, in the hanging.

It is perhaps impossible to give the correct statistics of the manufacture of paper-hangings. A statement has, however, been prepared with some pains by M. Zuber, of Rixheim, which approximates to the actual condition of this branch of industry in the principal countries of Europe and in the United States; but is founded on rather loose data in reference to this country, the result of whose products I am convinced it understates.

STATISTICS OF PAPER-HANGINGS, 1852.

| COUNTRY.                 | Number of Tables. | Number of Machines. | Workmen. | Number of Pieces produced. | Value in Pounds Sterling. | Mean per Piece. |
|--------------------------|-------------------|---------------------|----------|----------------------------|---------------------------|-----------------|
| Great Britain            | 600               | —                   | 1,900    | 2,300,000                  | 300,000                   | 2 7             |
| Ditto                    | —                 | 20                  | 100      | 3,200,000                  | 100,000                   | 0 7             |
| France                   | 1,200             | —                   | 4,500    | 6,000,000                  | 330,000                   | 1 1             |
| Ditto                    | —                 | 12                  | 50       | 200,000                    | 8,000                     | 0 9½            |
| Zollverein               | 300               | 6                   | 1,200    | 2,600,000                  | 80,000                    | 1 0             |
| Belgium                  | 150               | 6                   | 600      | 600,000                    | 40,000                    | 1 4             |
| Holland                  | 50                | —                   | 200      | 250,000                    | 12,000                    | 0 11            |
| Switzerland              | 30                | —                   | 100      | 100,000                    | 4,000                     | 0 9             |
| Austria                  | 60                | —                   | 250      | 250,000                    | 24,000                    | 1 11            |
| Piedmont                 | 40                | —                   | 150      | 200,000                    | 8,000                     | 0 9½            |
| Russia                   | 100               | —                   | 400      | 500,000                    | 60,000                    | 2 4½            |
| Denmark                  | 30                | —                   | 100      | 100,000                    | 8,000                     | 1 7             |
| Spain                    | 100               | —                   | 400      | 400,000                    | 28,000                    | 1 5             |
| United States of America | 400               | —                   | 1,250    | 4,000,000                  | 160,000                   | 0 9½            |
| Ditto                    | —                 | 40                  | 50       | —                          | —                         | —               |
| Total                    | 3,060             | 84                  | 11,250   | 19,700,000                 | 1,162,000                 | —               |

There are very beautiful specimens of paper-hangings in the Great Exhibition; works which not only possess considerable artistic excellence, but also show great progress in the manufacture.

France has justly acquired a high renown for her works in this branch of industry. M. DELICOURT, of Paris, (1715, p. 1258), exhibits a tapestry-like picture entirely printed by blocks, representing a chase in a forest, surrounded by a rich ornamental frame, with pilasters containing animals, birds, and attributes of the chase: 12,000 blocks were required to execute this most creditable work. He likewise exhibits flower decorations entirely executed in flocks, of which there are about 70 different shades; also very beautifully-finished plain flock-papers, called silk and wool. His two bas-reliefs of the *Descent from the Cross* and the *Resurrection* are good specimens of printing.

M. ZUBER, of Rixheim, France (1536, p. 1250), exhibits one of his beautifully-executed landscape papers—one of a series of works for which this house is so celebrated: it represents the floral vegetation of the four quarters of the globe, and the richness and brilliancy of the colouring and the perfect workmanship are alike remarkable. M. Zuber also exhibits many other excellent specimens of the various kinds of paper-hangings, &c.: he is, besides, the author of many improvements in this trade.

Messrs. MADER, of Paris (327, p. 1192), exhibit a picture representing a garden scene—a very clever example of paper-printing, left, perhaps purposely, in a state where a few touches by the hand of a clever artist would complete a beautiful effect. A well-executed figure in a panel, and other decorations of flowers and ornaments, besides some specimens of the more ordinary kinds of paper-hangings, attest the skilled workmanship of this house.

The English manufacturers of paper-hangings have produced many beautiful specimens also, both as decorative, damask, chintz, and flock-papers; those made by machinery have been previously alluded to.

Messrs. TOWNSEND and PARKER, of London (318, p. 758), exhibit paper-hangings of various kinds, of considerable beauty in design and execution: two of their decorations introduce fruit flowers, and arabesque ornament of excellent execution. Messrs. HIRSCHLIER and Co., of London (314, p. 757), have also produced good specimens of decorative and other paper-hangings; and the collections of Messrs. W. WOOLLANS and Co. (309, p. 757) J. WOOLLANS and Co. (322, p. 758), and Messrs. TURNER and Co., include many examples, showing that the art is well carried on in this country.

Messrs. SPRÜNGIN and ZIMMERMANN, of Vienna (651, p. 1441), exhibit paper-hangings decorations for ceilings, &c., in good taste. They have also adapted the process of block-printing in distemper colours, as a cheap form of illustrating works of science and art: the specimens they exhibit give illustrations of machinery in isometrical perspective, very beautifully executed.

M. DEVIS, of Brussels (Belgium, 401, p. 1163), exhibits a large collection of paper-hangings, more particularly in flock, of excellent execution.

MM. RAUN and VETTER, of Warsaw (Russia, 262, p. 1375), have forwarded a collection of paper-hangings, which possess considerable merit, both as regards design, colouring, and execution.

#### Japan Ware. • • •

The articles under this head form an interesting series, and include the products of India, China, France, Germany, and England.

Japan ware may be divided into two classes: works lacquered upon wood or metal grounds, and those formed of papier maché; these last are superior to the former, being lighter, sounder, and admitting of a more beautiful finish.

Japan ware derives its name from the lacquered ware manufactured in Japan, and introduced into Europe towards the end of the seventeenth century. The lacquered work of that country is of a superior description; some of it higher in quality even than the Chinese, which is also very beautiful, and is very extensively manufactured.

It is called lacquered ware because the articles are coated with varnish prepared from lac. This lac is a

resinous gum, the sap of a shrub Tsei-shoo (*Rhus vernix*) in Japan, and of the *Angia Sinensis* in China; the juice thence extracted is of a poisonous nature, and great caution is required in collecting it.

The method of applying the lacquer in China is pursued as follows:—"The article to be ornamented, if formed of wood, is always very dry, light, and smooth: it is first coated with a preparation of ox-gall and rotten-stone; this is rubbed to a smooth face and then varnished. This varnish is thus composed: 605 grains of fine gum lac are put in 1,200 grains of water, to this is added 38 grains of oil of Camellia sasanqua, a pig's gall, and 19 grains of rice vinegar. The whole is well mixed in full daylight, the lac gets deeper and deeper, and the varnish shortly becomes a brilliant black; a very thin coat of this is laid on with a flat hair-brush. The article is left in a steamy heat, and at length comes into the hands of a workman who rubs it down in water with very fine pumice. The work then receives a second coat of the lac varnish, and after that a second polish, and these two operations are successively continued till the surface is perfectly even and brilliant. As the operation advances, a still finer quality of lac is used: there are never less than three coats laid on, nor more than eighteen. The decoration of the object is confided to an artist workman, who first draws in the design with white-lead; if he is satisfied with the sketch, he engraves it, and fills in the thousand little details of the subject. There then remains only to paint with the camphorated lac of Kouang-si, which serves as a mordant on which to gild either with Kuf-gold or powder. The reliefs are obtained with one or two coats of ho-kim-tsi, and these gilt designs are then enriched with the lac of Po-kiem."

Little is known of the fine lacs of Sou-tchou and of Nam-king: the price is very high; this is explained by the cost of the work, which requires the application, the hardening, and the polishing alternately of eighteen or twenty coats. In their lacquered objects the purity and brightness of the varnish, the infinite minuteness of the decoration, and the finished workmanship of the furniture, are most admirable. In the work from Japan, pieces of mother-of-pearl cut to form are inlaid in the lacquered grounds, and the last coats of the varnish are polished with a reed.

Several interesting specimens of Japan ware are exhibited from China, particularly a very elaborate folding screen by Mr. BRAINE (19, p. 1424).

England has obtained some celebrity for her Japan ware executed in papier maché. About a century ago, Mr. Baskerville, of Birmingham, manufactured extensively japanned iron tea-trays, &c., and a pupil of his, named Clay, first invented papier maché, as applied to this particular manufacture in 1760, and obtained a patent for the same: to this invention is owing the importance which this branch of trade has acquired, not only from the greater perfection of form and appearance this material is susceptible of, but also from the larger variety of articles to which it can be applied.

Messrs. JENNENS and BERRIDGE, of Birmingham and London (187, pp. 748, 749), are the largest manufacturers of this material in England; they have been established about fifty years, and have introduced many improvements. About thirty years since they obtained a patent for a new application of pearl to Japan ware, and this firm have, from their enterprise and taste, greatly developed the trade by adapting this material to many new purposes. Tables, chairs, screens, work-boxes, inkstands, portfolios, even a piano, are among the endless variety of objects to which it is applied by them. They exhibit a very large collection of japanned ware, executed both in papier maché and other materials; the most conspicuous among them is a cottage pianoforte, of which the entire case is made in papier maché, japanned black, and inlaid with mother-of-pearl: the ornaments of this piano are in good taste and well executed, but scarcely suitable in style for the materials employed, which, being necessarily in small

\* I am indebted to an article by M. Natalis Rondot, of Paris, one of our Jury, for this description of the Chinese mode of japanning.

pieces, would have probably, told with better effect if arranged in the form of mosaic. A wine-tray, and many others of the specimens where the principles of the design are perfectly flat, are excellent examples. In some of the work-boxes, too, the introduction of the jewelled work under glass is appropriately designed and well executed, and forms a pretty addition to the papier maché. The style of work of some of the large objects, such as a reclining chair, a cot, tables, &c., however well designed and ingeniously executed, did not appear suitable to the material. The Jury, nevertheless, recognise the great merit due to this house, and felt pleasure in awarding the Prize Medal.

In 1832, Mr. Brindley, of Birmingham, obtained a patent for producing papier maché articles by pressure between dies, either in wet sheets or in the form of pulp; this is employed for a cheaper kind of objects.

In France this manufacture has also obtained considerable success, though there are no objects exhibited. In Holland, Belgium, the Zollverein, Austria, the art of jappanning is carried on, but not so extensively as in England.

The mode of manufacturing the papier-maché Japan ware in this country may be thus briefly described:—paper of a porous texture is saturated with a solution of flour and glue, and then applied to a mould somewhat smaller than the object required; these moulds are of iron, brass, or copper: repeated layers of this paper are made to adhere by means of the glue, a drying at 100 degrees of Fahrenheit taking place between each coat. When the proper substance is obtained, it is taken from the mould and properly planed and filed to shape; the thickness of the article varies according to circumstances: an ordinary tea-tray takes about ten layers; a varnish, mixed with lamp-black, is now laid on, after which the article is stoved; several coats of this varnish are applied, followed in each case by a stoving. When sufficiently covered with this preparation, the inequalities are removed with pumice-stone, and the work of the artist commences; after he has executed the design, either in bronze powder, gold, or colour, as may be desired, several coats of shell-lac varnish are applied, and this is hardened in the stove at a heat of 280 degrees Fahrenheit. The article is now rubbed with rotten-stone and oil to obtain a polish, and perfected to a brilliant surface by rubbing with the hand.

Associated with the papier-maché ware is the introduction of imitation jewels on coloured grounds under glass; these are cemented to the under surface of the glass, which is also dispersed over with gold, and the ground is then painted the required colour, a foil being fixed behind the glass jewels.

Another variety has also been lately introduced; that, where laminae of mother-of-pearl are fixed behind glass, and so associated with the pictures or ornaments as to produce very beautiful effects. Mr. LANE, of Birmingham (128, p. 742), exhibits some excellent examples of this work.

Messrs. CLAY and Co., of King Street, London (189, p. 749), are the representatives of the descendants of those who invented this manufacture; they exhibit a large selection of articles of papier maché, among which many of the ten-trays are of very good design and execution.

Messrs. HALLIBRAND and WELLINGS, of Birmingham (131, p. 312), exhibit a handsome toilet table in the Elizabethan style inlaid with mother-of-pearl, in addition to many other specimens.

Mr. WALTON, of Wolverhampton (Class XXII., 701, p. 668), exhibits some ten-trays of good design, where the principle of the ornamentation is founded upon geometric forms, depending on outline and contrast of colour, not on imitation of relief. The large table in papier maché, well painted in flowers, is also a fine specimen of the manufacture.

Messrs. SPICERS, of Oxford (70, p. 734), exhibit numerous examples of papier maché, many of them beautifully ornamented.

Messrs. BECKER and KRONICK, of Vienna (643, p. 1040), exhibit jappanned screens well executed, besides other objects.

Messrs. ZEEGERS, of Amsterdam (96, p. 1148), exhibit a folding screen, in which the execution of the various details is excellent, and the peculiarities of the Chinese work admirably sustained.

This Jury feel called upon to remark on the redundancy and inappropriateness of much of the ornament applied to the European specimens of Japan ware; and to direct attention to the better examples of this work from Japan and China, where it will be found that in the subordinate parts the ornament is kept subdued and simple, thereby giving more effect to the principal features.

#### *Ornaments in Relief Mechanically Produced.*

Under this head are included ornaments in Carton-pierre, in papier maché, and in stamped leather; and carving produced by machinery. The first of these, *Carton-pierre*, has but recently been manufactured in England, although employed for nearly forty years in France; it is an important introduction for architectural decoration from its lightness, strength, facility of application, and other advantages. It is composed of the pulp of paper mixed with whiting and glue; this preparation is pressed into plaster piece-moulds, backed with paper, and then, when sufficiently set, removed to a drying-room to harden. The manufacturers of Paris have, since the invention of this material, executed in it works of great extent and beauty of design; it has the advantage over plaster of Paris, that it is stronger, lighter, and perfectly hard, and dries in a few hours.

M. CURCIET, of Paris (810, p. 1219), exhibits an enriched frontispiece, ornamented with groups of dead game, and various other specimens of great merit.

M. HENRI, of Paris (879, p. 1221), exhibits a frieze of foliage ornament and children, of beautiful design, and also various specimens of pilasters, ornaments, &c.

M. GROPIUS, of Berlin (226, p. 1060), exhibits several statues executed in this material, and also various ornaments.

Messrs. JACKSON and SONS, of London (5, p. 730), are the first who have extensively manufactured this material in England, and have through its means been enabled to produce a series of ornaments that have added much to the character of art in this country: they exhibit many specimens; a part of their decoration at the Army and Navy Club—a chandelier—an Elizabethan ceiling, and many other objects; but one of the firm being on the Jury, they could not be rewarded by a Medal.

Papier maché, as used for architectural works in England, differs in some respects from the ordinary material known by that name. It is prepared by laying sheets of brown paper one over the other, a coat of glue being given between each. These sheets of paper thus glued together are then pressed into a metal mould of the ornament required; the papier thus stamped to shape is afterwards trimmed; a composition of the pulp of paper mixed with resin and glue is now put in the mould before used: the papier maché ornament, previously stamped, is again inserted, and is again pressed upon the pulp composition, which thus adheres to it, and produces a sharp, well-defined ornament.

Messrs. BIELFELD, of London (157, p. 744), exhibit many specimens of this manufacture, as do also Messrs. JACKSON and SONS, before mentioned.

#### *Stamped Leather.*

The manufacture of this material was revived about fourteen years since at Paris, with many improvements upon the old leather hangings of the seventeenth and eighteenth centuries, as regards the perfection of embossing the ornament.

The old leather hangings were made by a comparatively simple process, without the aid of machinery. The skins being properly moistened, were laid on a mould of the embossed ornament: into the various parts of this mould the leather was pressed by small wooden tools, till it acquired the embossed pattern; when dry, the leather was coated with silver-leaf, and varnished with lacquer to produce the colour of gold. After this the proper

colouring was laid on by hand, and certain parts of the leather stamped by a hand-punch to produce the small figure peculiar to some kinds.

In the French revival of this manufacture the ornament is stamped by hydraulic pressure, producing very perfect and very high relief: to prevent the relief subsiding as the leather dries, the reverse of the leather is covered in the embossed parts with some composition.

Messrs. DULON, of Paris (1902, p. 1285), at present represent the house which first manufactured by this improved process: they exhibit many specimens of good design, and showing the excellence of the emboss.

Mr. LEAKE, of London (Class XXX., 62A, p. 823), also exhibits a collection of specimens of leather embossed by the same process, many of them of good design.

#### *Carving by Machinery.*

Messrs. JORDAN and Co., of London (80), exhibit various specimens of carved work executed by machinery, a large Gothic oak screen, dead game, foliage, &c. The operation of this machine is by a series of drills, pointed from a model: where there is a considerable repetition

of the same ornament, this machinery can be employed with very great economy, but the work requires finishing by hand.

#### *Conclusion.*

The Jury have carefully examined the various works in this Class, numbering probably more than five thousand objects; there were many works of very considerable cost and labour, which they would have been pleased to reward if they could have done so conscientiously, but they considered that it was not the size or the amount of labour in the object that should entitle it to distinction, but rather the merit of pure design, of execution, or of contrivance.

The Jury unanimously regretted the withdrawal of the Third Medal; if this had been retained they would have been able to discharge their duties more satisfactorily to themselves, and they think also to the exhibitors. They are bound to add, that they were only empowered to recommend certain names for the distinction of the First or Council Medal, and that the Council made a selection from that list.

### AWARDS IN CLASS XXVI.

#### THE COUNCIL MEDAL.

| NATION.       | Number in Catalogue | NAME OF EXHIBITOR.         | OBJECTS REWARDED.                    |

PROFESSOR ROESNER, } JOINT REPORTERS.  
J. G. CRACE,

London, January 1852.

## CLASS XXVII.

## REPORT ON MANUFACTURES IN MINERAL SUBSTANCES, USED FOR BUILDING OR DECORATIONS, AS—IN MARBLE, SLATE, PORPHYRIES, CEMENTS, ARTIFICIAL STONES, CLAY, &amp;c.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

## Jury.

BENEDETTO PISTRUCCI, *Chairman*, Italy; Royal Mint; Her Majesty's Chief Medallist.

LORD SUDBURY, *Deputy Chairman*, 35 Dover Street.

D. T. ANSTED, F.R.S., *Reporter*, 17 Manchester Street, Manchester Square; Professor of Geology, King's College.

BERNARDO DI BERNARDIS, Austria; 43 Clarges Street; Architect.

GEORGE GODWIN, F.R.S., 24 Alexander Square, Brompton; Architect.

SIR CHARLES LEMON, Bart., F.R.S., M.P., 46 Charles Street, Berkeley Square.

EMMANUEL PSYCHA, Greece; Civil Engineer, and late Professor of Physical Sciences.

VISCOUNT HERICANT DE THURY, France; Member of Institute.

## Associates.

F. BARKER, 71 Lower Grosvenor Street.

G. H. HENRY, F.R.S., 18 Lincoln's-Inn-Fields; Analytical Chemist.

GEORGE LOWE, C.E., F.R.S., 39 Finsbury Circus; Engineer to Chartered Gas Company.

THE objects taken into consideration by the Jury of Class XXVII., and defined by the general term *Mineral Manufactures*, have been understood to embrace a very great variety of articles manufactured in stone, marble, and clay. These may be, conveniently enough, grouped into two principal divisions: the one including all dressed, carved, sculptured, and polished work in solid material; whether stone, marble, granite, or other mineral substance; and whether solid, wrought, or inlaid in stone; while the other includes modelled and moulded work in clay, cement, certain kinds of glass and pottery, and artificial stone. The difference is essential between these two kinds of work, which are rarely undertaken by the same artist. Each of these divisions is capable of arrangement into groups, as follows:—

## DIVISION I.—Works in Solid Material.

## Group 1. Unpolished stone.

- „ 2. Polished and inlaid work in stone, marble, granite, and *pietra dura*.

## DIVISION II.—Works in Plastic Material.

## Group 3. Cements and artificial stone.

- „ 4. Clay.

To these there may also be added a group of 'miscellaneous,' which will not be found very numerous.

It will be convenient still further to subdivide these groups in speaking of the exhibitors, *seriatim*, and the lists may be arranged in the following order:—

## DIVISION I.

## Group I.—MANUFACTURES IN UNPOLISHED STONE.

- A. Flagstones, pavements, &c., roughly dressed.
- B. Carved and sculptured works in freestone, granite, &c.
  - a. Large monumental works.
  - b. Smaller works in granite.
  - c. Works in Caen stone.
  - d. Works in Bath stone.
  - e. Sundry works in freestone.
- C. Slate.
- D. Sundry materials.

## Group II.—MANUFACTURES IN POLISHED STONE, MARBLE, AND OTHER SIMILAR MATERIALS.

## E. Manufactures in marble and alabaster.

- a. Collections of marble.
- b. Chimney-pieces.
- c. Columns, pedestals, &c.
- d. Slabs, tables, &c.
- e. Sundry objects.

## F. Works in ornamental stone, granite, and spar.

- a. Serpentine, granite, and porphyry.
- b. Jasper, jade, agate, crystal, and spar.

## G. Mosaics, or inlaid work in stone.

- a. Inlaid work in *pietra dura*.
- b. Inlaid work in marble.
- c. Inlaid work in malachite.

## H. Polished and enamelled slate.

## DIVISION II.

## Group III.—MANUFACTURES IN CEMENTS, SCAGLIOLA, AND ARTIFICIAL STONE.

## I. Massive and entrusted cements, scagliola, and plasters.

- a. Hydraulic cements.
- b. Plasters and scagliola.
- c. Artificial stone with silica base.
- d. Aluminous cements.
- e. Metallic cements.

## K. Glass and porcelain mosaics (including Roman mosaic).

- a. Roman and Venetian mosaic.
- b. Porcelain mosaic.

## Group IV.—MANUFACTURES IN CLAY.

- L. Bricks and tiles.
- M. Terra cottas.
- N. Fire-clay goods, unglazed.
- O. Glazed fire-clay goods.

It will at once be seen from this arrangement how considerable a variety of subjects must be treated of in this Report, and the important relation they bear to almost all questions of construction and decoration. With the exception of those building stones which are included in Class I. as "raw materials," the whole series of non-

metallic mineral substances used for construction and decoration, may be considered as referred to Class XXVII., and it will be found that many manufactures of great interest require to be described and discussed.

The Reporter—not having the requisite technical and statistical knowledge of all these manufactures, himself—has endeavoured in various cases to obtain it from authentic sources; and where any new method has been introduced by exhibitors, he has attempted to make himself acquainted with it. He has also tried to obtain and communicate information, wherever there appeared anything remarkable in the manufacture, even where this was not, in any sense, new. The Report will thus contain the result of various inquiries, as well as the observations of the Jury, on the different objects considered worthy of special notice.

In order to assist them in coming to a right decision on some subjects as to which they required technical information, the Jury have called in, as Associate Jurors, the following gentlemen, to whom they beg, here, to offer their best thanks for the valuable assistance rendered:—

F. BARKER, Esq., for polished marble and inlaid work.

T. H. HENRY, Esq., F.R.S., for chemical utensils.

GEO. LOWE, Esq., C.E., for fire-clay goods.

It is difficult, amid such a multitude of objects, of natures so widely differing, to offer any useful general remarks on the whole Class. Apart from the works forwarded by English exhibitors, whose number more than equis that from all other countries together;—(and who have sent much that is interesting in carved stone, slate, granite and porphyry, serpentine, mosaic work, cement and scagliola, bricks, fire-clay goods, and salt-glazed ware;—) it may, however, be well to allude particularly to the malachites and jaspers of Russia; the mosaics of Italy and India; the bricks of Austria; the carved stone of Malta; and the terra cottas of France, as among the most important of the objects exhibited from abroad. The selection of material, and the method and perfection of the workmanship, have generally entered into the consideration of the Jury, as well as the adaptability of the material, and the economical production of a useful manufacture; and thus will occur that here, as in other cases, similar prizes have been awarded to objects of very different degrees, as well as different kinds of merit.

In their recommendation of objects for the Council Medal, the Jury have thought it their duty to limit themselves to such as exhibited decided novelty, in addition to great merit of design and execution. The claims of the SOCIETY FOR THE IMPROVEMENT OF THE DWELLINGS OF THE LABOURING CLASSES (124, pp. 774, 775) are so considerable in both respects, as well as in an economic point of view, that they have been at once admitted. They involve a vast improvement in style, safety, and cheapness in the construction of dwelling-houses, and this in the very cases where improvement was most needed, and most likely to conduce to decided sanitary improvement among the great masses of town populations.

To Mr. MINTON (86, p. 770) we are indebted for introducing very many and important improvements in encaustic tiles, thus restoring a manufacture which had long been extinct, by the application of a method more generally available than that originally adopted; and to his enlightened appreciation of merit many modern improvements in pottery are due;—these claims were fully recognised by the Jury and Group of Jurors, who recommended the award of a Council Medal, which was conceded by the Council of Chairmen jointly with that recommended by another Class (Class XXV.) for articles directly connected with the manufacture of porcelain.

With regard to the manufacture of Roman mosaic it need not be inquired whether the finished work of art by the Cavalier BAZZANI (Rome, 18, p. 1236), selected as also worthy of the Council Medal, is really the most perfect in its kind, or more excellent, both in design and execution, than any that exists in this country; since we may safely say that it is of the very highest order of merit,

while the manufacture itself, though not modern, nor involving any peculiar novelty, has in this case the advantage of originality of design and great ingenuity in treatment and execution.

The remaining group of objects to which a similar reward has been voted, namely, the collection of Russian malachites exhibited by the Messrs. DEMIDOFF (Russia, 323, pp. 1377—1381), offers examples of a manufacture remarkable not only for the rich magnificence of the articles, but also for a great improvement in style and execution which will be afterwards explained; so that little doubt could exist as to the propriety of rewarding the exhibitors with a peculiar mark of distinction.

If it had been possible to do so, the Jury would also have been glad to mark in the same way the great importance they attach to the extensive and admirable manufacture of bricks, belonging to Mr. MISERACH, of Vienna (610, p. 1038); to the remarkable works in jasper and hard porphyry, exhibited from Russia and Scandinavia; and to some of those beautiful and admirable works in pietra dura, sent by the Florentine artists; but the regulations not admitting of this, they can only here allude to these objects as among the most remarkable in their class, and proceed at once to discuss the various groups of objects in regular order, stating the reasons which have guided them in recommending some for reward.

Before concluding these preliminary remarks, the Jury wish to record their admiration of the rare works of manufacture, belonging to this Class, exhibited by the Honourable East India Company (p. 921). Among the various examples of inlaid work in pietra dura, not one is more perfect in its kind, or exhibits more delicate and artistic taste, or greater mechanical excellence, than a small chess-table in their collection. Next to this, they may mention as remarkable for delicacy of workmanship, the manufactures in a peculiar white marble of considerable beauty, cut into garden-seats, &c., and also many smaller objects, and utensils hardly less striking. The ousps and other vessels, and various ornaments, manufactured of jade and crystal, and for the most part inlaid with rubies and emeralds, are examples of great labour and ingenuity applied to a manufacture rare in this country, and in Europe generally, but long known and exercised in the East. For these, and many other manufactures, the Exhibition is indebted to the exertions made by the officers of the East India Company, acting on the instructions received from the Court of Directors in England. The Jury regret, however, that their ignorance of the names of the manufacturers has prevented them, in many cases, from rewarding them with Medals and Honourable Mention.

#### DIVISION I.—WORKS IN SOLID MATERIAL.

##### Group 1.—MANUFACTURES IN UNPOLISHED STONE.

The total number of exhibitors in this group is upwards of eighty, of whom about sixty are British, five Maltese, and a few from India. The remainder are distributed as follows:—five French, two Belgian, two Italian, and one from Austria, Sweden, Spain, China, and the United States. The objects being for the most part heavy, and of rather large dimensions, the cost of transport has no doubt checked the transmission from a distance of many that might otherwise have been sent. But it must also be stated, that several of the raw materials properly referred to Class I. might have come under consideration here if they had not been so manifestly connected with that Class; while, on the other hand, some, though but few, of those now regarded as sculpture, &c., might almost be claimed for the present Class and group.

Many of the most interesting objects are of very great—almost national—importance, and some are certain to have attracted much notice; others again are small, and offer little at first that is likely to command attention.

##### A. FLAG-STONES, PAVING-STONES, &c.

Most of these objects may be considered as partly referable to Class I., and are reported on by the Jury

for that Class, so far as the nature and value of the raw material is concerned. At present it is rather in reference to the method of manufacture and relative value when made into pavement, that they have to be considered; and the reader is referred to the annotations in the Illustrated Catalogue for some information regarding the nature and geological position of several of the more interesting among them.

The British paving-stones exhibited may be grouped as follows:—(1.) Yorkshire flags. (2.) Caithness flags, and Arbroath pavement. (3.) Manx flags. (4.) Irish flags. (5.) Welsh flags. (6.) Welsh road material from Penmaen-mawr; and (7.) Scotch granite paving. Some road-stuff is also exhibited in a rough state from several localities in Cornwall, but more as samples of what is already well known and used than illustrations of any new material or locality.

The Yorkshire flags—paving-stones of great importance in England—are obtained chiefly from a part of the carboniferous system of rocks developed in various parts of the county. They are remarkable for size, hardness, and toughness. The only exhibitors of such stones on a large scale are Messrs. BROWN, RUGBY, and BOOTH, of Sheffield (Outside, 29, p. 115),\* who are Honourably Mentioned on account of excellence of material and its adaptability to the required use.

The Caithness flags and Arbroath pavement are obtained from the old red sandstone rock, developed in the north and east of Scotland. The former consist of dark-coloured and bituminous schists, slightly micaceous and calcareous, abounding near Thurso, and remarkable for toughness and durability. The latter are also rather dark-coloured, although much paler than the Caithness, and are of very different quality; but they are also derived from the lower part of the old red sandstone series. Few flags are more useful than these, and they are happy illustrations of the excellence of the old red sandstone, generally a barren rock, for at least some important purposes. The Jury think it right to direct special attention to Mr. SINCLAIR's large series of the Forss Rockhill flags from Caithness (Outside, 13, p. 114), and also to Mr. CARNEGIE's series of Arbroath flags (Outside, 20, p. 115), as in both cases offering excellent specimens on a large scale, of a very useful material. For this reason they consider that both are deserving of Honourable Mention.

The Manx flags of QUILLIAM and CREER (Class I., 151, p. 136), although not exhibited so largely, are worthy of being alluded to in this place. The following

\* The Reporter has found it difficult to obtain definite information with regard to this very important product of Yorkshire. By inquiries made with the kind assistance of T. Wilson, Esq., of Crumbers House, Leeds, assisted by the Rev. T. Thorp, he has obtained a list of 92 quarries in the vicinity of Leeds, Bradford, Wakefield, and Halifax, occurring in a thickness of from five to six hundred yards at the bottom of the coal measures, and upwards of fifty of them supplying flags and landings. The stones known as Yorkshire stones may be divided into two classes, called respectively grit stones and free stones, the latter being also sometimes called delf. Of one of these the Bramley Fall Stone (Class I., 190) is a fine example, being coarse-grained, hard, shining, and containing mica, obtained in large blocks but not laminated. The true flags are illustrated as raw material in Class I., 172, Elland flagstone, &c.; the specimens being fine grained, laminated, and cleaving into flags varying in thickness from two to three, six, or eight inches. It is stated by Mr. Wilson, that all the beds from the millstone grit upwards to the Barnsley thick coal are freestones, stratified and often splitting on the planes of stratification and alternating with beds of coal. Between the best flagstones and the millstone grit are some of the coal seams, such as the Halifax coal and the Halifax soft coal. The flagstones are of course those beds most remarkable for their fissile character, perfect evenness of texture, fineness of grain, toughness and hardness, and in many cases they can be obtained of very large dimensions. Leeds may be considered the centre of the district supplying the greatest quantities. The quarrying and dressing of these stones requires some practice and ingenuity, and the specimens laid down outside the Exhibition Building, and exhibited by Messrs. Brown, Rugby, and Co., are of very good quality.

information has been obtained from the Rev. J. G. Cumming (Vice-Principal of King William's College, near Castletown, Isle of Man), who has strenuously exerted himself to obtain a fair representation of the industrial products of the island, and who writes as follows:—“The black flagstone of Poolvaah” (found on the south side of the island, near Castletown, and belonging to the carboniferous limestone) “is a bed whose thickness varies from a few inches up to 20 feet. It is too soft to take a polish, and is generally finished with lamp-black and oil, or, in some cases, with French polish. It is very easily wrought, and its durability is well seen in the steps of St. Paul's Cathedral (presented about the commencement of the last century, by Bishop Wilson).” Messrs. Quilliam and Creer have the lease of the quarries from the Crown, and their works are in Castletown, on the sea-shore, at a convenient place for shipment. The cost of the plain slabs for hearths, &c., at the place of shipment, is 10d. per square foot. Inlaid with a hard composition in patterns, as exhibited in Class I., No. 151, the cost for the same pattern as the national tile is 2s. 3d. per square foot.

Besides the bituminous limestone, there is a flagstone worked at Spanish Head, not far from Castletown, obtained from rocks of the older Silurian date. Though soft and slightly elastic, and worked with great facility, it is very durable, as shown by the Runic monuments in various parts of the island. It has been used for flooring, and is admirably adapted for prison-cells. In addition to these materials, the granite of the island is considered to be very useful for curbstones and paving.

The Irish flags exhibited are few, and hardly sufficient to justify any extended description. The principal are those sent by Mr. FRANKLIN, of Galway, and appear to be of good quality (Outside, 17, p. 114).

The Welsh paving-stone from Penmaen-mawr is remarkable as being both the hardest and toughest material for road-stuff that has yet been discovered. It is indeed so hard as to assume a glassy surface after long-continued exposure, and actually becomes dangerous from this cause. It is a trap-rock, and appears to be abundant. Mixed with less hard material, it might in many cases be a most useful addition to our present resources in London.

The specimen of Scotch granite paving exhibited by Mr. SIM (Class I., 137, pp. 135, 136) is of excellent quality, and is well put together. It involves a new mode of construction, and is well executed. The material is adapted to withstand much wear, and the method of laying down is novel in design, whatever the opinion may be as to its applicability. The Jury have made Honourable Mention of the pavement of this exhibitor, as well as that of Mr. SINCLAIR, as both of them exhibit to some extent finished constructions, or working models of such objects.

Some beautiful specimens of slate flags from the quarries at Festiniog, North Wales (12, p. 114), are worthy of Honourable Mention (awarded a Prize Medal by Class I.), and careful attention, as presenting a cheap and admirable pavement of great beauty, and in slabs so large as to prevent much chance of an irregular surface being produced when much used.

The flags are of fine quality, and have had a severe trial at the Transept entrance of the Building, where some millions of footsteps have hitherto failed in producing any mark of unequal wear.

It is not astonishing that material of the kind we are now considering, hardly appears except from the various parts of our own country. From Belgium, Messrs. ZAMAN (156, p. 1155) have forwarded models of paving-stones and other manufactured stone of this kind, and of them the Jury make Honourable Mention.

A pavement is exhibited by M. DERAUGES (France, 1184, p. 1234), manufactured of a stone called Pierre de Tonnerre. It is in compartments, tolerably large, and well executed, the material being well adapted to the purpose. The same exhibitor sends also a chimney-piece and other works, which will be described elsewhere.\*

**B. CHISELLED, CARVED, AND SCULPTURED STONE-WORK, NOT POLISHED.**

*a. Large Monumental Works, chiefly constructed of Granite.*

These noble monuments, of excellent material and good workmanship, and remarkable for the public spirit which induced their respective owners to incur very great expense in preparing and transmitting them, may be considered as permanent records of the good feeling that has been perhaps the most characteristic feature throughout the preparation of the Great Exhibition. Three of these objects, of large size, are from Cornwall, and are fine specimens of the granites of that county. Another is a highly-interesting and more finished specimen of Swedish granite, by no means so large as the former, but hardly less remarkable. There is also one exhibited in the Nave, constructed of Caen stone.

The granite column sent by the **CHEESEWING GRANITE COMPANY** (Outside, 54, p. 117) is a very beautiful specimen of a stone obtained from quarries hitherto little worked, on property belonging to the Prince of Wales, near Liskeard, Cornwall. The shaft, cut from a single block, and worked at the quarry, is highly creditable; and the pedestal and base, worked in London, are in good proportion and well executed. The capital is rather heavy. The total height of the column, pedestal, and base is about 30 feet. For the material, style, and workmanship of this column the Jury have awarded a Prize Medal.

The obelisk sent by Messrs. W. and J. **FREEMAN** (Outside, 14, p. 114) is from Lammorna granite quarries, Cornwall, well known for their excellent material. Its height is upwards of 22 feet, and its weight 21 tons. It is placed on a block of Carnsew granite, weighing 31 tons. The difficulties and expense incurred in quarrying, removing, and placing objects of these enormous dimensions can hardly be judged of by those who merely see the finished result. The preparation and erection of an obelisk formerly the work of years, and still involving enormous labour and trouble, was, in this case, completed within a few months, merely as a sample of the nature of the material and the resources of the exhibitor. A Prize Medal has been awarded for this work.\*

Mr. **HOSKEN's** obelisk (Outside, 75, p. 118) is from No. 2 granite quarry in Carnsew, near Penryn, the property of the exhibitor. It is 18 feet high, about 3 ft. 5 in. square at the base, and 1 ft. 6 in. square at the top. The weight is about 6 tons, and it stands on a granite block from No. 14 quarry in Killievea, in the parish of Constantine, also weighing about 8 tons. Both granites are of excellent quality, that of the obelisk more especially, the grain being fine, and the colour very good. A Prize Medal has been awarded.

The cross exhibited by Mr. **KULLOFTEN** (Outside, E. 100, and Sweden, 118, p. 118), and worked from a single block of granite, is remarkable for the extreme fineness and closeness of grain of the stone, and the delicacy of finish which its texture permits. The stone is obtained from extensive quarries on the island of Malmon, on the west coast of Sweden, whence the transport to this country is easy and cheap. It bears a high polish, and the cost of wages in the district whence it comes being very low, there is good reason to believe that it might be exported with advantage. The actual cost of a similar object has not, however, been ascertained. The Jury have awarded a Prize Medal to the exhibitor of this monument.

*b. Smaller Miscellaneous Works in Granite, Porphyry, &c.*

Concerning these objects, the Jury have but few remarks to offer. The cenotaph exhibited by Messrs. **POZ-**

\* It was probably owing to some accidental misapprehension of the state of the case that the Medal awarded to Messrs. Freeman for their noble collection of building stones in Class I. was withdrawn in favour of the obelisk in Class XXVII. The Jury of Class XXVII. awarded the Medal for the obelisk as a manufactured block of granite remarkable for its dimensions; but according to the general rule adopted in other similar cases, the award of Class I. should have been retained, the Exhibitors being merchants and not manufacturers.

**LEU BROTHERS** (France, 863, p. 1225), to which the Jury have awarded a Prize Medal, is a small object constructed of a kind of greenstone trap, whose chief merit arises from the difficulty of working a material so hard and tough. The style selected is impure Gothic, with several figures, and some open work. The execution is more elaborate than successful, and the work is left with a smooth face, without any attempt at further detail. Some of the small figures are fairly sculptured. The colour and general effect are not very pleasing. The establishment of these exhibitors is in the west of France, whence the material is obtained.

A head-stone of Aberdeen granite, manufactured by Mr. I. **WRIGHT** (43, p. 766), is a beautiful specimen of material, admirably worked, and is worthy of special notice, as designed in good taste, well executed, and well adapted for its object. The Jury make Honourable Mention of this object, considering it as highly creditable to the manufacturer.

The bust and pedestal of blue Peterhead granite, worked and exhibited by Mr. **JOHN HUTCHISON**, of Monyray, near Peterhead (Class I., 161, p. 137), is also a creditable and interesting specimen of its kind. Its object is chiefly to show the adaptability of a stone of excellent quality and great hardness to purposes of art exposed in the open air in cities, and the Jury consider it worthy of Honourable Mention, especially as they learn that it has been very rapidly executed, under circumstances of some difficulty, by a young man who had not before attempted anything of the kind. The cost of granite statues has been stated by Mr. C. H. **SMITH**\* as nearly the same as that of bronze, and their durability, when exposed to the smoke and acid vapours of a town, is very much greater.

The slab of granite from Craignair, near Dalbeattie, exhibited by the proprietor, **WELLWOOD MAXWELL, Esq.** (Class I., 134, p. 135), is from a well-known quarry of excellent material, adapted for ornamental architecture. The composition is a grey quartz, with white or flesh-coloured felspar, and greenish hornblende, often in bands: it is therefore a Syenite. Another manufactured object is of a kind of trap rock found near Edinburgh, which may here be referred to as useful for various purposes, and extremely durable, if not very ornamental. The stone alluded to is not unlike that worked by Messrs. **POILLEY** (France, 962), and is called "Barton Mount Granite." It is exhibited by Mr. G. **JOHNSTONE**, of Craigleith (Class I., 175, p. 138). The girling-stones, made of greenstone trap, and sent by Mr. A. **CASSELLS** (Class I., 26, p. 123), and Mr. J. **KAY** (Class I., 27, p. 123), are also interesting from the great toughness of the rock of which they are made—a quality greatly required for the use to which they are put in the national game from which the name of *curling-stone* is derived. The material is felspathic, with small grains of quartz and minute particles of hornblende. Lastly, we may mention the ornamental works in Scotch granite, chiefly of jewellery, exhibited by Mr. **JAMIESON** (Class I., 25, p. 123), and Messrs. **ELLIS and SON** (Class XXIII., 12, p. 674), and remarkable for the delicacy and beauty with which they are finished. These will doubtless be noticed elsewhere, so far as they claim admiration for taste and execution. We only refer to them here as showing good samples of manufacture of the fine-grained granitic rocks found in some parts of Scotland.

*c. Works in Caen Stone.*

The stone obtained from the quarries of **Allemagne** and others near Caen, in Normandy, has been used in ecclesiastical architecture for so many centuries, that it would be useless to trace back its history for the purposes of this Report. The rock is an oolite belonging to about the same geological period as our own oolites worked near Bath; but the colour is better and more uniform, the texture far closer, and the material superior in almost every respect. It is at first absorbent, but improves on exposure. It cuts with perfect facility, and is

\* Institute of British Architects, Report of Meeting of 24th March, 1851.

thus admirably adapted for ornamental work in architecture, especially when sheltered from the weather. It may be had in blocks of any reasonable size and proportions, and is the finest and most valuable stone of its kind obtained from the secondary rocks. For certain kinds of exposure it is inferior to some of the English oolitic stones, but none excels it for internal work.

So readily worked and beautiful a material has naturally been selected by several persons to execute objects in sculptured stone worthy of the Great Exhibition; but it is, perhaps, somewhat remarkable that none of these come from France, where the material is so abundant. Of the exhibitors in this stone, the Jury have selected three as worthy of the Prize Medal, and one they Mention Honourably. We may proceed to describe these more minutely.

Mr. MYERS (Class XXVI., 533, p. 761) exhibits a number of objects sculptured in Caen stone, most of which are placed in what is called the Mediæval Court. These are imitative of English mediæval architectural decoration, and are chiefly, though not entirely, ecclesiastical in their uses. The execution of the stone-work is in all of them extremely good; the different objects are perfectly correct in execution, and the distribution of the details is effectually and well combined with unity of design, showing clearly the artist's knowledge of his subject and of art. A Prize Medal has been awarded to this exhibitor.

The caupied niche, containing a figure of St. Peter, designed and executed by Messrs. LANE and LEWIS, of Bristol (53, p. 767), is good both in style and execution, and so creditable in every respect, that the Jury felt no difficulty in awarding a Prize Medal to these exhibitors. The stone is of fine quality, and the treatment well adapted to the material. The statue of St. Peter especially is delicately and skilfully worked, and the smaller figures of our Saviour and the Evangelists are well executed. At the same time it should be observed, that the drapery and pose of the figures are not strictly Gothic, although in good keeping with the architecture, which is distinctly defined and well finished, especially in the ornamental parts. The work is not cut out of a single block, which could have been done, although with difficulty, and in this respect it cannot rank so highly as a work in one piece of stone would do.

The font by Messrs. MARGETTS and EVLES (91, p. 771), also rewarded with a Prize Medal, is a very fine specimen of sculptured stone, although there is a want of freedom and finish observable in some parts. The general style and execution is, however, excellent, and some of the details of the figures are very beautiful.

A sepulchral monument of the decorative period, by Mr. R. BROWN (52, p. 767), has been considered worthy of Honourable Mention. It is well conceived and well executed, and is creditable both in design and workmanship.

A cross of large size, sculptured in Caen stone by the Hon. Mrs. ROSS, and exhibited in the West Nave (79, p. 852), is worthy of notice as being the work not only of an amateur, but of a lady.

In addition to these objects, there is a chimney-piece by Mr. FRAWER, of Ipswich (5, p. 764), showing much skill, and having a number of minute but imperfectly finished details. The design is allegorical, but not carried out completely. A singular monument of new form (that of a three-sided prism) has been sent by Mr. BAKER, of Southampton (54, p. 767); and some small but creditable models, by Mr. LAURIE, complete the list of sculptured works in Caen stone. The quality of the stone is shown in some specimens in Class I. (No. 176, p. 772), exhibited by Messrs. LUCAS, BREDDHAM, and Co. (p. 138), importers; and these are of considerable interest and value, as, in addition to recently cut surfaces, they include fragments which have been exposed for several centuries to the weather both in England and France.

#### d. Works in Bath Stone.

The works in Bath oolite are neither numerous nor important. The material itself, although much used, is not capable of resisting the action of an English, and

especially a London atmosphere; so that few artists have thought it worth while to exert their talents on a stone of so little durability. The substance is sometimes of good colour, works freely, and is obtained in considerable blocks; but it falls far short of Caen stone in every respect. A vase and pedestal, elaborately carved and exhibited by Mr. VAUGHAN (20, p. 765), show the extent to which the chisel may be used in it; and a bust of Milton, by Mr. NEWMAN (60, p. 767), is a good sample of the whiter kinds, not ill adapted for internal architectural decoration. Mr. PLOWS (34, p. 769) has sent a number of small articles manufactured of the same substance.

#### e. Sundry Works in Freestone.

Purbeck stone and Purbeck marble, materials susceptible of polish, and formerly much used in ecclesiastical architecture, are exhibited in a sculptured form by only one person, Mr. WYBBER (Class XXX., 149, p. 830), who has sent a design for a tomb made of this stone, placed on a slab of the marble. The material is well adapted to church purposes when new, and retaining its polish; but that being soon lost, the surface becomes discoloured, and loses nearly all its former beauty. It is not much used at present, except for restorations.

The magnesian limestone, till lately seldom used in the vicinity of London, is a stone of great beauty and value, and remarkable for its durability, at least in those parts of the country in which it is found. The best quarries appear to be those near Bolsover, in Derbyshire; and the stone has been selected from that neighbourhood for the construction of the external work of the Houses of Parliament. A specimen showing its qualities has been forwarded by the contractor, Mr. GRISSELL, and is exhibited in Class I. (185, p. 139). Honourable Mention is made of this work, as good of its kind, and well illustrating the use of the stone.

A specimen of freestone is exhibited by Mr. T. KING, of Morpeth (Class I., 136, p. 135), to show the quality of this material from Hartford Bridge, Northumberland, and the nature of the work of which it is capable. This has also been considered worthy of Honourable Mention, as a well-executed illustration of the use of a valuable material.

A very interesting exemplification of the quality and decorative use of Craigleith stone is exhibited by the proprietor, Mr. JAMES GOWANS, of Edinburgh (Class I., 132, p. 135). The stone is much used for building purposes in Edinburgh, and the Redhall Quarry, from which the larger blocks were taken, is of excellent quality. It belongs to the carboniferous system, and is generally of lightish grey colour, fine grained, and almost wholly composed of pure siliceous. It is rather costly at first, but very durable, and may be worked perfectly for every architectural purpose. It contains a small percentage of bitumen.

The objects exhibited are two: one is a group of two children (the Orphans), and a plinth of Hinnystone, which is remarkable for the large quantity of bitumen it contains; the other is a heroic statue of Sir William Wallace. Both are works of merit, and are especially valuable as demonstrating the capability of a stone hitherto not used in England for the execution of such works; and the Jury have awarded a Prize Medal as a mark of their appreciation of the exhibitor's efforts to introduce a material nearly indestructible, and for so admirably illustrating its use.

In Class XXVII. there is a chimney-piece constructed of a stone obtained from Cornwall, and known as the polyphant freestone. The material is hard, and is said to admit of a good polish, although this and another specimen exhibited are both varnished. The style of the chimney-piece is peculiar. The exhibitor is Mr. BRENDON (3, p. 764).

A Prize Medal has been adjudged to M. DESAUVRES (France, 1184, p. 1234), for two objects constructed in

\* This bitumen is obtained in quantities so considerable that it has been used in the manufacture of candles, of which specimens are exhibited in Class I.

Tonnerre stone, of which there appear to be distinct varieties, and of which the specimens sent are of fair appearance and good quality (obtained near the town of Tonnerre, Department of the Yonne, Central France). One of these objects is a pavement, and the other a chimney-piece, the latter showing much labour of execution, and a complicated but poor design. In the architrave there is inserted a small tablet, in cement, representing the zodiac. At the top of the architrave, and at the corners, are groups of animals laboriously carved. At one side is a tall figure in relief. The whole is somewhat in the style of the sixteenth century. The stone in this composition is hard, and the colour not unpleasing, and it seems well adapted for some purposes of internal decoration.

Mr. JOOSTENS, of Belgium (457, p. 1165), has exhibited a pinnacle made of Ordain stone, which the Jury consider worthy of Honourable Mention, as well for the nature of the material, which is hard, even-grained, and well selected, as for the execution, which is neat and well finished: the design is good and pure.

Several artists have sent vases and other objects sculptured in the soft stone of Malta, a material offering great facilities for working, but not remarkable for beauty of appearance, having a peculiar dead-white colour resembling plaster of Paris. The delicacy of workmanship in these sculptures is very surprising, and, in some cases, also, there is much ingenuity shown, and much talent in designing. The Jury have awarded Prize Medals to Mr. DIMICHALE (27, p. 945) and Mr. F. TESTA (33, p. 946); and consider that the works of Messrs. DIMICH (28, p. 945), S. TESTA (30, p. 946), and SOLER (29, p. 945), are worthy of Honourable Mention. There are also some similar objects sent by Mr. FOSTER, an English exhibitor (Class XXX., 303, p. 840). The stone, of which these vases, &c., are carved, is a yellowish-white calcareous freestone, from forty to fifty feet thick, belonging to the tertiary period, and immediately overlying a semi-crystalline limestone, forming the base of the deposits in Malta and the neighbouring island. Very large quantities of the softer freestone are used in the island for building and other purposes, and are exported to all parts of the Mediterranean.

From Tuscan (97, p. 1293) a few articles are sent, sculptured in a kind of lithographic stone, found near Florence, and exhibited by Mr. S. GIOVANNINI, the proprietor of the quarry. The material is fine-grained.

Several models of temples and other edifices are sent from India, constructed of a peculiarly tough but not very hard stone, of which there appear to be different varieties. A few of these are extremely well carved, and show great neatness and finish in execution. Some of them have been coloured artificially. There are also two small latticed windows of delicate open stone-work, showing remarkable skill in cutting stone, besides extreme elegance of design. The material is of pleasing colour and appearance, and is, in these respects, superior to the Gya stone, which is of grey colour, and of which there are several manufactured objects, chiefly small idols.

In concluding this account of the articles in sculptured stone, the Jury make Honourable Mention of a somewhat remarkable pair of vases, cut with a penknife out of sandstone from the neighbourhood of Jerusalem; and the work of an Israelite living in that city. These vases, executed by Mr. SCHNITZER, and exhibited by Sir Moses B. MONTFIERRE (Class XXX., 161, p. 830), show much ingenuity and patient labour. The material is worthy of notice, as a rare instance of stone of the kind being capable of such treatment.

#### C. MANUFACTURES IN SLATE.

The collection of split, sawn, and other manufactured slates exhibited by Mr. THOMAS STIRLING, jun., of the Belvidere Road, Lambeth (Class I., 209, p. 141), exhibits such care in collection and arrangement, and so much novelty of application, excellence of material, variety, and usefulness, as to claim a Prize Medal. Almost all the really important uses to which slate is applied may here be seen; and many new arrangements are shown, some of which at least will be generally

adopted. Mr. Stirling exhibits a construction, consisting of an open cabinet of five sides, made entirely of large slate slabs from different quarries and districts, and illustrating the use of slate in the construction of strong-rooms, powder-magazines, &c. On the top of this cabinet is a cistern, composed of slabs of slate, secured in panels by a method discovered by the exhibitor, and admitting of almost indefinite extension. The exhibitor has selected roofing-slates and slabs of the best quality, from the principal quarries in the United Kingdom, as illustrations of the material and of the qualities of slate prepared for the London market. These either compose the cabinet, or are exhibited within or near it.\*

Besides the application of slates and slate slabs in the ordinary way, and as already mentioned, Mr. Stirling exhibits illustrations or specimens, showing its use for steps, balconies, larders, wine-cellars, dairies, skirting, linings for damp walls, wine-coolers, bread, pickling, and pig-feeding troughs, urinals, head and foot-stones for graves, tombs, and monuments, clocks and sundials, sinks (cut out of a solid block), floors of conservatories, warehouse-floors, railway-station paving, stables, and many other purposes.

To these various miscellaneous articles there is added a set of models of roofs, covered with different descriptions of roofing-slate, in ten different colours. One of these roofs is covered with slab-slates, with a solid slate roll to cover the joint, as arranged and proposed by the exhibitor. The slate recommended for such purposes is that from Cornwall, as it costs less for repairs than the Welsh, and the colour more nearly resembles that of lead.

In addition to these interesting and useful specimens of manufactured slate, there are exhibited several objects in enamelled and varnished slate, now coming into use for various decorative purposes, which will be noticed elsewhere. Some specimens of filters are shown, and many applications of slate, to which it is not necessary here to allude. To these is added a model of a new machine for splitting and cutting slate, evincing considerable ingenuity.

To BEWICK BLACKBURN, Esq. (21, p. 765), of the island of Valentia, County Kerry, Ireland, the Jury have also awarded a Prize Medal, for his manufactures in Valentia slate, and for the excellence of the material exhibited. The slate from the south-west of Ireland, and especially from the Island of Valentia, is not so capable of being split into fine roofing material as that of Killaloe, County Clare; but its remarkable strength, and the evenness of its texture, render it extremely useful for various purposes, both in building and for flags.

Slabs of Valentia slate are easily obtainable 30 feet long, four or five feet wide, and from six to twelve inches thick; and the quality, as seen by the specimens sent by the exhibitor, is, in every respect, excellent. The slabs, sash-bars, and roof-ridges are all good examples of the quality of the material, and the garden-seat and table are excellent, both in themselves, and for the uses for which they are intended. The quarries of Valentia have employed as many as 300 persons at a time.

The OLD DELABOLE SLATE COMPANY (Outside, 8, p. 114) have exhibited, besides some unmanufactured slates, a very large and well-constructed cistern of Delabole slate, capable of containing 2,000 gallons, and provided with a filter. The Jury consider that this deserves Honourable Mention, as a fit and useful application of a material of good quality at a moderate cost.

Several exhibitors have sent slate cisterns, furnished with filters, the mechanical arrangements of which belong to another Class. As far as relates to the material, and its application, the Jury consider that slate is ad-

\* The slates are from the following localities:—Penryn quarries, near Bangor; Llanberis quarries; quarries of the Dorothea Slate Company, near Caernarvon; various quarries at Festinog and Machynlleth, all these being in North Wales; and from the Delabole quarries in Cornwall, and various quarries at Conistone, in Lancashire; and Langdale, in Westmoreland.

mirably adapted for such purposes. The exhibitors of such filters are, besides those already mentioned, Mr. T. STIRLING, sen. (120, p. 773), Mr. STRUTHERS (Outside, 16, p. 114), and Mr. C. HUNT (109, p. 776).

A peculiar application of slate in the manufacture of coffins for vaults is illustrated by a model exhibited by Mr. J. EKINS (13, p. 764). The material is, perhaps, better adapted for such purposes than lead, and the cost may be less; but such means of preserving the human body in a state of partial decomposition are of questionable value.

An inkstand, of very beautiful Penrhyn slate (Class XXVII., 63, p. 767), manufactured by I. ROWLANDS, of Llandegai, near Bangor, is an ingenious and very carefully worked illustration of what can be done with this material. The Jury make Honourable Mention of it, as an encouragement to this kind of industry, and the endeavour to make an useful and ornamental object of the only material which the exhibitor had before him.

The school-slates of Messrs. DAWBARN and Co. (Class I., 208, p. 141) are of large size and good quality; and the same may be said of the slate ridges and rolls exhibited by Mr. D. WILLIAMS (Class I., 215, p. 142). The application in both cases is correct, and the manufacture important.

The model exhibited by Mr. J. GEORGE (Class I., 213, p. 142) is intended to show the applicability of slate in conjunction with iron to constructive purposes.

Three Companies exhibit collections of French slates, all of which include split and dressed slates and slabs. The Jury consider the slabs from Angers, exhibited by the Agent of the Angers Slate Works, M. LARIVIERE (290, p. 1190), as worthy of Honourable Mention. The others are from the Joint-Stock Company of the Slate Works of Rimogne (Ardennes), A. MOREAUX, Agent (378, p. 1195); and the SLATE WORKS COMPANY of Rimogne and St. Louis (694, p. 1212). The slates, especially those from Angers, are of large size and fine quality, and are well dressed and manufactured. Messrs. FOSTON, DUPONCEAU, and Co. (France, 1228, p. 1236), of Châtenou (Mayenne), exhibit a slate billiard-table, considered worthy of Honourable Mention. In the manufacture of billiard-tables slate is now rapidly superseding all other material.

Some slates of good quality are exhibited by Mr. S. SOLESI, of Chiavari, Sardinia (2, p. 1302). These include not only roofing-slates, but a table and polished writing-slate. They are fairly worked.

#### D. MANUFACTURES IN VARIOUS KINDS OF STONE AND OTHER MINERALS.

Under this head are several miscellaneous articles, such as steatite, or soap-stone, coal and jet, tuff, &c., not very easily included under other headings. Though unimportant, they possess some interest. The steatite especially, although at present little used in this country; is well worthy of attention, as possessing valuable properties, and capable of being supplied from America and elsewhere in blocks of large size. The articles manufactured of coal are more curious than useful; but those of jet are not without value in a commercial sense.\*

THE MARYLAND SOAP-STONE COMPANY (United States, 180, p. 1449) has received Honourable Mention for articles manufactured in the steatite abundantly found near Baltimore, and exhibited by the Company. This stone, hitherto little used for economic purposes, may be obtained, without flaw, in large blocks, adapted for many useful purposes, those especially instanced by the exhibitors being baths and sizing-rollers used in cotton mills. For the latter purpose it possesses the great advantage of not being affected by the acids ordinarily used in sizing, and of not warping, contracting, or expanding by changes of temperature and moisture. It is also recommended as an admirable material for fire-stone, kitchen-sinks, wash-tubs, bath-tubs, urinals, &c. It is readily wrought, being bored, turned, and planed by the ordinary tools of the carpenter, and it may be screwed together with nearly the facility of hard wood.

The wholesale prices of blocks of steatite, delivered on board at Baltimore, are as follows:—

Sawn or chiselled blocks, per cube foot, 1 dollar (4s. 3d.)

Slabs, per square foot super. 1 inch thick, 25 cents. (1s. 1d.)

Slabs, per square foot super. 1½ inch thick, 28 cents., and more in proportion to thickness.

The manufactured articles would be supplied at corresponding prices, but it is considered that if the blocks cannot be admitted duty free, as raw material, it would be necessary to charge double the price quoted for selected blocks tested for special purposes.

This steatite is a silicate of magnesia, and the form of it here exhibited is compact, of greyish colour, soft to the touch, of specific gravity 2.65 to 2.8, hardly affected by sulphuric or muriatic acids, and little altered by exposure to intense heat. Other objects of steatite are exhibited from India, where the material appears to be abundant, and where it has long been used for household utensils.

A couple of vases manufactured of the tuffa, obtained from the hot-water springs of Carlsbad, are considered by the Jury worthy of mention, for the nature of the material. The vases themselves offer nothing remarkable. They are exhibited by Mr. GÖTTL (Austria, 724, p. 1048).

Several persons have exhibited articles manufactured of cannel coal and jet, materials derived originally from the vegetable kingdom, but now existing in a mineral condition. These, although not sufficiently important to require any lengthened description, are interesting, especially the small objects in jet, from their manufacture giving employment to many persons in various parts of Europe.

Cannel coal is chiefly used in the manufacture of gas, but some of the harder and more compact bands are occasionally cut into various ornamental objects, several of which are represented in the Exhibition. The most interesting of these as a finished work, well designed, and well executed, is a garden-seat, exhibited by His Royal Highness PRINCE ALBERT (140, p. 777), manufactured by Mr. T. W. WAUN, from the design of L. GRUNER, Esq. This is made from a fine kind of cannel, called 'Parrot-coal,' obtained in the Fifeshire coal-field, on the estate of Admiral Wemyss. The Jury consider that both for design and execution this object is worthy of Honourable Mention.

A well-constructed model of the Durham monument (Class I., 269, p. 146), and a wine-cooler (907 p. 771), both made of cannel-coal, are exhibited by Mr. G. H. RAMSAY. This coal is obtained from a part of the Newcastle coal-field, and is a kind largely used for gas-making in London. Being compact and brilliant, and not soiling the fingers, it is well adapted for working into ornaments.

A number of small articles are exhibited by the INCE HALL COAL COMPANY (Class I., 268, p. 146), manufactured of their cannel, which is little inferior to that of Newcastle, and is obtained from a part of the Wigan (Lancashire) coal-field. A collection of yet smaller objects is shown by Mr. MITCHELL (Class I., 270, p. 146), illustrating the uses to which a hard variety of the same substance from the vicinity of Edinburgh may be applied. A set of chess-men, manufactured of coal and alabaster, is exhibited by Mr. C. VOKENS (30, p. 765), as another illustration of a similar kind, and a snuff-box in coal is described amongst the goods from China.

Jet is a material chiefly used for ornamental purposes. It is hard, little, opaque, scarcely heavier than water, and takes a very high and beautiful polish. It is found in various parts of Europe, America, and Asia Minor. In Roman Catholic countries, a large quantity of small ornaments (as crosses, beads, rosaries, &c.) is made of this material, and it is extensively used withal for mourning decorations.

The principal exhibitors of jet are Messrs. SLATER and WRIGHT, of Whitby (Classes I., 2, and VIII., 312, p. 121), where the raw material is obtained in abundance and in very good condition. Their articles belong to the class of jewellery. Another exhibitor of

\* From an analysis forwarded to the Reporter by the exhibitor of these articles it appears that this variety of cannel yields as much as 15,000 cubic feet of gas per ton.

English jet if Mr. GREENBURY (Class XXIII., 8, p. 678). The jet of the Asturias, which has long been known in Spain, is represented by some specimens forwarded by the town authorities of Oviedo (Spain, 33, p. 1331). These articles are sold at an extremely low price on the spot.

The Jury might here refer to amber, as being a mineral production; but the articles exhibited partake so closely of the nature of jewellery, that it is considered better to omit noticing the substance and its exhibitors in this Class.

#### Group 2.—POLISHED AND INLAID WORK IN STONE, &c.

Under this head are included all kinds of earthy mineral substances, as stone, marble, alabaster, granite, porphyry, jasper, quartz, jade, agate, and gems used in a polished state either in constructing or inlaying various objects of decoration and use. The working, polishing, and inlaying of several of these are generally in the same hands; but in describing the objects, we propose to treat of the inlaid work as a separate subject. The cutting of jasper, quartz, jade, &c., is a peculiar manufacture, when performed on a large scale.

The total number of exhibitors in this group is about 126, of which those from the United Kingdom amount to something less than one-half. Tuscany and France take the next place in point of number and variety, but the most attractive objects are from the former country, consisting of mosaics or inlaid work, those from the latter being principally chimney-pieces. Austria has four exhibitors, three of them Italian, and the objects exhibited are chimney-pieces, strictly Italian in character. Rome has three exhibitors, one of them extremely remarkable for the beauty of the workmanship shown. Italy is thus strongly represented, a fact which might have been anticipated from the habits and history of the people. Russia has long been celebrated for work in mineral manufactures, and the exhibitors from that country have not failed to take this opportunity of showing the progress that has been made of late years in the processes of polishing and inlaying, especially with regard to Florentine mosaic and veneering in malachite. From Germany there are several exhibitors, but the progress there made in the art of decorative work in marble and mosaic does not appear to be well represented in the Exhibition, although there is one very creditable exception, showing that the polishing of granite is thoroughly understood in Berlin. Belgium exhibits a few, but very few, objects of interest. The countries of the Peninsula are contented with sending their marbles rather as specimens of material than workmanship. It remains only to speak of Sweden and Norway among European countries, but these are extremely remarkable, and present good proof of a thorough knowledge of the art of granite-working in its best applications.

From the south coast of the Mediterranean we have a few fine slabs exhibited from Egypt, though chiefly as raw material, and one inlaid table from Tunis, interesting for the marbles, and also illustrating a manufacture. India and China, especially the former, are much more remarkable, and show a degree of skill and taste in the most difficult and important decorative work in stone and *pietre dure* that puts to shame all that is done in Europe, and shows how much yet remains to be learnt from a country which has so long been the seat of a certain kind of civilisation.

America presents a few objects, which will be found noticed in the proper place.

#### II. MANUFACTURES IN MARBLE AND ALABASTER.

Manufactures of this kind partake of that higher art which is recognised as sculpture, but there is so much of a purely mechanical nature, and so much more in which a certain degree of taste in execution redeems the character of questionable models, that in every country there has been from time to time a characteristic style, and a distinct manufacture in marble, the history of which would be valuable and interesting.

Italy is pre-eminently the country where this manufacture has been found most congenial to the artistic feel-

ing of the mass of the people, and there, or in its vicinity, at the present day, a large part of the best marbles used in Central Europe are obtained and worked. Of late years, however, France, Spain, Portugal, and parts of Germany and Belgium, have employed for their own use, and in their own style, many useful and valuable marbles with which they abound; and in England manufactures have arisen, at first and chiefly in Derbyshire, but also in Devonshire and Cornwall, in which much has been done to raise the character of marble decoration, by employing the excellent material which abounds in those places, and by introducing various useful objects of house decoration at a price which, though somewhat too high for the mass of consumers, is far below that of foreign goods of the same kind in this country. Ireland also, in which several fine marbles occur, has given proof of some activity in this manufacture, for which, indeed, nature has offered many facilities.

There are some marbles from Greece, and also from Italy and the coast of Asia Minor, which were greatly admired and used by the ancients, but of which the quarries are now exhausted or concealed by rubbish. Amongst them are the true Parian of Greek sculptors, and some other fine white marbles; the *nero antico*, now a very rare black marble, considered purer and better than the known kinds; the *rosso antico*, a deep blood-red marble, with veins and spots; the *verde antico*, a green and very beautiful porphyritic breccia; the *giallo antico*, not unlike the modern Sienna marble, of very rich yellow tint; with some others. Most of these are only known in sculptured specimens, but many, if not all the colours, are closely approximated by recent marbles.

Marble is cut with a thin plate of soft iron used as a saw, and supplied continually with water and sharp sand. Both the hand and machine power are used, and the cutting is carried on continuously in most marble-works. The polishing is commenced by rubbing down the surface with sharp sand till it is perfectly flat. Finer sand is then gradually used, and at length emery, after which tripoli, the last polish being given with tin-putty. The coarse sand is usually rubbed on the marble with a plate of iron. The polishing rubbers are coarse linen cloth. Water is required in every stage.\*

\* The Reporter is indebted to Messrs. Hall, of Derby, for the following account of the mode of turning and polishing marble, spar, and alabaster, as practised by them:—

Having chosen a piece of marble about the size required and free from veins, vents, &c., to which black marble is very subject, the first process is to level one face, and with a pair of compasses strike a circle round the outer edge, then with a mallet and pointed chisel work it roughly to a circular form. It is then ready for the lathe, and being fastened with a resinous cement to an iron chuck, it is screwed to the lathe-spindle, and a very slow motion given to it. The only tool used is a bar of fine steel about 30 inches long by  $\frac{1}{2}$  in. square, drawn to a point, and well tempered. This is forcibly applied to the marble, which it reduces to the proper form by slowly speeling off small pieces. After the correct outline is acquired with this tool, it is ready for the grinding process, the first being to apply a piece of coarse and hard sandstone with water (the lathe now having a rapid motion) until all the tool marks are ground out. A finer piece of sandstone is then used to remove the coarse scratches of the previous one, and so on with a few other and still finer stones, until all the scratches are quite obliterated. This prepares it for polishing. A piece of cotton cloth, washed quite clean, and well rubbed with flour emery, is applied to the marble, and polishes it to a certain extent. A similar piece of cloth is then rubbed over with putty powder (white oxide of tin), which gives a very high polish.

This is the method, with a few trifling variations, by which all kinds of marble are turned and polished.

Finer spar undergoes nearly the same process, but requires much greater care and skill on the part of the workman, as the spar, being composed of a mass of crystals, whose cleavage is in various directions, requires a more delicate manipulation than almost any other stone.

Alabaster is a soft stone, and can be sawn with a common tooth-saw, and is turned and polished in a very similar manner to marble.

The chief marble manufacture of England is in a part of Derbyshire, remarkable for its picturesque beauty, extending along the valley of the Derwent and its principal tributary the Wye, from below Baxton to Derby. The machinery for sawing and polishing was first established in Derbyshire, at the village of Ashford, near Bakewell, in the year 1748, water being the motive power. About the year 1810, similar machinery was erected at Bakewell. Both these works are situated near the quarries. Within a few years other works have been established at Buckland Hollow, near the line of the Midland Railway. These works give employment to upwards of seventy persons: about one-fifth work in the quarries: the rest are marble masons, polishers, &c., employed in part upon foreign marbles. Besides these three works, others have been established in Derby for many years.

The most important marbles of Derbyshire are the black, the rosewood, the encrinital, the russet, or bird-eye, and a mottled dark and light-gray kind, occasionally containing numerous small corals. Of some of these there are several varieties. Others might be added to the list of those found in the northern part of the country, one of which is a beautiful red, resembling the *rosso antico*, but it is obtained only in small blocks or lumps.

At Wetton, in Staffordshire, near the borders of Derbyshire, are marbles differing much from the above, but they have not been brought into any considerable use, and are generally subject to flaws.

The black marble is of very fine colour and texture, but large slabs free from small veins of calcareous spar are rare. The best quality occurs in beds of from 3 to 8 inches in thickness; some beds are thicker. This marble is, perhaps, superior to the similar kinds found in other parts of Europe, and is greatly valued for inlaying. It is tough, and contains a good deal of carbon, which imparts the colour. Within a very recent period the finer slabs have been inquired for, for exportation to Florence, Malta, and St. Petersburg, besides being used in Devonshire and Derbyshire.

Black marble is extensively used for ornamental objects, such as vases, pedestals, chimney-pieces, &c., for which it is admirably adapted. It is occasionally ornamented in various ways, as by etching, engraving, and inlaying. In the two former processes the polished surface is removed, and the brown colour of the rough marble exposed. Powdered white-lead is sometimes rubbed into the etched surface to increase the effect. By a peculiar process used at Derby, the brown colour is sometimes exposed without the polish of the marble being destroyed. The ornament produced by this process is more durable than the ordinary etching.

The rosewood marble is extremely hard, and of close texture. The beds are of considerable thickness; but the most beautiful part of the marble is only about 6 inches thick. The name is derived from the marking of the marble being somewhat similar to that of rosewood.

The encrinital marble is the one in most extensive use, and contains very numerous fossils, consisting almost exclusively of the broken fragments of encrinital stems often entangled in coral. It may be obtained in blocks of large superficies, and of a thickness of 2 to 2½ feet.

The russet, or bird-eye, takes its name from its colour and appearance, the shades varying from light gray to brown. It contains numerous minute fossils, also encrinital, and is found in beds of from 6 to 18 inches in thickness.

The dark and light mottled gray marble (called Newburgh marble), and the overlying bed, which is coralline, can be obtained from 1 to 2 feet thick.

The manufacture of Devonshire marble is much more modern, and the material is generally less manageable. Almost all the beautiful marbles of this county, especially those near Plymouth, are fossiliferous, brittle, and very apt to contain veins and cracks. They are illustrated by some beautiful and interesting specimens, which will be

The columns formed of pieces of black marble and alabaster (exhibited in Class I., No. 146, by J. and G. Hall) show the various processes, beginning with the rough stone at the bottom, and ending with the final polish at the top.

alluded to as the works of individual exhibitors. The marbles of Devonshire belong to an older geological period than those of Derbyshire, the latter being exclusively of the carboniferous limestone series, underlying the coal measures and the millstone grit, while the former are of the Devonian, or middle Palæozoic epoch.

The other kinds of marble, obtained from various localities, do not appear to involve any peculiar method of manufacture, nor is it necessary to give further details on this subject. It may well be supposed that the cutting and polishing of alabaster, a material much softer than marble, is in a corresponding degree easier. It is said that soap is used in polishing alabaster, and some of the objects constructed of this material are rendered translucent by being soaked in some kind of oil. The chief locality of this manufacture has long been in the north of Italy, near Leghorn, where the material is very abundant. A considerable number of alabaster ornaments are now made in Derbyshire, chiefly from Italian models: those originated on the spot are not yet remarkable for excellence of design. The material is obtained in that country in considerable quantities.

In proceeding to mention the different exhibitors in these materials, we may begin with an account of the series of manufactured marbles sent from various places.

#### a. General Collections of Marbles.

There are several collections of marbles exhibited from foreign countries, in which the specimens are at least partly manufactured, and some even finished, although the general intention in such cases seems to have been to exhibit them rather as raw materials than as specimens of manufacture. Many of them thus belong to Class I. (Raw Materials of the Mineral Kingdom); but others partake so distinctly of the character of the objects in Class XXVII., and so clearly involve processes of manufacture, that the Jury of this latter Class have thought it necessary to allude, however briefly, to them. To some of these they have voted Medals.

The collection of Italian marbles forwarded by the ROYAL TECHNOLOGICAL INSTITUTES of TUSCANY (Tuscany, Nos. 1 and 98, p. 1290) is of very considerable interest, and includes many varieties little known in this country, some of them remarkable for their beauty and excellence. The Jury mark their sense of the value of this series by awarding a Prize Medal to the Institution by which it has been sent.

To M. DÉJEANT (Portugal, 232 to 247, 250, 251, 259 to 274, p. 1310) a Prize Medal has been awarded, for a most interesting series of Portuguese marbles, of great variety, and including many of considerable beauty. A fine collection of Pyrenean marbles is sent by Messrs DERVILLÉ and CO (France, 162, p. 1181), to whom also a Prize Medal is awarded (Prize Medal given by Class I. also); and an almost equally interesting series of specimens from Languedoc is contributed by M. CAFFORT (France, 444, p. 1199), of whom Honourable Mention is made. M. COLIN (France, 1864, p. 1251), who has exhibited a series of polished marbles, granites, and serpentine from the Vosges mountains, is also Honourably Mentioned.

The GREEK GOVERNMENT (Greece, 26-49, pp. 1404-05) has sent samples from some of those quarries whose reputation dates as far back as history can record, but they are not in a condition of manufacture to justify extended notice here. The marbles are decidedly inferior in quality to some of those obtained more recently in greater abundance from nearer localities, but if the quarries were properly and extensively worked, far better material might probably be obtained.

The EGYPTIAN GOVERNMENT (Egypt, 1-4, p. 1408) has been induced to open, of late years, the rich stores of oriental alabaster, a material celebrated in antiquity, and of which is made one of the most interesting works in mineral manufactures in the Great Exhibition.\* The condition of this marble is very peculiar, but it would seem that considerable quantities of excellent quality might readily be obtained. It is a peculiar condition of lime-

\* The object alluded to is the Tazza, by Mr. Dallamoda (Rome, 19).

stone (a true carbonate of lime), apparently formed in the manner of stiblagmite, and on account of its peculiar tint and translucency was called by the ancients alabaster.

From India are sent many specimens partly manufactured, indicating the existence, in that country, of valuable material more or less resembling our marbles, and suitable for similar purposes. A few of these are coloured, and the quality of the white marble is very peculiar. One of the coloured kind may be mentioned as affording a tint of pale green, unknown in Europe. This is from Bellary (Madras, p. 868), and is a magnesian rock, probably a variety of serpentine. Many of the harder materials might also be mentioned.

A small series of partly manufactured jades recently forwarded from China, by Dr. BOWRING, is interesting on account of the material, which is, however, too difficult and costly in working to be much used for economic purposes, unless indeed mortars and pestles and some other objects for chemists could be manufactured of it of larger size than can now be made of agate, and at moderate cost.

Many collections of marbles and other substances referred to this Class are not noticed here, because they are less decidedly manufactured. Taken as a whole, it cannot be said that these collections are in any sense complete; but they may, if afterwards brought together, form a nucleus of much value, which will suggest many useful hints. We proceed now to describe in succession the various manufactured objects which are most easily and readily compared.

#### *b. Chimney-pieces.*

The chimney-pieces sent for exhibition involve so many differences in style and material, and are of so many degrees of merit, that it were unreasonable to judge them all by one standard, or regard them from one point of view. Architectural decoration and sculpture, beauty and excellence of material, adaptability to the special purpose required, cheapness, and many other considerations, must all be taken into account; and the Jury have endeavoured to select for reward from the whole number those most remarkable for each of these qualities.

The works of this kind of the greatest pretension and highest claim to originality are three chimney-pieces of statuary marble (of Carrara), exhibited by GIUSEPPE BOTTINELLI, of Milan (Austria, 726, p. 1043). They are all characterized by elaborate design, and excellence in the details of execution. They also show much freedom and boldness of sculpture, and deserve much praise for the vigour and life with which the numerous figures and various objects are represented. The Jury fully appreciate this high excellence in many points, and adjudge a Prize Medal to the exhibitor; but they would direct attention to the fact that the style of ornament is not adapted to the object, nor are the designs altogether in good taste. On the whole, however, their artistic merit is of a high order: the figures are correctly modelled, and full of life and delicacy; and this effect is produced by the chisel, and is by no means the result of mechanical assistance. The faults of style seem to have arisen from an attempt at great originality, which is but partially successful. It should be remarked, also, that the material is not of the finest quality.

The chimney-piece, by G. MOTELLI (Austria, 728, p. 1044), also of Milan, is marked by the same excellences, and some of the same faults, as those of Bottinelli. The design is generally good; but the countenances, especially of the Cupids, are unpleasant, and a part of the marble is left rough to heighten the effect, which is hardly admissible in a chimney-piece. In other respects the execution is highly creditable to the artist. This, and a marble mantel-piece by G. BENIGNI (Austria, 725, p. 1043), are considered by the Jury as worthy of Honourable Mention, both of them bearing evidence throughout of the taste, judgment, and feeling of an accomplished artist.

Next to the works of these Milanese sculptors, the Jury place the chimney-piece exhibited by A. LACLENGO, of Brussels (Belgium, 488, p. 1164), which is constructed of very beautiful Carrara marble. The architectural

design is of considerable merit, and the details very admirably executed. The general work of the figures and principal features of the design are also commendable; but the purely ornamental part is inferior in composition, sometimes confused, and has little life and delicacy of expression. It is also finished too much with the file and pumice-stone. Notwithstanding these faults, the work, as a whole, has very great merit, and has been recommended as worthy of a Prize Medal.

A very beautiful and carefully-worked specimen of the black marble of Belgium, executed in that country, and fitted to an English stove, is exhibited in Class XXII., (491, p. 650), by I. NORMAIN. It consists of a chimney-piece and large mirror-frame above, without ornament, but of noble proportions. The effect is rather heavy, but the work is so good that the Jury award a Prize Medal to this exhibitor. The material is also excellent.

There are no less than five exhibitors of marble chimney-pieces from France, one of whom exhibits several works of good general character, and in good taste; and another, a group chiefly remarkable for combining a certain degree of excellence with moderate cost. The rest all offer some points of interest, but they are confined to the simpler kinds for house decoration.

The Jury award a Prize Medal to Mr. ÉCOVIN (France, 592, p. 1212), for a carefully finished work in veined Carrara marble, of very ingenious design, and some merit in workmanship. They also give a Prize Medal to Mr. J. A. LEROUX, jun. (France, 572, p. 1205), for three similar objects in white and veined marble, which are stated to be of moderate price, and are well adapted, by their style and comparative simplicity, for the usual purposes of chimney-pieces. The cost of a moderately ornamented chimney-piece by this maker is said not to exceed 12*l.* in Paris.

Three chimney-pieces by Mr. MANGA, of Paris (France, 608, p. 1207), deserve notice, and one of them, of veined Carrara marble, is in good taste and well executed. Of this exhibitor the Jury make Honourable Mention. Mr. J. DUPUIS, also of Paris (France, 184, p. 1183), sends three similar objects, one of which, with a simple geometrical pattern, is in good taste, without any high pretensions. Generally speaking, the French works of this kind exhibit a somewhat over use of the file, and too little of that free handling by the chisel which gives life and expression to a sculpture.

We come lastly to the English chimney-pieces, which are not very remarkable either for design or execution. Excluding those which do not owe their chief excellence to inlaid work, few are left that will detain us long. In the Nave, West (82, p. 756), there is one by Mr. THOMAS, of white marble, with a bust of Shakspeare and various figures, the sculpture of which is tolerable, but the whole is too much like a monument. In the same part (86, p. 847) is a rather elaborate white marble chimney-piece, by Messrs. BAYNE BROTHERS and T. SEAR. The design is not remarkable, but the work is good. The gilt ornament is perhaps more novel than admirable, but the Jury have recommended the exhibitor for Honourable Mention.

In Class XXVII. (17, p. 764) the LONDON MARBLE WORKING COMPANY exhibits a good white marble chimney-piece, for which, and several other objects in marble, a Prize Medal is awarded. Mr. TENNANT and Mr. HALL (37 and 38, p. 766), exhibiting together several Derbyshire and other marbles, of which Honourable Mention is made, have, amongst the rest, a black marble chimney-piece, with stove, and porcelain tiles. Others will be afterwards described amongst the inlaid work.

There are several chimney-pieces in Class XXII., which rather illustrate improvements in stoves than offer anything new or remarkable in marble working. One of them, however, by Messrs. THOS. and JAMES NELSON (102, p. 603), is well executed and handsome, in a stone somewhat difficult to work, and the Jury consider it deserving of Honourable Mention. An alabaster chimney-piece is exhibited by Mr. W. PRINCE (107, pp. 604, 605), but the material is manifestly unsuited for the purpose.

Lastly, there is a veined Carrara marble chimney-piece,

by Messrs. FORSULT and HARPERATH, of Cologne (Prussia, 317, p. 1068), which is mentioned as being the only work of the kind from North Germany. It should be remembered that this kind of house decoration is little needed in countries where close and ornamental stoves take the place of our open fire-places.

On the whole the Jury cannot highly praise the group of objects now under consideration: those of greatest pretension lack simplicity, and the rest are destitute of any originality or elegance which can entitle them to rank above ordinary furniture and house decoration.

#### c. Columns, Pedestals, &c.

It is unnecessary to enumerate here all the exhibitors of columns, pedestals, &c., and only a few will be mentioned, which appear to require notice on account of material. Many of the others may have the same kind of merit of execution, which is, however, too simple to need description.

From Tuscany are several fusts of columns, one of which, sent by C. NOBILI (91, p. 1292), is remarkable for the extreme beauty of the material. It is a brecciated marble, of a remarkable soft brown colour, fine texture, and good polish, and is well adapted for house decoration. It has been selected for Honourable Mention. Other columns from Tuscany, by GUIDOTTI (94, p. 1293) and MAFFEI (95, p. 1293), are not without considerable beauty, but they are not so new. They are for the most part of brecciated marbles.

The Belgian columns exhibited by the Viscount DEMANET DE HESNER (Belgium, 16, p. 1151), and Honourably Mentioned by the Jury, are chiefly interesting as examples of the black marble of the country. The French have contributed few objects of this kind.

Of English columns there are some of considerable interest. Two of large size and great beauty, adapted for church or palatial decoration, are sent by Mr. CHAMPERNOWNE (Main Avenue West, 158, p. 848), from a quarry in Devonshire, capable of yielding much excellent material, in slabs of large size. The marble is of the kind called "madrepore," being almost entirely made up of coral-limestone, greatly altered, but retaining its organic texture. The colour is good and richly varied, but it has the demerit of being cut the wrong way of the grain, and is built up as stone-work although polished as marble. The Jury make Honourable Mention of these columns.

The ROYAL DUBLIN SOCIETY (71, p. 768) has sent bust-pedestals, one of a white marble, and the other of a well-known green colour, both from Connemara. The latter is remarkable for its rich green hue and great beauty; and the selection of material being important in ornamental marble-work. The Jury have made Honourable Mention of the Society for the success attained in the present collection. There are two marked varieties of colour of green Connemara marble, one being much darker than the rest. Mr. FRANKLIN, of Galway (73, p. 768, and Class I., 144), has sent two black marble pedestals, one prepared for polishing and another finished. These show the quality of the material, which is unquestionably good, and both are from his neighbourhood.

Messrs. OLDFIELD and Co. (p. 969), Messrs. LOMAS and Sons (81, p. 969), and some other exhibitors from Derbyshire, have supplied specimens of Derbyshire marbles of various kinds, which well illustrate the character of the stone and its uses. The so-called rosewood marble, which is one of them, has been already described. It is very beautiful, but so much harder than the others, that the saw will cut the encaustic marble of the same district three times as quickly.

Various pedestals of granite and porphyry are exhibited from Cornwall, but these will be elsewhere described.

#### d. Slabs, Table-tops, and Tables.

These objects are chiefly interesting in reference to the material of which they are constructed. Some of the marbles are beautiful, and a few are remarkable for rarity.

The Connemara marble tables exhibited by Mr. LAWRENCE (70, p. 768) consist of two picked slabs from the Ballinahinch quarry, considered to be remarkably fine,

and placed on pedestals of black Galway marble. There are flaws in the slabs, but they are Honourably Mentioned by the Jury as good samples of the material, which is worthy of more extensive use than it has hitherto obtained. The Galway marble is also exhibited by Mr. HUNTEN (Class XXVI., 302, p. 751). Mr. CHAMPERNOWNE (6, p. 784) exhibits a table of Devonshire marble, not very remarkable for beauty of material, but massive, well proportioned and adapted for certain uses. An interesting and rather beautiful slab of the Plymouth limestone, used in the construction of the breakwater, has been formed into a table, and is sent by Mr. STUART (55, p. 767). A magnificent slab of foreign marble is amongst the goods exhibited by the LONDON MARBLE WORKING COMPANY (17, p. 764), and is worthy of notice for its excellent finish.

It is pleasing to observe amongst the goods sent from Canada a table of polished limestone or marble, the material the same as serves for ordinary building purposes in that colony. It is remarkably fine-grained, but the colour is not particularly ornamental. It is exhibited by Mr. HAMMOND (118, p. 965), and is Honourably Mentioned.

A table is exhibited amongst the East Indian productions, the top of which consists of a slice of a column from Nineveh. It deserves attention from the condition of the limestone, though the material takes only an imperfect polish. It is the property of Colonel SYKES (p. 921).

The slabs of marble exhibited by M. GUISLAIN, of Belgium (423, p. 1154), are good specimens of the ordinary material used extensively in that country, not only for ornamental, but for general domestic purposes. It is no doubt owing, partly, to the low cost of the labour required for preparing these slabs, and partly to the great abundance and variety of the material, that marble is so much more used on the Continent than with us; but it is worthy of consideration whether we might not introduce the cheaper kinds for many purposes of furniture, and in so doing, follow the example of our neighbours in France, Belgium, and elsewhere. M. Guislain has been deemed worthy of Honourable Mention.

The Italian marbles used for tables and slabs are sent by several exhibitors. Of these the Count de GUIDO (Tuscany, 93, p. 1293) exhibits two of red colour and excellent quality. The material is little known. The Marquis PANCIATICH (Tuscany, 96, p. 1293) shows a good specimen of "fiammella," or fire-marble, which is a dark-brown shell marble, having brilliant fire-reflections from within. He also has two smaller tables. M. NANNI (Tuscany, 29, p. 1293) has sent a circular table, of the marble called *verde di prato*, and M. GUIDOTTI (Tuscany, 94, p. 1293) three tables, two round and one oblong, the latter of good colour, but not very close texture.

The ROYAL TECHNOLOGICAL INSTITUTE (p. 1290) has also forwarded a number of tables of various kinds of marble, sufficiently described in the Catalogue. To these some reference has already been made in speaking of the Tuscan marbles generally.

There are but few proprietors of those numerous quarries in Germany which furnish the various marbles in common use, who have thought it worth while to forward for exhibition fair samples of their produce. Amongst these is, however, one, the RUHRLAND DUCAL ESTABLISHMENT of BRUNSWICK (Prussia, 780, pp. 1093, 1094), which deserves notice for the beauty of the slabs and the good condition in which they are sent. M. CANTIAN, of Berlin (Prussia, 238, p. 1061), has sent a beautiful slab of Prussian marble, very admirably executed. Of the former exhibitors, Honourable Mention is made for the group of objects they exhibit. The latter is rewarded with a Prize Medal, having sent several articles of considerable interest.

The collection of marbles cut into slabs and table-tops, and sent by M. J. J. FROUENÇO (Portugal, 243, 243, 252 to 257, p. 1310), has been Honourably Mentioned by the Jury. This series is exceedingly remarkable for the beauty and great variety of many of the specimens, and illustrates the riches of Portugal in this respect. Some of the slabs, especially, must be very valuable if not too

brittle for working, which cannot be positively ascertained in their present state. The specimens of M. Dejeant, of Portugal, have been referred to before, in treating of the collections of marbles from various countries.

The EGYPTIAN GOVERNMENT (p. 1408) has sent a number of samples of that extremely beautiful marble known as "Oriental alabaster." This material is not really alabaster (sulphate of lime) in the modern sense of the word, but being of a very delicate colour, great clearness and transparency, and peculiar texture, it resembles that mineral, which has indeed been named from it. The table-tops of this stone are very beautiful, and admirably worked and polished. They have obtained Honourable Mention.

From the United States but few specimens of marble have been sent, but we observe a very beautiful and well-executed table-top of yellow marble, resembling Sienna, sent by Messrs. DOZ, HAZLETON, and Co., of Boston (418, p. 1462).

#### *a. Miscellaneous objects in Marble, &c.*

Miscellaneous objects in marble, alabaster, &c., are numerous. They include some fonts, a bust, a tomb, and various ornaments for the table and drawing-room, from England and Ireland. Numerous small toys and other objects are sent from India, with garden-seats; some vases and other things from Italy, and a few trifles from other countries. We proceed to enumerate them.

The fonts are several in number; some of white statuary marble, one of marble from Devonshire, and others of less pretence. Two of the former, exhibited by the LONDON MARBLE WORKING COMPANY (17, p. 764), are plain, but of elegant design and good execution. The third is by Mr. PRYMAN (Nave, 60, p. 848). The Devonshire marble font, by Mr. BOVEY (p. 764), is a fair specimen of the stone, which is one of the richly variegated coralline marbles of Plymouth; but the material is not adapted to the object, nor is the style good, though the execution as marble work is praiseworthy.

A bust of Grattan, well executed in Irish marble, is very interesting, as proving the existence in Ireland of a highly crystalline, yellowish marble, adapted for the use of the sculptor, and more approaching the ancient Parian than anything known elsewhere in Europe. This marble is from Dunlavy Quarries, county Donegal, and the quality may be expected to improve, if the quarry should be further worked. It is exhibited by the proprietor, Lord MONTEAGLE (72, p. 768), and is Honourably Mentioned by the Jury.

Mr. PETERSON (66, p. 768) has a collection of small objects in Connemara marble, all of Irish manufacture, and very neatly executed. Some small table ornaments by Mr. RUMLEY (59, p. 767), Mr. WILKINSON (61, p. 767), and Mr. SIMMONS (Class XXX., 126, p. 829), may also be mentioned as neat and ingenious. A pair of small obelisks in polished oolite exhibited by Mr. J. BELL (57, p. 767) are very pretty illustrations of the material, and are well finished.

There still remain to be considered the ornaments of black and other marbles, chiefly from Derbyshire, exhibited by Messrs. HALL and TENNANT (37 and 38, p. 767), SELWY BRIGHT (80, p. 769), and J. TURNER (82, p. 769). The first (TENNANT and HALL, 37 and 38) have sent a fair variety, which have been considered worthy of Honourable Mention, as exemplifying the present state of taste and skill in working marble in the district in England where the greatest pains have been taken, and where the improvement is of longest date. Mr. Bright's vases are also Honourably Mentioned.

The series of Derbyshire goods, by these exhibitors, is in some respects excellent, and the imitations or models from the antique, especially the obelisks, both Egyptian and Nineveh, are very pleasing. The process of etching on marble, illustrated by some of the objects they exhibit, is also shown by Mrs. LAWSON (Class XXX., 47, p. 822), and Mr. E. BRAD (83, p. 769); but as it is not likely to lead to any improved process, and is of itself only an ingenious but not application of one of the Fine Arts to a material ill-suited for the purpose, the Jury make no further remark upon it. The two vases, sent by Mr.

BRIGHT, and the jugs by Mr. TURNER, all of black marble, are of elegant shape and perfectly well finished. Mr. VALLANCE, of Matlock, whose most important objects will be spoken of amongst inlaid work, has sent several articles of marble, among which may be mentioned five vases, some of good forms taken from the antique, an obelisk, three inkstands of black and rosewood marble, and a Roman bath of the same material. These are good specimens both of material and manufacture.

A tomb in alabaster, by Mr. CUNY (Nave, 60, p. 848), being a clever illustration of what can be done in this material, is considered by the Jury as worthy of a Prize Medal.

If from the British goods of this kind, we turn to those of other countries over which England holds rule, we shall find a number of striking and beautiful manufactures in marble sent by various persons from India, amongst which may be especially mentioned, the handsome white marble garden-seats, understood to be a present from the RAJAH OF NITTONE to Her Majesty (p. 921), and a large collection of objects of the same, or nearly the same material, exhibited by the RAJAH OF JOUDHPOOR (p. 921). These latter, amounting in number to 56, are perhaps more curious than beautiful; but they illustrate well the capabilities of the material. The former exhibitor has been considered worthy of Honourable Mention. Besides these things from India, there are a few specimens of manufactured marble from Van Diemen's Land, sent by Mr. J. BOYD (233, p. 991). These have been Honourably Mentioned by the Jury.

From France the miscellaneous objects in marble are but few, except those where marble is applied to furniture, and general purposes of decoration, combined with wood-work. Mr. SIMON, however (1016, p. 1227), has some marble ornaments.

Germany, like France, contributes few objects in marble of a miscellaneous character. There are, however, a model of a chandelier by M. NOX (1 Zoll., 418, p. 1074); a fountain by M. TACCHI, of Frankfort (5 Zoll., 21, p. 1122), and some small ornaments from the manufactory of Diez, in the Duchy of Nassau (8 Zoll., 5, p. 1132). The model by M. NOE has been deemed worthy of Honourable Mention.

The working of marble has been so long a staple manufacture of Italy, that we might well expect from that country a preponderance of such objects as illustrate the varied applications of this material to the arts, and to decorative purposes generally. To a certain extent, this is the case; but, although most of the productions of Italy are ornamental, they are not pre-eminent for novelty or variety. Among them, however, are some of extreme beauty and rare excellence.

The most remarkable of these objects, strictly belonging to the class of mineral manufactures, is a large vase of Oriental alabaster, executed by the Signor T. DALLAMONA (Rome, 19, p. 1286). The material is peculiarly adapted for such a work, but it is not usual to obtain so large a block absolutely free from imperfection. In the execution of the vase, the handles, which consist of serpents, are of the same piece with the body of the vase, so that the artist could not have used the lathe, either on the work itself, or in polishing. In most modern works of the kind, the handles are joined on after the completion of the object; and the great difficulties of marble-working are avoided (when there are no bas-reliefs round the outside) by placing the object between two centres. A considerable difficulty was involved in the nature of the material employed, and the necessity of chiselling away extremely minute portions in finishing the handles. In those parts which are most original, the perfect steadiness of the sculptor's hand is observable, and the confidence—amounting almost to rashness—in his own knowledge and experience. The whole of the vase has been finished with the greatest care, the polish being everywhere complete, no part being at all injured, and every detail tending to produce the beautiful effect which has been so greatly and justly admired. The Jury have awarded a Prize Medal to this exhibitor.

From Rome we also have a number of other works; some of them by the same artist, and in the same mate-

rial; but others by Mr. Van der Staat, exhibited by the proprietor, Signor DRES (pp. 1287, 1288). Among them are some models of architectural constructions and antiquities in fine Sienna marble, and a hollow altar of Oriental alabaster provided with a lamp, and intended to show the remarkable translucency of this material. All these are of excellent workmanship.

From Tuscany are exhibited several objects, constructed of the true alabaster, so abundant near Volterra. Among these a very beautiful and large vase by Messrs. G. CHERRICI and SONS (116, p. 1299) is Honourably Mentioned by the Jury, as well for the material as for the treatment of the subject and the mechanical execution. There is also a pair of large candelabra of brown alabaster exhibited by SOLAINT, of Leghorn.

Among the objects properly belonging to this group, may be mentioned, in conclusion, a *bagnivola* of lapis lazuli, extremely remarkable for its large size, and for the extreme purity and richness of the colour. For these reasons it is of great value, but has little beauty of form or excellence of workmanship. It is exhibited by Mr. JONES (Rome, 48, p. 1287), and is considered worthy of Honourable Mention.

#### F. WORKS IN ORNAMENTAL STONE, GRANITE, AND SPAR.

##### a. Serpentine, Granite, and Porphyry.

We bring together these materials more for convenience than for any marked similarity in the modes of working. The serpentines of England are not harder than the commoner marbles, and are worked in the same way; whereas the granites are extremely hard, and require peculiar treatment. There are not many exhibitors in these materials.

To Mr. J. ORGAN, of Pensance, in Cornwall (85, p. 769), a Prize Medal is awarded for his fine and well-selected group of objects, manufactured in the serpentine of the Lizard. The material, employed only by Mr. Organ and one other exhibitor, is an extremely beautiful marble of moderate hardness, differing essentially in this respect from the serpentine of Italy and Greece. The colour is extremely varied, but that which is commonest and most admired is a rich dark olive green, spotted with red, and traversed with veins, often of the purest white, but sometimes of dark crimson. The articles exhibited by Mr. Organ are remarkable for their large size, and the good taste they manifest, as well in the style of manufacture as in the selection of the specimen for the kind of work. They include a pair of obelisks, a font, and a chimney-piece, besides vases, and other smaller ornaments.

The exhibitor has the right of quarrying over an extensive district, chiefly occupied by the serpentine: the work is generally pursued in summer. About one ton in four of the rock is of fine quality; the blocks are generally small, though they have been obtained 7 feet long, and from three to five tons weight. A very beautiful and large specimen, partly polished, is exhibited outside the western end of the Building. It may be well to state that the cost per ton is from 5*l.* to 10*l.*, according to weight, and the price of slabs 1½ inch thick, and not exceeding 5 feet long, is 6*s.* per superficial foot from the saw, and 12*s.* per foot moulded and polished.

Mr. W. PEARCE, of Truro (75, p. 768), is an exhibitor of various objects manufactured from the serpentine of the Lizard, from steatite, also from the Lizard, and from the fine granite from Lamorna, Withiel, Luxulian, and other places in Cornwall. The whole group is of remarkable excellence, and the Jury have awarded a Prize Medal to the exhibitor.

The steatites of the Lizard differ little from the serpentines in their essential components, both being silicates of magnesia; although the former contain a larger proportion of silica, and the latter much more water of consolidation. Both minerals vary, however, much in composition, when in a massive state, and probably pass into each other in the Lizard rock. The serpentine is much harder than steatite, and is generally more richly coloured, so that the latter, although often beautiful, is better adapted for smaller objects than the former, which,

when in large blocks, has a rich and noble effect. Many of the small articles by this exhibitor, manufactured of steatite, are well worthy of notice.\*

Mr. Pearce also exhibits several pedestals, a large slab, and a chimney-piece of granite, and pedestals of porphyry. The style of the chimney-piece is heavy and massive, but not unsuited to the material; and its workmanship is decidedly good. The difficulties in bringing granite and porphyry to a perfectly plane surface without the lathe, have been very successfully overcome in the case of the slab or table-top, which is of large dimensions, and exhibits no flaws, and no imperfections of work.

Mr. J. H. MURDITH, of Fowey (Class I., 141, p. 136), exhibits three noble slabs of Cornish porphyry, one black, another red, and the third green; all of fine quality, and polished on both sides. The largest, which is of a fine red colour, took nearly four months to complete, the cutting being done by machinery, and the work going on night and day. It is absolutely without flaw or defect, and weighs about 8 cwt. The material is so beautiful, and the work so excellent, that the Jury have no hesitation in awarding a Prize Medal to this exhibitor.

The quarries from which these fine specimens of Cornish porphyry are obtained were first worked by Mr. J. T. Treffry, of Place, who commenced the erection of a hall, in which the various specimens are exhibited, and who greatly exerted himself to introduce the use of this material for decorative internal work, and for the Fine Arts.

The only exhibitors of Scotch granite in articles of any magnitude are Messrs. MACDONALD and LESLIE, of Aberdeen (74, p. 768), who have sent two vases, a pedestal, and a noble slab for a table-top. The Aberdeen granite differs from the Cornish, in being for the most part finer grained, and of a peculiar flesh tint. The specimens here exhibited are of the finest kind, and their workmanship is unrivalled. They are also in good taste, and although the material is not without flaw, this may be excused, when the large dimensions of the different objects and the rarity of perfect blocks are taken into consideration. To these exhibitors a Prize Medal is awarded.

There are one or two exhibitors of granite manufactured into articles of small size, and almost partaking of the nature of jewellery. Such are Mr. G. JAMIESON, of Aberdeen (Class I., 25, p. 123), Messrs. RITTIES and SONS, of Aberdeen (Class XXIII., 24, p. 625), and Messrs. ELLIS and SON, of Exeter (Class XXIII., 12, p. 674), the former of whom show some elegant forms sculptured in Aberdeen granite, and the latter, knife-handles, in similar material from Devonshire.

Of foreign porphyries there are few examples in the Exhibition, but amongst these we may mention a table, small column, and tazza, exhibited by Mr. CANTIAN, of Berlin (Prussia, 235, p. 1061), with some marble also worthy of notice. The table is a round slab of red colour, and fine texture, and the tazza-vase and pedestal are of the same material. They are all well-finished and creditable specimens, whether as regards material or execution. They are accompanied by a small column of polished garnet rock of very singular appearance. The Jury have awarded a Prize Medal to this exhibitor.

In the Scandinavian compartment there are several objects constructed of a very hard syenitic porphyry, found in detached boulders (erratic blocks) in various parts of Sweden, and also *in situ* in Norway. Of these, that numbered 43 (p. 1352) is from the Hjula quarry, in Norway, and is of a greyish-red material, probably rare. The Jury have awarded Honourable Mention to the Swedish porphyry work generally, including not only this vase, but another exhibited by Mr. Wallis (47, p. 1353).†

\* The articles here described are constructed of the more ornamental specimens of steatite, and are highly polished. Those previously alluded to (p. 559) are for economic purposes and are left rough. The material slightly differs also in composition.

† In the early part of the month of September, and after the awards of the Jury had been finally determined on, a

M. COLIN, of Epinal, in the department of the Vosges (France, 1864, p. 1251), exhibits a collection of the marbles, granites, and serpentine of that part of France. Some are of considerable beauty.

A vase and group of figures in Italian serpentine, exhibited by Mr. NONCHET (Class XXX., 309, p. 840), are mentioned here simply as illustrations of the material. Two large vases of a peculiar material called agate, marble, harder than alabaster, and nearly as transparent, may also be seen among the objects sent by this exhibitor.

*b. Jasper, Jade, Agate, Crystal, and Spar.*

The jasper and quartz rocks of Siberia, well known as materials of extreme hardness, worked only in the Russian empire, and rarely met with except as Imperial presents to princes and distinguished foreigners, furnish a group of very remarkable objects exhibited among the Russian goods, and deserving of notice on all accounts.

The material of some of these vases is quartz rock, but most are of a kind of pseudo-jasper, or pseudo-jaspic lava, of greenish colour and extreme toughness and hardness, resisting almost every tool, and requiring to be cut with emery in the manner of gems. These rocks chiefly exist in Siberia, beyond the Oural, and are in great abundance and variety. The vases exhibited from Russia are of this jaspic rock, and were worked at the Imperial manufactories of Ekaterinburg and Kolyvan. In these manufactories it is stated that almost the whole of the work is performed by manual labour; the only machine used being, in fact, a very simple kind of lathe, on which the object to be turned is placed, and worked by iron tools and emery. No tool will touch these stones: both chisel and file of the hardest temper turning without producing any effect. The time necessary for finishing vases of considerable magnitude is often many years, and their value must be calculated by the cost of the large establishment kept at constant work for the sole purpose of preparing them.

Of the works of this kind in the Exhibition, there is one of square form at the top, measuring nearly three feet on each side, hollowed under the rim, and ornamented with foliage in the hollow. This vase is worked with great skill and accuracy; but the colour of the jasper is not satisfactory; there are also some flaws: the size, however, is unusually large, and the labour of execution must therefore have been enormous. It was made in the Imperial Polishing Manufactory of Ekaterinburg, in Perm (Russia, 326, p. 1379), to the Official Director of which the Jury have adjudged a Prize Medal.

Several vases of smaller size are sent from the Imperial Manufactory of Kolyvan, Government of Tomsk, Siberia, for which a Prize Medal is also adjudged (Russia, 327, p. 1380). One of them is very beautiful, both in form and material, being an olive-green jasper urn, decorated with admirably worked foliage in relief. The successful execution of some of the legs must have involved extraordinary difficulties.

Although the vases exhibited from Russia are not, perhaps, the largest that have been prepared, the Jury are desirous of recording the expressions of their Chairman, in a memoir submitted by him to the Jury. "Such are the dimensions and weight of these masses of *pietra dura*, that I must say I know of no similar works; nor do I believe that any so difficult and well finished have been executed since the times of the Greeks and Romans." As

number of very beautiful objects were added to the Scandinavian exhibition, among which was one vase of polished granite of gigantic proportions, sent by His Majesty the King of Sweden, and manufactured at the Royal Porphyry Works of Dalecarlia, instituted to supply work for the poor peasantry. This vase is of very peculiar form, the principal and central portion being egg-shaped, and measuring 6 feet in height and 4 feet 4 inches in diameter in the largest part. Much larger objects have indeed been made in these works, one highly finished tazza being described, the diameter of which is no less than 11 feet, but this was too large to be safely conveyed. The vase is of a delicate pink granitoid porphyry, and is extremely admirable and perfect, both in design and execution.

examples of the same kind; and of those times, I would cite the statue of Rome in the Capitol, and a very beautiful fragment of drapery most exquisitely worked, both which are of porphyry. There are also, in Rome, some beautiful busts, of the size of nature, and of the most perfect finish, in basalt."

A large number of works in jade are exhibited, from India and China, together with a number of objects carved in quartz rock (rock crystal), many of them inlaid with gems, and of extraordinary richness and beauty. These works in crystal and jade involve nearly the same difficulties as those of jasper, just described; but many of them are of so small a size that they rather come under the denomination of jewellery, and are the work of the gem-cutter rather than of the sculptor. The same may be said of numerous objects in agate, cornelian, and other material, no doubt considered by the Jury of another Class. The objects of this description from India are remarkable for admirable execution, and elegance of shape. Those from China are equally well executed, but often exhibit monstrous and distorted forms. As, however, the members of the Jury were not permitted to examine the goods from China, they are not justified in recommending any reward to the exhibitor. The agates cut into various forms and exhibited abundantly from India, are well worthy of notice as mineral manufactures, but have been fully described both with reference to the material itself and the modes adopted in working it, in the Illustrated Official Catalogue. There will be found in that Catalogue a very interesting account of the large trade in hard stones and gems now regularly carried on in India; and great benefit might accrue if advantage were taken of the price of labour in the East, and opportunity given for supplying the European market with various articles made of these substances, and used in the arts.

The transition from gem-cutting, on this gigantic scale, to the true work in *pietra dura*, known as Florentine mosaic, is easy and natural. The material used in this latter kind of work is nearly the same in many cases, and the work differs only in its smaller size and greater delicacy of finish. Still the subject of mosaic or inlaid work is essentially distinct, and is more conveniently treated of under a separate heading.

Before concluding this part of the subject, it is necessary to allude briefly to the Derbyshire manufacture of fluor spar (locally called Blue John), often worked into vases and other ornaments. This material is beautiful, but rare, and requires great skill in working, owing to its extreme brittleness. It is only obtained in the massive state adapted for cutting from a single mine near Castleton. When the shades of colour are clear and well-defined, the mineral is used in its natural condition, and the fine specimens of this kind are very valuable; but in most cases it is necessary to expose the spar to heat, the temperature being regulated with great care. By these means some of the coloured bands become pale, and the remaining tints assume a peculiar purple or amethystine hue. All the varieties of colour of fluor spar are worked in Derbyshire; but the blue is the most esteemed. The manufacture of this material dates as far back as the middle of the last century.

The exhibitors of this mineral are, Mr. VALLANCE (40, p. 766) (who has a gigantic vase 39 inches high, eight other vases, twelve tazzas, and several other specimens), Mr. HALL and Mr. TENNANT (37, 38, p. 766), Mr. HEIGHT (80, p. 769), Mr. WOODBURY (77, p. 769), and Mr. JERSON (132, p. 776). The objects are vases, tazzas, and sundry miscellaneous ornaments, chiefly small.

*G. MOSAIC OR INLAID WORK IN STONE.*

The art of mosaic (*opus musivum* of the Romans), originally applied only to the combination of small dice-shaped stones (tesserae) in patterns, has very long been an important source of labour to the inhabitants of several parts of Italy, and under various modifications is now carried on in the principal cities of Europe. The manufacture has long ceased to be confined to combinations of tesserae, and is now understood to include all kinds of inlaid and veneered work, in whatever material.

We have here to consider those specimens in which marble and gems are the materials principally made use of; the Roman mosaics manufactured in glass being referred to a different group.\*

With this limitation there are still several kinds which we may conveniently treat of separately. They are,—

1. Florentine mosaic, or work in gems (*pietra dura*).
2. Derbyshire mosaic, imitative of Florentine, but in marble.
3. Russian mosaic, or inlaid work in malachite.

*a. Inlaid work in Pietra Dura*

This manufacture consists of certain kinds of hard stone inlaid in a slab of marble. They are, for the most part, those pseudo-gems, generally varieties of quartz, known under the names of agate, jasper, chalcedony, cornelian, &c.: but stones such as lapis lazuli, remarkable for their brilliancy and depth of colour, are also included, and come under the general denomination, of *pietra dura*. In this kind of work, a slab of marble (generally black) of the required dimensions, and about an eighth, or three-sixteenths, of an inch thick, is prepared, and the patterns to be inlaid are carefully cut out with the saw and file. The hard stones, worked into the required pattern by the ordinary methods of gem-cutting, are accurately fitted into the spaces thus prepared, in a polished and finished

state; for, if the whole were to be polished at once, some of the substances, being softer than others, would be worn away too rapidly, and the picture, instead of presenting a smooth surface, would be unequally polished, and the outlines would be granulated or chipped. The work, also, is liable to be spoiled by the accidental placing of one stone lower than another, and mistakes of this kind will often lead to the ruin of the whole. After the surface is thus prepared it is veneered on a thicker slab, and is then fit for use. In point of difficulty of execution, durability, and taste, this process of inlaying in hard stones, or gems, may rank as the most important purely decorative work within the whole range of mineral manufactures.

In order to illustrate the peculiar mode of inserting the different pieces of agate, jasper, &c., in these beautiful works of art, and to show also to those not familiar with them the elegant and simple forms produced, it has been thought desirable to prepare a diagram showing a fac-simile of a portion of the inlaid work in one of the tables exhibited. In this diagram, the hard line represents the outline of the flowers, leaves, &c., and the dotted part the lines where the different pieces forming a single object are joined together. The extreme delicacy and accuracy of the joints can only be fully appreciated by the examination of the original specimens.

Fac-simile of inlaid work in Florentine mosaic.

The principal exhibitors of true Florentine mosaic in *pietra dura* are the Brothers BUONINSEgni (Tuscany, 118, p. 1299), G. BIANCHINI (Tuscany, 119, p. 1299), and the IMPERIAL MANUFACTORY OF PETERSHOFF (Russia, 298, p. 1376). The two former exhibit good examples of the best manufactures of this kind. Most of the designs are in good taste, and all are admirably executed, but they do not present any great amount of originality. The Russian table is from a manufactory established for some time at St. Petersburg, originally worked by Italians, but now solely by Russians. The workmanship is in the highest degree creditable; but there is nothing original, either in execution, or in the arrangement of the different ornaments. Many of the jaspers and other stones are of great beauty, and are obtained from Siberia. Most of the stones used in the Italian tables are pebbles from the Arno. Prize Medals have been awarded to all these exhibitors, but the latter establishment is especially rewarded for the relief work about to be described.

A very remarkable, and extremely beautiful variety of

*pietra dura* work is exhibited in Russia (298, p. 1376). It consists of a jewel-case, understood to be the property of the Empress of Russia, constructed of wood, and having the four sides and top covered with groups of fruit cut in *pietra dura*, in a style which may be called *cameo-mosaic*, in rather high relief. The stones are so selected as to afford perfect fac-similes in colour, size, and even in internal structure, of the fruit they represent (currants, pears, plums, &c.), and the whole work is exquisitely finished. To the exhibitor of this, the Jury have also awarded a Prize Medal. They think it right, however, to add that, whilst fully admitting the extreme beauty of the general effect, and of the particular stones selected, they do not regard this style of mosaic as ranking so high as the inlaying of tables, inasmuch as the separate pieces are here cut and shaped independently of each other, and cemented on the surface they are to decorate, without having to be fitted to adjacent pieces before imbedding. There is, also, little danger of failure, even if the dimensions do not strictly correspond.

The goods recently added from the Royal Porphyry Works of Dalecarlia, and already referred to, include

an inlaid oblong table of granite, porphyry, and jasper, which deserves notice in this place, as well for beauty of workmanship as for design. The pattern is geometric, but very regular and elegant, and in very good taste. The materials are hard stones of the country, and the mechanical execution admirable; but being apparently of equal hardness, they admit of being polished after the whole is completed. It is exhibited by the KING of SWANSEA (51, p. 1853).

Closely allied to the Florentine work, but of even greater delicacy, and employing material yet more difficult of management, is an Indian chess-table (p. 921) with an inlaid border; and a number of small objects also from India, inlaid in the same way. The ground in these is a white marble, showing a peculiar saccharoidal texture. The pattern is a fine scroll-work, remarkable for the extraordinary delicacy and exactness of the stems of flowers, and the perfect joints. It has been said that the stems are filled in with cement; but if this is so, which is unlikely, it is almost more extraordinary than the inlaid work, the stems being nearly as hard as flint. A Prize Medal was awarded for these objects. There is another interesting piece of Indian inlaid work in *pietra dura*, said to be of great antiquity, obtained from Agra. It is exhibited by Mr. W. STEWART (33, p. 765). No comparison can be instituted between these Indian and the European works, the mechanical execution of the former being at least equal to the best of those which have rendered Florence so justly famous, while the taste and design exhibited in them are greatly superior.

#### *b. Inlaid Work in Marble.*

The great expense of inlaying hard pebbles, which can only be cut as gems, and the excellent effect that may be produced by imitations, in which marble of various kinds, shells, cement, and glass, replace the jasper and agate of Florentine mosaic, have caused the introduction into England and elsewhere of a manufacture which may be called inlaid marble work. Specimens have been sent in great variety from Derbyshire, where this manufacture has become very important; from Devonshire, where it is rising into importance; and from Malta, where something of the kind has been for some time known.

There are two principal methods of producing marble mosaic; that followed in Derbyshire, where a recess is chiselled out of a solid block of marble serving as the ground; and that pursued in Devonshire, where the whole surface is, in fact, *venezed*, numerous marbles of various colours and forms being merely cemented on a base, which may consist of slate or any kind of marble, the whole surface being afterwards polished together. The Maltese specimens appear to belong to the former kind; while the Russian malachites, which we must treat of separately, may be regarded as more resembling the latter. At first we confine ourselves to the Derbyshire work, which is truly inlaid.

To a very limited extent, and by a very rude method, the art of inlaying in marble was practised in Derbyshire many years ago; but within the last quarter of a century it has made great and rapid advance, and about ten years since, the introduction of Florentine patterns, imitated in various coloured marbles, has exerted a very important influence on the trade.

The first manufacture of mosaic in Derbyshire consisted of coloured spars and marbles, of irregular shapes, imbedded in cement, and afterwards rubbed down and polished; these were called "scrap tables," and were succeeded by slabs in which the spar and marble were cut into definite forms arranged in patterns; but these also were rudely finished, as the workmen were not skilled in the art of making accurate joints, and the forms selected were simple and geometrical. Up to this time the process was little more than veneering, and the results were rather imitative of brecciated marbles than intended to produce pictorial effects.

The present Duke of Devonshire, by permitting his fine collection of Florentine work to serve as a guide and model to the Derbyshire manufacturers, and even lending them the inlaid butterflies, leaves, sprigs of jasmine, &c., for which the Florentine mosaics are celebrated, induced

an imitation of a higher kind. The true art of inlaying was thus brought into successful operation, and materials foreign to the vicinity, as malachites from Russia, continental marbles, aventurine, and other glasses from Venice, with some cements, have been introduced. The use of these substances greatly diminishes the cost of the work.

The condition of the trade at present may be judged of from the articles in the Exhibition, which show much taste and skill, though but little originality. The manufacture is carried on at Matlock, Ashford, Bakewell, Buxton, Castleton, and Derby, and the number of persons employed as mosaic workers exceeds fifty. There appears to be a fair demand, and the prices, although sometimes high in London, are by no means extravagant at the place of manufacture.

Of the exhibitors from Derbyshire, Mr. VALLANCE (40, p. 776) may be mentioned as having sent two octagonal mosaic tables, and several small objects. One of these tables presents a wreath of flowers, of extremely complicated pattern, and very admirably finished, in a vast number of detached marbles. This table was exhibited, and is mentioned by the Jury as a finished specimen of Derbyshire work; but it must not be compared with Florentine work, inasmuch as all the materials are comparatively soft, and they include a somewhat undue proportion of shell, glass, and modified marbles. It is, however, a very creditable piece of workmanship, and deserves great praise for the skill and labour bestowed upon it. To Mr. VALLANCE a Prize Medal has been awarded, not for these tables only, but for his general collection of Derbyshire marble manufactures, which is in a very high degree interesting and instructive.

A large round inlaid table, four feet in diameter, partly composed of the productions of Derbyshire, is exhibited by Mr. G. REDFERN, of Ashford (78, p. 769), to whom a Prize Medal has been awarded. The general style of this table is good, and the marbles are well selected. There is, perhaps, in this, as in most of the Derbyshire inlaid goods imitative of Florentine work, a little too much use of glass, shell, and stained marble, which produce very brilliant effects, but are not altogether in such good taste as might be. An inlaid panel with a border by this exhibitor also deserves very great praise, both for design and execution.

Mr. WOODRUFF, of Bakewell (Class XXX., 350, p. 842), exhibits two oblong inlaid tables, in cinque-cento style, designed by L. GRUVER, Esq., and very well executed. The designs are particularly good and praiseworthy, and the Jury have noticed with much satisfaction that in this case effective aid has been afforded by an artist in elevating the mosaic manufacture of the district beyond the mere repetition of Italian patterns. It may be well to suggest here to the Derbyshire manufacturers, how much more creditable and ultimately successful it would be to place their work on a higher footing than it can be said to occupy at present, which might be done if the designs for their soft marble work were made with some reference to their material, which differs so much in hardness from the true *pietra dura* of Italy, and certainly admits of original treatment. In this view, and to mark their full appreciation of the originality of the design, as well as of the excellence of the workmanship, the Jury have awarded a Prize Medal to this exhibitor. In addition to these two tables, Mr. WOODRUFF also exhibits (77, p. 769) a black marble chess-table with a pretty inlaid border, equally creditable for taste and execution, and two vases, one of black marble, and one of changed flint, already alluded to.

The other exhibitors of Derbyshire inlaid-work are Mr. J. TOMLINSON (79, p. 769), who has several specimens, chiefly tables; Mr. S. BACOTT (80, p. 769), already mentioned for his black marble manufactures; Mr. J. HALL and Mr. TERNANT (37, 38, p. 766), who exhibit together a number of articles of Derbyshire work, and among the rest various inlaid tables, and smaller objects of considerable merit; and Mr. LOKAS (81, p. 769), who sends a chimney-piece of black marble, inlaid in mosaic, in a pattern to a certain extent original, though adopted from the antique. The attempt by this exhibitor to

introduce good designs in Derbyshire mosaic into house decoration, is referred to with satisfaction by the Jury; and they consider not only the idea, but, in a great measure, the design and execution of the work as worthy of the Prize Medal. The inlaid work is well done, though the introduction of Sienna marble in the capital of the columns supporting the mantel-shelf is injurious to the general effect.

We pass on to the marble mosaics of other parts of England. Of these, by far the best, in every respect, are sent from Devonshire, where the manufacture seems to be greatly advancing. To Mr. WOODLEY, of Torquay (89, p. 766), a Prize Medal has been adjudged for one oblong, and two round tables, the latter of very great merit, and also of considerable interest as illustrating the marbles of the district. The Devonshire work is, as has been already said, rather a veneering than inlaying process; but the result is so similar in appearance to that obtained in Derbyshire that they can hardly be disconnected. Mr. Woodley's large round table is of the kind called specimen tables, and the forms are geometric, but the execution is excellent, and the selection of marbles admirable. There is not in any of the tables by this exhibitor any attempt at originality of design. The oblong table contains a fine specimen of red marble.

Messrs. HOLLAND and SONS (Class XXVI., 161, p. 745) exhibit a cabinet made for Her Majesty. This includes a certain amount of inlaid work in British marbles, well designed and well executed. The Jury consider the mosaic work in this cabinet deserving of Honourable Mention. (Prize Medal awarded by Class XXVI.)

Mr. BOVET, of Plymouth, is also Honourably Mentioned as an exhibitor of inlaid Devonshire marble, in a chimney-piece exhibited by him (4, p. 764). The design of the work and the general effect are not particularly good, but the inlaying is well done, and the selection of material praiseworthy.

Mr. HUMBLE (9, p. 764) exhibits an octagon inlaid table, containing a mixture of British and foreign marbles. The design is geometric, and the execution tolerable. Mr. MOON, of Godalming, in Surrey (56, p. 767), has an octagonal table, inlaid with several kinds of marble, and tolerably well executed; and another is sent by Mr. W. PEARSON, of Harrowgate (65, p. 768), interesting as being chiefly composed of specimens from the neighbourhood of Knaresborough. Something of the same kind is shown by Mr. PIOW (80, p. 767). It is satisfactory to find this branch of industry, which involves a considerable amount of skill, and admits of the display and cultivation of much taste, extending itself throughout the British Islands, wherever material exists for its execution. In Ireland, also, the taste for such decoration is cultivated, and the Jury have pleasure in mentioning the tables sent by Mr. M. HOBAN, of Dublin (58, p. 767), which show much skill in manufacture, although they admit of improvement in design. Lastly, a mosaic chess-table is exhibited by Messrs. QUILLIAM and CARR (p. 136), manufactured in the Isle of Man, of Manx material.

Inlaid work has been executed for some time in Malta, on a considerable scale, and on a plan imitative of that pursued in Tuscany. Several tables have been sent for exhibition, and the Jury have awarded a Prize Medal to Messrs. J. DARMANIN and SONS, of Valetta (Malta, 26, p. 945), as an acknowledgment due to them for the design and execution of the specimens they exhibit. In these a black marble back-ground is introduced for the inlaying, which generally shows much accuracy of work with a very skilful use of material to produce the desired effect.

The designs introduced into the Maltese tables are, to a certain extent, original. The variety is also considerable, but there is generally a largeness in the details, which rather injures the effect, in other respects very good.

The polished inlaid work in stone sent from France is connected so closely with articles of furniture, and offers so little specially belonging to the present Class, that the Jury have not thought it necessary to report specially upon each specimen. They notice, however, a table,

by Mr. J. P. BOEAT, of Paris (France, 773, p. 1217), having an elegant scroll pattern of inlaid marbles, amongst which are some stones of harder material. The design and execution of this table are good; and the selection of material is worthy of notice. A Prize Medal is awarded to the exhibitor. There is also another Medal awarded to Mr. THERET (France, 1499, p. 1248), for sundry articles of furniture, decoration, &c., showing some originality and much excellence of workmanship.

Few inlaid works of any kind, in which marble introduced, are exhibited from the States of the Zollverein. One set of tables and slabs, &c., are, however, sent by Mr. DEVISSÉ (1 Zollv., 837, p. 1095) in which an artificial breccia is introduced with various kinds of marble. The style is that which we have already referred to as belonging to the earlier period of manufacture.

In addition to the exhibitors already mentioned, the name of Mr. GÄCKEN, of Vienna (Austria, 631, p. 1039), may be added, as having sent a closet of ebony with mosaic ornaments, and some other inlaid work, tolerably well executed.

From Lisbon a somewhat interesting specimen of mosaic is sent by Mr. C. BONNET (Portugal, 258, p. 1370), composed of sixty specimens, and various ornamental stones, all of the province of Alemtejo. This table was produced in the manufactory of M. Dejeant, a large exhibitor of Portuguese marbles.

From the Cape of Good Hope a peculiar kind of inlaid work in marble is sent, which, though hardly very ornamental, is not the less interesting, as illustrating the industry of that colony (58, p. 952). Another specimen of somewhat different kind, in a geometric pattern, exhibited from Tunis (p. 1413), illustrates a similar manufacture carried on in the northern extremity of the same continent.

### c. Inlaid work in Malachite.

Malachite is a peculiar mamillated or stalagmitic form of the green carbonate of copper, chiefly found in an available state for inlaid work in a very few localities, in Siberia, and lately in South Australia. It has been long employed in Russia in this manufacture. The mineral is remarkable for its fine emerald green colour (often presenting several distinct shades in the same specimen), its brilliant and silky lustre, and compact texture. It is softer than marble, very much heavier, and by no means so easily worked, owing to its brittleness and the concentric arrangement it generally presents. It can rarely be found in masses weighing more than ten to twenty pounds, and good specimens have a very high value, as the finer kinds are used exclusively for decorating purposes.

The most important locality at present known for the finer kinds of Siberian malachite is in the copper ground of Nijny Tagilk, in the government of Ekaterinburg, situated on the River Tura, a tributary of the Irtysh, on the Siberian side of the Ural Mountains, in latitude 57° 45' N., longitude 56° 45' E. In a mine at this place, belonging to MM. Demidoff, Sir Roderick Murchison has described an enormous mass of malachite, which, at the time of his visit, more several years since, had been recently discovered at the depth of 230 feet, strings of green topaz conducting to it; and these strings, increasing in width and value, were found to terminate in a vast irregular botryoidal mass, estimated to contain not less than half a million of pounds of this valuable mineral.\* The larger blocks, when exposed to

\* "The geological interest attached to this mass lies in the indication it affords, that the substance called malachite has been formed by a cupriferous solution which has successively deposited its residue in the stalagmitic form. 'Mutatis mutandis,' this mass has only to be viewed as formed of calcareous spar, and it presents every one of the features so well known to those who have examined stalagmitic grottoes with their stalagmitic floors in the clefts and caverns of limestone, or still more those large masses of tufa which have proceeded from calcareous wells. Wherever a portion of the malachite has been broken off, the interior is seen to consist of a number of fine laminae (a fasciculus of radio-concentric globules), which invariably arrange themselves equably around the centre on which

Fac-simile of a portion of veneered malachite. The joints are marked by fine dotted lines, and the darker portions represent the artificial malachite breccia or cement. The dark lines represent the natural concentric markings of the mineral.

the air, break up into smaller fragments, rarely weighing more than from one to about four pounds.

It is by no means a modern application of this material to employ it in inlaying or veneering for various decorative purposes; and few palaces, or large public museums in the principal capitals of Europe, are without specimens, marking the progress of the manufacture from time to time, and generally regarded, from their great rarity, cost, and beauty, as worthy of being made Imperial and Royal presents. It is, however, only lately that MM. DEMIDOFF, the owners of the mine in which the mineral occurs, have established at St. Petersburg a manufactory under the direction of M. LEOPOLD JOFFRIAND, where, after numerous trials, and the expenditure of much capital, labour, and ingenuity, it has been found possible to produce such works as those sent to the Exhibition. To MM. DEMIDOFF, the owners of this mine and factory, the Jury recommended, and the Council of Chairmen awarded the Council Medal, in testimony of the magnitude and importance of the objects exhibited, their extraordinary beauty and richness, the excellence of the production, and the application of various new methods of manufacture. These are chiefly seen in the construction of the doors, and more especially in the ingenious and beautiful manner in which the pattern is adapted to the material, the detached pieces of mineral being fitted to each other so as to preserve this pattern. They may also be noticed in the nature of the cement, which, being

they have been formed, and are adapted to every sinuosity of the pre-existing layer; here presenting a dark line, there a bright and light one, just as the solution of the moment, the day, or the hour, happened to be more or less impregnated with colouring matter. Besides round concretions, sometimes almost spherical, and also depressions of the surface, the under-sides of this malachite are singularly analogous to that of any large mass of calcareous tufa, in presenting prominent finger-shaped stalactites which are also composed of concentric laminae. The external surfaces of these concretions are frequently covered with a black ore of manganese, which usually falls on being touched."—*Merchins's "Russia and the Tied Mountains,"* vol. 1. page 274.

mixed with broken fragments of the malachite itself, does not interfere with the plan, or in any way injure the effect of the whole.

The working of malachite on a large scale is extremely tedious and laborious, and is understood to be thus conducted:—The fragments of the stone are first sawn into thin plates, the thickness of which, for plane surfaces, is about a line, and, for curved parts, a line and a half. This cutting is performed by means of vertical circular saws: the blocks of malachite being cemented on a carriage, which, by means of a counterpoise, is made to travel along a small railroad placed on rollers, and is so contrived as to present the malachite in such a way as to insure the required thickness, and keep the mineral constantly pressed against the saw. Fine sand and water are continually supplied to the part in contact with the block, and the latter is thus slowly cut through, but retained in its position by means of the travelling frame already described. As soon as a plate is cut off, it is removed, the machine reset to cut another plate, and the work recommences.

The portions intended for curved surfaces are cut by bent saws fitted to the required shape, an operation which requires a large number of saws, and great care in cutting, as it would not be safe to trust to cement for filling up spaces, and some of the joints require to be very neat.

The next process in the manufacture is the fitting together the different plates, and cementing them. For this the first thing to be done is, to determine the pattern which the markings of the malachite are to represent. When this is decided on, the surfaces by which the separate fragments of the mineral are to be united are prepared, by the aid of wheels of copper, in such manner that for each joint two wheels are required, the projecting parts of one fragment entering a corresponding recess in the other. Joints thus made are not easily noticed, being formed with great accuracy, and not presenting any break or straight line to the eye. Until the establishment of their present factory by MM. Demidoff, the joints were straight, having no reference to the natural veins or lines of the malachite, and thus surfaces were placed together in which these lines were not continuous,

and had no relation with each other or with any regular pattern. The annexed diagram will show in some degree how this disagreeable result is now avoided. It is a facsimile of a small part of the superbly executed pair of doors, which formed so prominent an object in the Russian Exhibition.

The substance on which malachite is veneered is generally iron or copper, but may be stone or marble. When this is covered, the surfaces require to be levelled, which is done by means of sand. The interstices, of which many are left during the work, are then filled with a cement mixed with fragments of malachite, and coloured with powder of the same material; but in this part of the process, much care is required lest fragments should be introduced which do not adapt themselves to the pattern, and which would therefore injure the harmony of the work. The surface is finally polished.

In the above diagram any one acquainted with the usual veining of malachite, or even of stalagmitic carbonate of lime, will not fail to notice how completely the character of the natural markings is preserved in all essential places. When the nature of the work admits of it, however, the straight line is still preserved, as the joint can be made very accurate and extremely faint, although it is often purposely left thick and dark. In certain places, especially where a difference of pattern was rendered necessary, the presence of the breccia cement—which, owing its colour entirely to powdered malachite, is of precisely the same tint—forms an agreeable break, and greatly adds to the effect.

The quantity of malachite obtained from the mine, and brought into the market annually, is very small; and the price of the raw material is considerable, averaging about 16s. per pound avoirdupois. The loss in the manufacture being very great also, the cost is much increased, as one pound of the raw material after being sawn does not give more than half that weight of cut slabs; and this half is further reduced to a quarter of a pound before the slabs are fitted, cemented down, and polished. The ultimate value is thus upwards of three guineas sterling per lb. avoirdupois, and a square foot of finished work would generally contain at least two pounds and a half.\*

The objects exhibited by MM. DEMIDOFF consist of a pair of folding-doors, several vases, a chimney-piece, a table, a set of chairs, and sundry smaller articles. Of these the doors and vases are at once the most important, and the most highly finished; and it is understood that the former required the constant labour of thirty workmen employed by day and night during a whole year. They are most skillfully and beautifully planned, and the workmanship, as well of the plane as of the rounded surfaces, is in all respects admirable. The other objects are almost equally well executed, with the exception of the clock-stand, in which the joints are constructed according to the old system. It is said that there are in some of the churches, and perhaps elsewhere in St. Petersburg, fluted Corinthian columns of malachite, exhibiting the art of the manufacturer in a yet more striking manner than is seen in any of the specimens now in England; but certainly no examples have been seen out of Russia which at all equal in magnitude or artistic perfection those here described. It has been already stated that the Messrs. DEMIDOFF have received a Council Medal for these magnificent and costly objects, and the exhibitors are regarded by the Jury as worthy of the highest honour for the vast and successful efforts they have made to do credit to the manufactures of their country, and add to the interest of the Great Exhibition.

\* By information received since this Report was in print, it appears that the prices vary from 12s. to 17s. per lb. according to colour, rather than veining, the darker colours being cheapest. There are four shades quoted, denominated respectively *foncé*, *ordinaire*, *clair*, and *paie*, but these are also subdivided, the two first into *rondes* and *longues*, the others into *rondes*, *longues*, and *tachetées*. A large proportion of the malachite in the specimens exhibited was of very good colour, and the average value probably exceeded 15s. per lb., though it was less than 16s., as stated in the text.

It would not, perhaps, be fair to institute a comparison between the malachite goods from Russia and those manufactured elsewhere; and certainly the articles exhibited of this kind from Paris and Derbyshire must be mentioned but as attempts at the same material. We have only, therefore, to state, that Mr. VALLANCE (40, p. 767) has exhibited a large oblong table of considerable pretension, inlaid with malachite, partly Russian and partly Australian; and that a similar table of less pretence and much smaller size is among the goods sent by M. MATIFAT, of Paris (France, 933, pp. 1224). The former is remarkable as introducing specimens in which *azurite* (blue carbonate of copper) is combined with the malachite; but the mechanical construction of the joints is according to the old method, and the lines of the different fragments are not connected so as to form a definite and recognisable pattern.

Numerous small objects in malachite are exhibited, but none of these require special notice.

#### H. ENAMELLED SLATE AND OTHER IMITATIONS OF MARBLE.

The present seems the fittest place for describing various modifications of stone, slate, and marble, which exhibit permanent and useful imitations of other more expensive materials. It is manifest that good and lasting imitations of the finer marbles, executed in stone, slate, &c., are calculated to add to the advantages that arise from the employment of ornamental work in furniture and decoration.

The only exhibitor of an imitation of this kind, whose works can be described as extremely remarkable and worthy of detailed notice, is Mr. MAGNUS, of Pimlico (46, p. 767), who, by means of a new, very simple, and inexpensive process, has succeeded in producing works of great magnitude and importance, calculated to effect the introduction of slate for household purposes on a very extensive scale. The advantages of the material as thus used consist in its great strength, its lightness, as compared with that of marble, and its adaptability to all kinds of artistic decoration at a small cost.

With regard to the strength of slate, it is computed to be about four times that of ordinary stone, and slabs 8 feet long and upwards can be very safely used of thicknesses not exceeding half an inch. The extreme compactness of the material, and its perfect non-absorbent qualities, render it well adapted as a lining for walls, where it may be placed without even plastering. In this respect it is preferable to any kind of cement. In the decoration, the exact method of laying on the colour is not communicated; but the slate, after being coloured, is exposed for several days to a temperature of from 300° to 500° Fahr., and the colours are thus rendered so permanent that washstand-tops and other articles used in hotels for years have been scarcely injured by wear. In respect also of its peculiarly smooth and perfect surface and fine texture, it is admirably adapted for various ornamental and useful purposes; and grooves, mouldings, &c., are run with great despatch and at small cost by steam power.

In point of execution, both mechanical and artistic, the greatest possible credit is due to this exhibitor. He has produced a vast variety of articles, many of which are now in common use; and, in all, the price is so very much less than that of the substance imitated, and even of any other imitation that can at all compete with it, as to insure a large and permanent demand from the public.

The most remarkable object exhibited by Mr. Magnus is a bath-room of large dimensions, good design, and great beauty, wholly manufactured of decorated slate. The peculiar effect of the slate, as enamelled for use, is perfectly well shown in this specimen, which has received the careful attention of the Jury.

The following is a list of some of the principal objects manufactured by this exhibitor:—Chimney-pieces, table-tops, pilasters, skirtings, sideboards, billiard-tables, ornamental dairies, monuments, mural tablets, altar tablets, sun-dials, clock-faces, pedestals, baths, vases, chiffonniers, candelabra, lamp-tubes, &c. Of all these, the billiard-

tables are, perhaps, the most important, as being decidedly superior to tables constructed of any other material. Slate for the bed of the tables has been employed for some time; but as its weight caused the mahogany legs to become rickety, slate legs and frames have also now been introduced by the exhibitor, which being dovetailed together, the use of iron is avoided, and the tables are steady and durable.

To this exhibitor the Jury have had no hesitation in awarding a Prize Medal, in acknowledgment of his admirable and useful contrivances and applications.

Mr. T. STIRLING, jun. (Class I., 209, p. 141), who exhibits a large collection of unpolished slates already fully described (see page 558), and who has been adjudged a Prize Medal for these objects, has included within his group several specimens of enamelled slate highly decorative, but not prepared in the method adopted by Mr. Magnus. Mr. T. STIRLING, sen. (Class XXVII., 120, p. 773), has also exhibited similar articles, consisting of tables, inkstands, &c. These are handsome, and some of them show artistic merit, but they cannot be compared with the results obtained by Mr. Magnus.

There are several exhibitors of imitation marbles on slate and stone. Mr. BRADLEY (35, p. 766) has a small slate table, carefully painted in imitation of Devonshire marble. Mr. HALL (42, p. 766) illustrates the method of writing on slate. Mr. THORNHILL (48, p. 767) shows a pair of tables also imitative of marble.

#### DIVISION II.—MINERAL MANUFACTURES IN PLASTIC MATERIAL AND ARTIFICIAL COMPOUNDS.

Under this head it is meant to include manufactures in cement and artificial stone, scagliola work, and glass mosaic; manufactures in all varieties of clay, including bricks and tiles, fire-clay goods, stoneware, and terra cotta; and manufactures which have been referred to this class but are of a miscellaneous character, falling more naturally under this than any of the other divisions.

It may be necessary to state, as a more complete definition of the groups suggested, that all materials in which distinct chemical action takes place before they assume the form in which they become marketable, are regarded as *cements*, while those that are simply burnt, whether surface-glazed or not, are regarded as *clays*. The common cements and plasters, and various articles of manufactured glass, &c., considered to belong to this class, as Roman mosaics, thus belong to the former group, while terra cotta, salt-glazed ware, fire-clay goods, &c., are referred to the second group, being considered as manufactured clays.

#### Group 3.—MANUFACTURES IN CEMENT AND ARTIFICIAL STONE, &c.

The number of exhibits in these materials is not very large, nor are the objects exhibited numerous or from many countries, but they are by no means unimportant. They include, however, the remarkable and beautiful mosaics in glass, manufactured chiefly in Rome, besides a number of other mosaics, and some miscellaneous articles not fitly included amongst glass and porcelain. They consist, principally, of all the varieties of manufactured cements, such as simple concretes and mortars, Roman and Portland cement, plasters of various kinds, scagliolas of all kinds, and many other like objects.

Of twenty-one English exhibitors in this group almost all have illustrated the decorative as well as the more substantial uses of cement, while several have only sent the former kind. Italy, which comes next in order, is much more remarkable for the beauty of the manufactures, the list including no less than seven exhibitors in Roman mosaic, and two in imitated scagliola. From various parts of Germany, including Austria, there are about eight exhibitors, chiefly of the less decorative kinds, and from France there are six, also little decorative. Belgium has two exhibitors in ornamental cements, and Greece one in puzosolans.

#### I. MASSIVE AND INCRUSTED CEMENTS.

Under this head will be included common mortar and other simple lime cements, Parker's, Portland, Medina, and other hydraulic cements, various artificial stones (not terra cotta), and scagliola work of the usual kind, as well as new modifications of this manufacture. It may be expedient to explain very briefly the basis of the various cements here enumerated, and the chemical principles involved.

When common limestone of any kind, unmixed with other mineral substances, is exposed to considerable heat, it changes its appearance and character, swelling out, and passing into a white powdery material, greedily absorbing water with the evolution of much heat, and known under the name of *quick-lime*. If a paste is made with this lime and water, and the mass be exposed to the air, the result is a loose and friable hydrate of lime; but if a thin bed of such paste is interposed between two porous stones or bricks, the water is absorbed into these substances, and the thin bed of hydrate of lime that remains takes the consistence of stone, and adheres strongly to the two surfaces with which it is in contact. This is assisted by mixing the paste with sand and gravel, to the extent of two or three times its own weight, since the adhesion is greater to the foreign substances than to the particles of the hydrate of lime itself. Such a mixture is the common *mortar*, used by masons and bricklayers, and as it only hardens after exposure for some time in dry air, it is not surprising that in damp places it sets with great difficulty, and in water has no tendency to consolidate at all. When it is required to fasten stones and bricks together in moist places or under water, another substance is needed, and this is called *hydraulic lime*, or *hydraulic cement*.

There are, however, many kinds of hydraulic lime. The simplest is obtained when about 10 or 15 per cent. of clay (silicate of alumina) is combined with the original limestone, and when the calcination is not carried too far. In this case the resulting lime solidifies under water, the hydrate of lime combining with the silicates of alumina and lime, and producing a new substance, insoluble in water.

Many calcareous clays or argillaceous limestones exist in nature, having such properties as lead to this result. When the proportion of clay is only about 10 or 12 per cent., the mortar made from them takes about 20 days to harden in moist places. When, however, the proportion of clay reaches 20 to 25 per cent., the hardening is complete in two or three days; and when it exceeds this, and is as much as from 25 to 35 per cent., the ratio of drying varies according to circumstances, but may be very rapid. One kind of lime obtained from such an admixture of material as the latter is called Parker's, or Roman cement, but there is much difference in the quality of the material, greatly affecting the value of the result. It is generally considered that a minute division of the clay, and a state in which part of the silica is given up on the application of caustic potash, gives the best results.

Roman or Parker's cement is made in England from nodules of calcareous matter, collected in bands in the Lodon clay of Sheppey and Harwich, the Oxford and Kimmeridge clays (chiefly from Weymouth), and other similar deposits. Sometimes (especially in the former case) these have been washed out to sea and are there dredged up. The so-called Medina cement is of this kind but of lighter colour, and is made from the Hampshire septaria. A large quantity of excellent hydraulic mortar is also made from the lias (known as Atkinson's or Mulgrave cement) and from some other rocks. The price of Roman cement is now from 30s. to 40s. per ton, and upwards of two millions of bushels are annually made from the material obtained from the Essex coast, near Harwich.

A most important hydraulic cement, called *Portland cement*, is made from carbonate of lime, mixed in definite proportions with the argillaceous deposit of some rivers running over clay and chalk, pounded together under water, and afterwards dried and burnt. The strength of this combination is very remarkable, being nearly four

times as great as that of any natural kind. Portland cement makes an admirable and most powerful concrete, the proportion of cement required being only a tenth or twelfth part.\*

It is not difficult to procure artificially mixtures of limestone and clay, which are less costly than the natural kinds, though not equal in value.

On the Continent similar material is obtained in various localities, of which we may mention Boulogne, Vassy, Pouilly in Burgundy, and some parts of Russia. In some cases these cements appear to owe their hydraulic qualities to the presence of silicate of lime and silica rather than clay.

Certain substances also exist in nature, and can be imitated by art, which, on being mixed with common quick-lime, form hydraulic mortar. These are called *puzzuolana*, and consist generally of volcanic ash, of which a vast quantity is found in the modern volcanic districts of South Italy, Greece, &c., and in the extinct volcanic districts of the Rhine, Auvergne, &c., but similar substances are found in our own country. Mortar made with *puzzuolana* has extraordinary hardness and durability, this substance having a great affinity for lime and hydrate of lime, and forming a perfectly insoluble compound.

The cements hitherto described are composed essentially of carbonate of lime, from which both the carbonic acid and water are driven off by burning in a kiln. Another group, however, exists which we may call *plasters*, of which the base is sulphate of lime, or gypsum, usually found in combination with nearly 24 per cent. of water, and often containing carbonate of lime and clay in small proportions. On being burnt at a low temperature this mineral simply parts with its water, which it absorbs again readily, and with great rapidity, on subsequent exposure; but if a greater heat is applied it melts, and when cooled assumes a new and permanent form, not altered by wetting.

The property possessed by gypsum, of parting readily with its water of solidification, and re-absorbing it as readily, is the basis of a vast variety of uses to which this mineral is applied. When mixed with water mechanically, after being calcined, a part of the water enters into combination with the powder, and forms a true hydrous sulphate of lime, which collects into minute crystals, fitting into each other, and the mass becomes rapidly solid, although not very hard. If the solidification takes place in a mould, the most minute cavities are found to have been filled, and the result is a perfect cast, owing to the expansion that takes place while solidification goes on. Thus the calcined gypsum, mixed with water, becomes an admirable material for casting, and is greatly used for this purpose. Vast quantities of gypsum, of various degrees of purity, are found in the immediate vicinity of Paris, and thus the powder obtained after burning is generally designated *Plaster of Paris*. It is employed very extensively in constructions for various kinds of internal work. *Stucco* is a combination of the same substance, with a solution of gelatine or strong glue. This mixture dries more slowly than that made with water, but is more durable.

Sulphate of lime is the basis of all the cements known as *Keene's*, *Martin's*, *Parian*, and some others, but in these the plaster in the state of fine powder is thrown into a vessel containing a saturated solution of alum, sulphate of potash, or borax. After soaking for some hours it is removed and air-dried, and subsequently rebaked at a brownish red heat. When taken out of the oven it is once more reduced to a fine powder, and carefully sifted, after which it is fit for use, but when slacked a solution of alum is employed instead of pure water. When borax is used, the plaster is called *Parian*, but in the other case it forms *Keene's* cement. The kind called *Martin's* cement is made with pearly ash as well as alum, and is baked at a much higher heat than the rest.

The raw material for these various cements, of which the consumption is now extremely great, is obtained from

Derbyshire, Nottinghamshire, and Cumberland, besides the neighbourhood of Paris. The quality differs much, but for the finer kinds of cement the most crystalline is considered the best. Vast quantities of gypsum exist in Tuscany, much of it in the crystalline form called *alabaster*. The English gypsum is sometimes in beds of very variable thickness, sometimes in lenticular masses, and occasionally in veins. It occurs extensively in the new red sandstone, but also in the clay deposits of theoolitic period. The harder kinds make the soundest plaster, containing generally a little lime, but the purer kinds are much whiter when burnt. In France the gypsum is burnt in open kilns, and is thus discoloured, but in England this is avoided, the fuel not being allowed to come in contact with the plaster.

A highly ornamental material, consisting of a coating of plaster mixed with alum and colour into a paste, and afterwards beaten on a prepared surface with fragments of marble, &c., has long been known under the name of *scagliola*, and is greatly used as an excellent and economical means of imitating the finer kinds of marble, the material being as hard as marble, very durable, cold to the touch, and taking a perfect polish. The name *scagliola* is derived from the Italian, where the process is said to have been invented more than two centuries ago, but it is now very extensively used for decorative purposes in England. The cement is prepared from the finest gypsum, broken up before calcining, and afterwards reduced to a fine powder and passed through a sieve. It is then mixed with aluminous matter, and isinglass, and also with colouring matter, and is afterwards made up with alum; and as it is generally made use of only where the more beautiful and veined marbles are to be imitated, as many different colours and shades of colour must be mixed up separately as there are in the kind of marble to be represented. Thus prepared, it is ready to be laid on to the surface intended to receive it, which has a rough coating of lime and hair already prepared.

The different colours having to be laid on and mixed by the hand, the work somewhat resembles that of the fresco painter, everything depending on the skill of the operator in imitating the style, beauty, and veining of the original. When the cement is laid on and has hardened, the surface is prepared for polishing by rubbing it with pumice-stone, and cleansing with a wet sponge. It is then polished by rubbing, first with tripoli and charcoal, then with felt dipped in tripoli and oil, and lastly with oil alone. A durable lustre is thus obtained, equal to that of marble.

With this general outline of the nature and use of the various cements and plasters in which carbonate and sulphate of lime are the essential ingredients, we pass on now to the different exhibitors in these materials. There are several in each, chiefly from our own country and Italy, so far as larger and more ornamental specimens are concerned. They show some novelty and much excellent work, and form a very interesting and important group of objects. We commence with those who chiefly exhibit the cements properly so called, and the larger groups of objects, as applied rather to construction than decoration, and shall afterwards proceed to the plasters and scagliolas.

#### a. Hydraulic Cements.

Messrs. ROBIN, ASHPIN, and Co. (Outside, West, 5, and Class XXVII., 103, p. 772) are exhibitors of a gigantic slab of Portland cement, measuring 30 feet by 12, and 10 inches thick, weighing 15 tons; numerous blocks of cement and concrete, proved to various pressures, up to 154 tons, showing the strength to be greater than that of Portland stone; of bricks cemented together and placed so as to give a pressure of 3 tons on the first brick; and of several other similar illustrations.

It has already been said that Portland cement is a hydraulic mortar, made of a mixture of chalk and a peculiar river silt. In working it is sometimes mixed with sand and even with broken brick, forming a kind of concrete of extraordinary strength. It receives its name from its peculiar colour, which approaches that of Portland stone, and not from being made from that stone,

\* See an account of experiments on the strength of Portland cement, p. 587.

or in any way obtained from the Isle of Portland. Its hardness is very great, and it may be used with advantage, not only as a cement, but in many cases where ordinary stone is generally employed, and is even available for tanks and cisterns, being, when carefully manufactured, absolutely non-absorbent of water. The Jury have awarded a Prize Medal to these Exhibitors, as showing specimens on a very large scale, admirably illustrating the use, the strength, and other capabilities of the material they manufacture. In addition to the illustrations afforded by specimens sent for exhibition, Messrs. ROBIN and ASHDON, as well as other Exhibitors (Messrs. J. WRIGHT and Co.), have tested the strength of their cements of different kinds, in the presence of some members of the Jury, and the results of these experiments will be included in an appendix to this part of the Report.\* They will be found to contain facts and results of great scientific interest and practical importance. These Exhibitors illustrate the use and comparative strength of several admixtures, consisting of different proportions of Portland cement with sand, broken brick, and other fragmentary substances, and the experiments sufficiently demonstrated the great strength of these valuable cements, and the different modifications of them.

Mr. J. SEELEY (Nave, West, 88, p. 862, and Outside, West, 11, p. 114) is the exhibitor of a large fountain, intended for a market-place, occupying a prominent position in the West Nave, and also of a figure of Mercury in the West Enclosure outside the Building. Both of these are of artificial stone, and although the former does not exhibit the material under very favourable circumstances, the Jury are satisfied that the general reputation of Mr. Seeley, and the uniform excellence of the material he manufactures, deserve to be rewarded with a Prize Medal.

It may be well to refer here to a great want manifest in this fountain, and in many other objects manufactured of artificial stone both by the present and other Exhibitors; we mean the necessity of some adaptation, not merely to the purpose required, but also to the material to be employed, a necessity too often lost sight of by those who provide and execute designs.

Messrs. R. and W. TRAGLE (Outside, West, 3, p. 118) have sent a figure in Portland cement, exhibiting some merit in execution, and modelled from a figure of Lazarus in wood. \*It must be remarked, however, that there is a want of taste and consideration in thus copying in an imitation of stone, what was carved in and adapted for wood. The treatment and feeling of true works of art must and ought to take their tone from the material employed.

Mr. J. BOARD, Bridgewater (by his agent Mr. Donohue), is the exhibitor of four figures in Portland cement, two of them outside the Building in the Western Enclosure (3, p. 118), and the others in Class XXVII. (94, p. 771). These figures belong to a numerous class intended for garden decoration, and are not unpleasing in themselves, although the colour and finish of the material are not very satisfactory. We also have Mr. F. GREAVES (Class I., 99, p. 131) exhibiting several figures and other objects in cement which offer little for observation.

Mr. FUSSE (Outside, West, 19, pp. 114, 115) has sent specimens of an artificial stone invented by him, and manufactured since 1838, adapted for flooring damp places and other purposes. This material is of rather dark colour and considerable hardness; it may be cast in slabs of considerable size (up to 8 feet by 5), and is applicable for cisterns and drains, both pipe-drains and inverts for sewers of large dimensions. It has also been used for fortification-works, as a cement for bricks, for lining prisons, casements, &c., and for many minor uses. It is non-absorbent, and is said to stand exposure well. The price of this material in slabs is 6d. per square foot, up to 2 feet square, and for other works it is cheap in proportion. It was first invented in Hamburg, and is said by the manufacturer to be used on the Continent in many extensive works for drainage and fortification. The Jury have adjudged this manufacture to be worthy of Honourable Mention.

Other exhibitors of cements, more or less completely manufactured, but not strictly decorative, and not including coloured or scagliola work, are Mr. T. SKIRTH (Class I., 177, p. 189), who shows two blocks of concrete manufactured of the Mountfield lime, Sussex, a material very well adapted for submarine work; and Messrs. GARFITH and STONG, of Whitby (Class XXVII., 67, p. 766), who also show cement stone and cement (Malgrave's) in its application to building purposes for agricultural cottages. We may mention here, also, some blocks of Medina cement exhibited by Messrs. FRANCIS and SON, who, having obtained a Medal for their Parian, will be more fully referred to when the scagliolas are described.

M. AGOMBART (France, 2, p. 1169) has received Honourable Mention from the Jury for the hydraulic cements which he exhibits, and of which he is the manufacturer. The hydraulic nature of the cement exhibited by M. Agombart is derived from the kind of puzzolana which he uses, rather than from any natural qualities the stone possesses; but the Jury having the opportunity of seeing and comparing the various cements exhibited, find that this is somewhat light and porous. They understand that it is made of a limestone containing a certain proportion of silica.

Messrs. REGNY and Co. (France, 1427, p. 1244) have obtained Honourable Mention for an hydraulic lime by a mixture of burnt and unburnt stone, so that the result is another modification of puzzolana. The method is ingenious, and the result is said to be satisfactory, but the Jury regret that in this and several other cases before them, it is quite impossible to come to any definite conclusion, as the test of experience is the only one that is of any value, and they have no means of judging beyond the mere examination of a material exposed to no test, and exhibited on a very small scale. This remark applies to the objects exhibited by M. DE RUOLZ (France, 1466, p. 1246), which consist of a number of bottles filled with cement, and M. HELLEGENTHAL (France, 259, p. 1189), who shows some very neatly finished objects in a hard mastic, beautifully and delicately constructed and adapted for architectural decoration. M. EVROT is another French Exhibitor (190, p. 1183), concerning whose performance the Jury have no remark to offer. Both these Exhibitors are Honourably Mentioned.

From Belgium there are two Exhibitors in cement, Mr. C. SOETENS (424, p. 1164), and Mr. N. FOLLER (426, p. 1164). Neither of them admit of any detailed notice.

From Central and Southern Europe there are a few cements, the most interesting of which is sent by A. CASTOROLI (Austria, 38, p. 1008), who is Honourably Mentioned for a collection of paving blocks and columns of some interest. Messrs. J. SPANNA and Co. (Sardinia, 88, p. 1305) also exhibit paving blocks of artificial marble, and have received the same notice. Both these Exhibitors appear to be manufacturers of a material well adapted for the purposes for which it is intended, and no doubt of sufficiently moderate price when laid down in the country. The prices quoted to the Jury are not sufficiently different from those charged for similar results in England to require special remark on this score.

The GREEK GOVERNMENT are exhibitors of a very fine natural cement of the nature of puzzolana, and consisting of volcanic earth from the Island of Santorin. This material is Honourably Mentioned by the Jury as of known and excellent quality, and capable of being supplied in unlimited quantities at a very moderate price.

There are several other foreign Exhibitors of cement and similar compositions. Mr. E. SKOON, of Esslingen (Wurtemberg, 78, p. 1118) has sent mosaic asphalt tablets constructed on a new plan; and Messrs. MOONAUSSON and KOSSE, of Coblenz (Prussia, 428, p. 1074), some table-slabs of artificial marble inlaid with mosaic work; neither of these call for extended notice. An hydraulic lime is exhibited by Messrs. LEONARD BROTHERS, of Ulm (Wurtemberg, 5, p. 1114), which is described as a quickly-setting, hard, and valuable material, the price being 1s. 6d. English per cwt.

From Austria we have two Exhibitors of artificial punice-stone, Messrs. B. HADENOTH and Co. (35, p. 1008), and Mr. J. SCHARAS (36, p. 1008), and one who sends

artificial stone and marble, Mr. R. ROHLIK (37, p. 1008). The artificial pumice is not without importance in the absence of an abundant and cheap supply of the natural stone, and is understood to be extensively used.

### b. Plasters and Scagliola.

The general composition of the plasters has been already explained, but as the subject is one of importance and very general interest, we may here briefly recapitulate the more essential features of distinction between them and cements. The latter (cements), whether hydraulic or otherwise, easily part with the carbonic acid and water which the cement-stone contains by the mere application of heat, and become reduced to lime, whence, by certain treatment and some admixture, either natural or artificial, but generally by a mixture of silicate of alumina, a material results which more or less rapidly takes up the water required for effecting solidification, and immediately hardens without being affected by external circumstances. The basis of such cement is carbonate of lime. On the other hand, the plasters are composed of a basis of sulphate of lime or gypsum, which being burnt, parts only with its water of solidification without being in any way decomposed. The re-admixture of water reproduces solidification, though in a somewhat altered form, but by adding some of the salts of alumina, borax, and potash in a certain stage of the process, it is found possible to increase the hardness and compactness of the newly-formed stone and modify very greatly its absorbing power. In these admixtures lies the secret and peculiarity of all the various patented plasters known as Parian, Keene's, Martin's, and others.

Messrs. J. B. WHITE and Sons (Class I., 130, and Outside, 10, p. 134 and 114) are extensive Exhibitors of Portland cement, but have added to them samples of various other cements and plasters, some plain, and others highly decorated. They may be considered as more especially the Exhibitors of Portland and Keene's cement, having constructed a beam of bricks, in which the former is used, and the strength of which was tested in the presence of some members of the Jury. Besides these are several panels, chimney-pieces, floorings, and other decorative objects of the latter kind (Keene's). The details of the experiments above alluded to, and some others of the same kind by Messrs. Robins, Aspdin, and Co., will be found in a subsequent page,\* and it need only be said here, that the results were highly favourable to the use of Portland cement, showing it to be of great value for strength, as compared with Roman cement.

The decorative work of Messrs. White is particularly interesting, and is that to which we here chiefly refer. It includes one large panel and a pavement of Keene's cement (gypsum twice burnt and mixed and made up with alum), of extreme hardness, coloured with earthy and metallic oxides, and worked to a high polish. In this state the cement resembles scagliola, possessing even greater brilliancy and depth of colour, but wanting something of the brecciated character which characterises that preparation. Another of the panels on the south wall is executed in French plaster, which being far more abundant and more easily quarried than the English, is much cheaper, but owing to an admixture of carbonate of lime it does not burn to so pure a white. The object of the Exhibitors has been to show that this material is, notwithstanding, quite as well adapted for the finer kinds of work, as it is for stucco on walls and other common purposes.

A number of smaller objects are shown as illustrations of various decorative uses, but it must not be forgotten that the simple and less noticed adaptations to skirtings and other parts of rooms where a very hard durable substance is required, uninjured by damp, and perfectly safe from the attacks of vermin, is a practical result much more important than any other. This is the true value of Keene's and other similar plasters obtained by the admixture of borax, alum, or some other salts of the alkaline earths, with the burnt gypsum in various degrees of purity. A Prize Medal has been awarded to the Messrs. White for their exhibition of Portland and Keene's cement.

Messrs. C. FRANCIS and Son, of Nine Elms (Class XXVII., 47, p. 767), have constructed for the purposes of the Exhibition, a large and handsome screen of Parian cement, representing the various qualities of the material\* and the kind of decoration for which each different quality may be considered best adapted. This cement, like Keene's and Martin's, is very hard, and is valuable for many purposes of house decoration; it also admits of very rapid execution, one of the specimens exhibited having been painted on the same day that the cement was set. The material is very beautiful, so far as fineness of grain and perfect facility of receiving colour are concerned, and it receives a splendid polish, but the white, though pure, is dead and unpleasant in its tone.

The scagliola work in these specimens, executed by Mr. VINCENT BELLMAN, is throughout excellent, the colours which are introduced by the scagliolist imitating verd antique, Sienna and other marbles, jasper, &c.

Besides Parian, Messrs. FRANCIS and Sons exhibit specimens of Medina cement (a modification of Roman) made up with shingle, and producing a substance of great hardness and durability well adapted for garden pavement. The cost of this by the sea-side, where shingle can be readily had, would not exceed 6d. per foot, cube. A Prize Medal is awarded to these exhibitors for their different cements, which they manufacture extensively, and for which they have a high reputation.

Messrs. STEVENS and Son, of 186 Drury Lane (24, p. 765), the patentees and manufacturers of *Martin's cement*, exhibit some excellent and highly-finished decorations of that material on the South Wall. Its peculiarity in relation to other gypsum cements has been already mentioned, and the advantage is considered to be great compactness and extreme hardness. The scagliola work executed upon it produces effects that are very beautiful, and the price is said to be moderate as compared with the other scagliola; but there can, of course, be little difference of cost where the composition is so nearly the same, as is the case with this and the other similar cements. The Jury have adjudged a Prize Medal to these exhibitors.

To Messrs. C. LEE and Co. (28, p. 765) a Prize Medal has been given for an ingenious and cheap imitation of marble in soft and hard cement, invented and manufactured by them. The effect is produced by the waste materials of silk works, or the short cuttings from piled fabrics, as cloth and velvet, mixed with the cement, the whole thus forming a mass having either a uniform colour or a mixture of colours throughout, while the veins are formed by silk threads drawn out to imitate such appearances as may be fancied. A great advantage in point of cheapness is thus obtained, and in some cases a polish can be produced during the laying on of the cement. The material seems adapted for halls, staircases, and other internal work in houses, churches, &c., and can be finished where polish is not required for 3d. per square foot in stucco, and 4d. in hard cement. For polished work 6d. extra would be charged; but when it is remembered that the price of scagliola of the plainest kind is 6s. 6d. per foot, the vast difference in cost will be appreciated, while the durability must be at least equal.

In true scagliola the ordinary colours introduced are apt to be affected by the moist state of the work and the use of alum, so that they often run; while on the other hand, from the nature of the material, consisting of a sort of plaster on a framework of some kind and afterwards polished, there is little means of adaptation to positions where strength is required. It is therefore that the Jury have thought it right to notice a Gothic arch of a new kind of scagliola, invented and exhibited by DENNIS DOLAN, of Manchester (45, p. 766), to whom they award a Prize Medal. This arch includes a clustered column with base and capital cast in one piece, the artisan preparing a mould and pouring into it the outer coat, a marble composition, which is allowed to set before the coarse cement of the interior is added, the latter being so contrived as not to interfere by its expansion with the outer coat, but rather insure the union of the two. This new process of casting scagliola work, and some contrivances in polishing, are noticed by the Jury as worthy of con-

\* See p. 559.   •

sideration. The cost of the articles in the Exhibition would be about 20*l*.

Messrs. ONZI and ARMANI (86, p. 766) are the exhibitors of a material called metallic lava, which is a plaster capable of being worked into a variety of patterns and colours, as illustrated in the Exhibition, and well adapted by its beauty, durability, and cheapness, for floorings and other decorative purposes, amongst which is a table in the Moorish style, intended for the President of the French Republic.

Two different kinds of the metallic lava are exhibited; one of which is white and ornamental, and admits of the application of mosaic work; and the other brown, and peculiarly adapted for covering roofs and terraces, lining tanks, cisterns, fish-ponds, brick walls, stables, &c., where a durable, cheap, and impervious covering is required. Both kinds have stood the test of experience, and are known to be well adapted for the object they are intended for. The composition is patented, and the method of laying down a flooring or terrace without trace of joints is both new and advantageous, insuring the perfect impermeability of the whole to moisture. A Prize Medal is awarded to these exhibitors.

To Messrs. DELLA VALLE BROTHERS, of Leghorn (Tuscany, 120, p. 1300), a Prize Medal has been awarded for a new and peculiar manufacture in scagliola, to a certain extent imitative of works in Florentine mosaic, but applied in cases which would be impossible by that process. The objects exhibited consist of two tables and a vase, all truly inlaid, and having a striking and very brilliant effect. This kind of manufacture differs from ordinary scagliola in the much greater complication of the process, and also in the greater beauty of the result, as the subjects include figures and views which at first appear hardly possible to be executed in such material, but which show great labour and skill, and some artistic knowledge in application. One of the objects, a round table, contains a central tableau, surrounded by an azure zone, with several emblematic ornaments. The table itself is of scagliola on a base of marble, each colour composing the ground, and each figure of the central tableau has been first inlaid in a single piece and then shaded. The lights also are all inlaid, and the general effect is extremely beautiful. It will be seen that the general principle involved is that of a mixture of fine inlaying with shading. It would appear, however, that the result, although beautiful, is almost too costly to be generally adopted, as the price of the round table referred to is stated at 250*l*. The rectangular table in imitation of pietra-serena, and the vase, which is copied from the antique, show several difficulties incident to the process very successfully overcome. The polish in all the specimens is very good, and entirely natural, no varnish whatever being used.

Mr. L. ROMOLI (Class XXX., 351, p. 842, and Tuscany, 124, p. 1300) exhibits a scagliola candelabrum in imitation of giallo antico, designed by ~~Bartholomew~~ Bruner, Esq., modelled by Ant. Trentanove, and the property of His Royal Highness Prince Albert; and also a table in inlaid scagliola, shown in Tuscany. This exhibitor is Honourably Mentioned as exhibiting excellent workmanship in the elegant and costly applications of the material he employs. The candelabrum is not altogether pleasing in its effect, but the workmanship is good. The inlaid table is something in the style of those exhibited by the Messrs. Della Valle, but not at all equal either in design or execution. It appears also to have been manufactured in a somewhat different manner. A cement mosaic in imitation of wood and marble was sent from the Cape of Good Hope for exhibition.

#### c. Artificial Stone with Silica Base.

As constructed in a manner and on principles altogether distinct from those of both lime and gypsum cements, we must next mention an artificial stone recently introduced by Messrs. BARAGG and RAMSON, of Ipswich, and somewhat extensively exhibited in Class XXVII. (87, p. 771-2). This material is a compound consisting of grains of sand, pebbles, portions of limestone, marble or granite, clay, or indeed any other material, cemented together by a true

glass obtained by dissolving flint in caustic alkali in a boiler at a high temperature, mixing up the materials with this solution into a paste of the consistence of putty, moulding this paste into any required form, and after slow air-drying, burning the articles thus manufactured in a kiln at a bright red heat maintained for some time. In the course of this process, the alkali combines with the free silica and forms a kind of glass, so that the materials become cemented together by a substance which does not admit of the smallest absorption of moisture, and is consequently absolutely unattackable by the frost. It also resists every other kind of atmospheric action and is extremely hard. It possesses besides the great advantage of not contracting sensibly during the last process of baking.

It may be well to state briefly the details of manufacture in this case. The flints are used in the rough state in which they are found in the chalk, and of large size. They are suspended in wire baskets in a high-pressure boiler, the pressure being from 60 to 100 lbs. on the square inch. For about a ton or ton and a half of flints, about a quarter of a ton of caustic soda is required (about 56 per cent. of alkali). The resulting substance, a fluid silicate of soda, is drawn off every 48 or 56 hours, the quantity being about 200 gallons, and is afterwards evaporated down to a specific gravity of 1.165, when it is fit for use. The further process is sufficiently described above. Although this kind of artificial stone appears to offer many advantages, it is right to mention one objection to its use which has not yet been obviated, consisting of an efflorescence of some of the salts of soda, greatly disfiguring the appearance of the work.

Besides artificial stone adapted for all kinds of garden work, for paving, and for architectural decoration, it has been found easy to manufacture a porous variety for filter stones which may be made of any size, admirably answer the purposes for which they are intended, and are supplied at extremely small cost. They are cleaned with perfect ease, and may be contrived so as to be applied without a reservoir to filter water, delivered to houses by the system of constant supply. The cost of a filter passing 300 gallons per day would be 50*s*., and small filters are prepared for the use of travellers, the price of which is only 5*s*. Besides these slabs, permanent ascending filters are prepared with the same material, the price of which, complete, varies from 15*s*. to 4*l*., supplying daily from five to sixty gallons: these are especially adapted for ships and domestic purposes. Other very useful articles have been manufactured of the same kind of material, among which scythe-stones and other grindstones may be mentioned. The Jury have awarded a Prize Medal to these exhibitors for the improved material they have introduced, and the applications of it they have already made.

#### d. Bituminous Cements and Mastics.

Another and quite different kind of cement is made chiefly with bitumen. It is now well known both in England and on the Continent, under the name of asphalt.

The pavement laid down at the east entrance of the Exhibition by the SEYMEL ASPHALTE COMPANY is a good sample of their material, and a Prize Medal has been awarded them for this object. The asphalt is generally obtained from natural sources, where it is combined with a large per centage of carbonate of lime, reaching even to 80 per cent. or more, and the combination is so perfect that the rock in this state long resists the action of muriatic acid. Less pure kinds contain sand, which is found to be injurious. The best kinds of asphaltic rock are converted into a plastic workable mastic in a short time, and at very little cost, merely by the addition of 6 or 8 per cent. of mineral or coal-tar and a few pebbles, the union being effected in an iron cauldron at a very moderate heat, and the viscid mass placed on a prepared flat surface. The advantages of this kind of pavement are its extreme toughness and power of resisting very considerable wear. Such a pavement absorbs no water and makes very little dust.

Mr. J. B. DUROU (France, 485, p. 1201) is also the exhibitor of an asphalt adapted for pavement of this kind, as well as of mosaic work of natural stones cemented by asphalt. This use of the material is fully appreciated

by the Jury, and must be extremely valuable. It has, however, been long known, and indeed the application of bitumen dates very far back in the history of civilization, as we find that it was commonly employed by the ancient Egyptians, and formed a solid and durable cement in the walls of Babylon. The Jury award an Honourable Mention to Mr. Dufour for his exhibition.

#### e. *Metallic Sponge Cement.*

A very curious and ingenious contrivance for a pavement is exhibited by Mr. A. CHENOT (France, 119, p. 1177), which, if it can be manufactured at an economical rate, may be of importance under certain circumstances. It is called by the inventor "metallic sponge," and is prepared by reducing certain ores of iron (oxides) into a spongy state by the removal of their oxygen gas. In this condition they readily form into a durable cement. It may be a question whether an invention of this kind, which is not very recent, would not have been brought into active operation before now, had there been no practical difficulties hitherto insuperable; the Jury feel, however, that they are justified in conferring a Prize Medal on Mr. Chenot, in the belief that a new principle has been introduced, and that a most durable material for pavements, &c., is provided by the aid of his contrivance.

#### K. GLASS AND PORCELAIN MOSAICS.

The art of inlaying, when the material inlaid consists of manufactured cement, glass, or porcelain, instead of marble or gems cut into definite forms, is so extremely different in all respects that we have judged it best to describe the processes of the former kind separately, and bring together the exhibitors who have sent such results into a single group. Even this group admits of subdivision, as it includes Roman mosaics, where prisms or threads of glass of various size and shape compose the whole picture; Venetian mosaics, where the glass is a tessera or other squared shape of some size, inlaid often in a cement base; and a third kind, in which the inlaid substance consists of porcelain or burnt clay, generally also in tesserae, and producing results admirably adapted for paving, and for house, palatial, and church decoration.

#### a. *Roman and Venetian Mosaic.*

The manufacture of true Roman mosaic has always, we believe, been confined to the city whence its name is taken, and no country has entered into competition with Rome in exhibiting specimens of it. The Reporter has received the following account of the manufacture from M. Pistrucci, Chairman of the Jury:—

"The mosaics which are made in these times are composed of pieces of glass, sometimes called *smalti* and sometimes *paste*. They are made of all kinds of colours, and every different hue, and for large pictures they take the form of small cakes. For small works they are produced in threads, varying in thickness from that of a piece of string to the finest cotton thread. Heaps of these, of all tints and colours, are prepared. A plate or slab of copper, marble, or slate is then provided, of the size and thickness required for the intended work. This slab is hollowed out so as to resemble the bottom of a box or a tray, to a depth proportioned to the work; this may vary from an inch to the eighth, or even the sixteenth of an inch, if the work is to be small. This hollow is then filled with plaster of Paris, well smoothed, on which the outline of the proposed design is very accurately traced, and an inked pen is passed over the outline to preserve it. Very few tools are required by the workmen; but for the large works, where comparatively large pieces are to be inserted, small sharp-cutting hammers are made use of for splitting the cakes and reducing them to their proper size and form. Pincers also, of different forms, are used for placing them equally. In very small works, instead of hammers, sharp-pointed pincers are made use of, like those with which diamonds are taken up, and sometimes a small tool like a *scarpello*. The heat of an oil lamp is required to enable the workman to draw out the strips of glass to the fineness he wants, even to that of a hair. When this is all ready, the first operation is to dig or scoop out, with a *scarpello* of the proper size, a

small piece of plaster of Paris from the bottom of the box or tray, without injuring the outline. This is filled up with a kind of mastic, like that which is used to fix panes of glass in the sashes or frames of a window, and the required piece of smalt or glass is then pressed into the mastic or composition. In this way, step by step, and from day to day, repeating the operation of scooping out a small piece of plaster of Paris, and never losing sight of the outlines, they gradually fill up the whole tray. In works of considerable dimensions the workmen place the tray or plate before them as painters place the canvas on which they are painting, and have the original always close to them. For smaller works they sit at a table, as if writing, and generally keep their work flat on the table. The designs used in these mosaics are, for the most part, copied from the pictures of some artist of eminence, the designers themselves being also a separate body, working for the *mosaicist*, who mechanically fill up the spaces as above described. It is true, however, that though these last cannot be called artists, nevertheless those who distinguish themselves in the art must be endowed with a good natural taste, a true and correct eye, and great perseverance, to enable them to copy the various tints and forms of the original without injuring the outline. I am not aware that any *mosaicist* has ever worked from his own original design, or even that he has drawn the outline on which he works. When this operation is completed, it is passed over a stone made perfectly smooth and cleaned of every kind of dirt. But as it will always happen that interstices, however minute, will be left more or less between the several small pieces of smalt inserted in the mastic, these are to be carefully filled up with heated wax, applied with hot-iron instruments from a pallet on which it has been prepared for the purpose; and much of the good effect and finish of the work will depend on the ability and care of the workmen by whom this operation is performed."

The Exhibitors of works of Roman mosaic are six in number, and the Council of Chairmen have acceded to the recommendation of the Jury of this Class to give a Council Medal to that one amongst them who has sent the most remarkable specimen of this most beautiful and imperishable art. The artist selected for this high reward is the Cavaliere BARBERI (Rome, 15, p. 1286), and the object he exhibits is a large round table, designed and executed by him, or under his superintendence, and representing celebrated views in Italy. Without comparing this with other celebrated mosaics, not exhibited, the Jury have been exceedingly struck with the singular beauty and beauty of the workmanship, the admirable adaptability of the material to the nature of the work and the style of design, the exquisite shading of the colours, and the brilliant though softened effect of the group of views, the atmosphere and sky of each mingling into the same ethereal tint, which relieves the eye, and allows it to rest with pleasure on the separate views.

Of the other mosaics, two of very different kind have been sent from the ROYAL MANUFACTURE AT ST. PETER'S (Rome, 23, p. 1286), one of them being a copy of a celebrated picture by Guercino (a St. John Baptist), and the other a medallion, the portrait of Pope Boniface the Second. Both of these are of much larger pieces than the table, being intended for more distant vision, the latter especially, which appears meant for a lofty position in a church; but both are remarkably fine specimens of workmanship, and the colours and drawing are perfect. A Prize Medal is awarded to the exhibitor of these objects. (Prize Medal granted by Class XXX. also.)

To the Cavaliere LUIGI MOGLIA (Rome, 20, p. 1286), a Prize Medal is also adjudged, for a circular table, a square slab, and a picture presenting a view of Pæstum, all in Roman mosaic, and all admirably executed. The other exhibitors of similar objects, viz., BENEDETTO BOSCHETTI (Rome, 17, p. 1286), artist; DOMENICO MOGLIA (Rome, 21, p. 1286), and ANTONIO BOGGHIGLIANNI (Rome, 22, p. 1286), are Honourably Mentioned, as having shown admirable specimens of the same curious art; and to the former a Prize Medal has been awarded.

It is right to mention that since the opening of the Exhibition, and indeed since the investigations of the

Jury have been completed, several objects in Roman mosaic have been added, which are chiefly of small size, but which deserve high commendation for their beauty. Several members of the Jury having left town, it has been impossible to reward in any formal manner the exhibitors of these, although they well deserve to be mentioned with the others.

A group of objects is exhibited in a new kind of glass mosaic, by Mr. G. H. STEVENS (Class XXX., 158, p. 830), executed at about one-third the price of the ancient manufacture of this kind. These objects include a pair of spiral candelabra, made in Keene's cement, in imitation of marble, inlaid with various patterns of glass mosaic, and intended for the decoration of a hall or drawing-room. The glass is in large tesserae. There are also glass mosaic tables, a slab containing various patterns for panels, and a specimen of heraldic decoration. The glass is staked or gilt, and the method is adapted for many purposes. The Jury have thought the method worthy of Honourable Mention.

#### b. Clay and Porcelain Mosaics.

No Exhibitors can at all compete with Messrs. MINTON (86, p. 770) for the variety, beauty, and excellence of the encaustic and mosaic tiles manufactured by them by a process which involves very great mechanical ingenuity, and which has been carried to a very high pitch of perfection. Messrs. Minton have, indeed, to some extent, followed in the track of similar manufactures among the ancients, both with regard to the uses, forms, and patterns of their tiles, for paving and walls; but they have very greatly improved all the mechanical contrivances, introducing one method more especially—enormous compression to consolidate dry clay—which deserves very distinguished notice, and has been the commencement of an entirely new era in mosaic work in plastic material. To Messrs. Minton, accordingly, the Jury recommended a Council Medal, and the award was recognised by the assembled Group of Juries, and sent to the Council of Chairmen for confirmation. These Exhibitors had also received the same honour for their manufactures in porcelain generally, and there is thus a joint Council Medal given from Classes XXV. and XXVII.

The tiles exhibited by Messrs. Minton are of three kinds, viz. :—

1. *Encaustic, or, Inlaid Tiles.*—These are made by pressing clay in the plastic state into an embossed plaster mould, the pattern or design on the mould being raised. When the clay is withdrawn from the mould, the outline of the pattern is indented; and the indented parts are then filled in with liquid coloured clays, according to the colours it is wished to produce. The surface is then scraped quite flat, until the pattern appears well defined. The tile is then fired, which brings out the colours to the proper tint.

2. *Venetian Tiles and Mosaic.*—These tiles are produced by the compression of powdered clays in metal dies, of any geometrical form that may be desired; the clays having been previously stained with metallic colours. Each tile or tessera is, of course, of the same colour throughout. When fired, they are arranged on a smooth platform with the face downwards, according to the design intended; after which liquid Roman or Portland cement is poured upon them, and they are thus formed into slabs of any size required.

3. *Tiles made after the manner of the Alhambra, and other Spanish Tiles.*—There is only one example of these tiles in England, and that is in the Mayor's Chapel at Bristol, supposed to have been presented to a predecessor in the civic chair by a Spanish merchant. These are made by pressing plastic clays on an embossed mould, which forms grooves or indentations. These tiles are then fired, and come out of the oven with the pattern formed. The indentations are then filled in with enamels of various colours, and fired again, which produces a brilliant effect, and renders the tiles suitable either for floors or casing walls.

To Messrs. ALFRED SUTTON and Co., of the Vauxhall Pottery (83, p. 742), a Prize Medal has been awarded for a mosaic pavement composed of tesserae of vitrified

clay of several colours and shapes, all produced by machinery with great rapidity and facility, and without the necessity of chipping any of the tesserae. The machine is patented by the Exhibitors; and, besides making tesserae of the usual form and size, is capable of subdividing them in such a way that, with comparatively few shapes, an endless variety of patterns can be executed, the joints being preserved in straight lines throughout the whole pavement.

The mode of working is as follows:—The clay being prepared in the usual way, by washing and sifting, and stained with various metallic oxides, is formed by a machine into long thin ribbands, about  $\frac{1}{8}$  inch thick, and 3 or 4 feet long. Out of these ribbands the tesserae are cut by the patented machine with great rapidity, and when dry are baked in saggers in the usual way.

The pavement slabs are made by laying these tesserae face downwards on a perfectly flat slate, the pattern being of course reversed, and covering their backs with a layer of Portland cement and two layers of rough thin tiles, carefully embedded in the cement. In this way strong slabs are formed, of about  $1\frac{1}{2}$  or 2 inches thick, which are almost perfectly impervious to moisture or rising damp, and can be laid down by any mason.

The exhibitors consider that they may fairly claim merit for the introduction of the method, and the flatness and durability of the surface, as well as its imperviousness. The work can be produced at from 2s. 6d. to 5s. per square foot, according to the size of the pavement and that of the tesserae. The specimen in the Exhibition is valued at 3s. 6d. per square foot.

MESSRS. MARCHESI and OSSOLI (Rome, 13, p. 1285) are exhibitors of a number of slabs of cement, of very good quality, prepared for pavement, and imitative of marble mosaic. They have received Honourable Mention for these objects.

#### Group 4.—MANUFACTURES IN CLAY.

The number of objects exhibited belonging to this group is considerable, and of great importance. The number of exhibitors is not, however very large, amounting only to between eighty and ninety, of whom nearly forty are foreigners.

Of the English exhibitors there are some remarkable for excellence of various kinds, but especially in fire-clay goods, terra-cotta, salt-glazed ware, tiles, drainage-pipes and bricks. Of each of these there are several.

France has as many as twelve exhibitors sending terra cottas of great beauty, and some fire-clay goods.

Belgium has only four, and all of fire-clay goods, consisting of retorts and crucibles. Of the various States of the Zollverein there are four from Saxony, and one from Bavaria, almost all of chemical apparatus; besides four from other countries, of brick and terra-cotta. Austria has only one, but a very important exhibitor in bricks. Italy has also only one, who sends a clay mosaic pavement. From the Peninsula there are four; two of them sending samples of the large jars for which Spain and Portugal have long been famous. From India are several specimens of bricks and terra-cotta; and from the United States are a few objects of some interest.

#### L. BRICKS AND TILES.

Among the materials used for construction none are more really important than bricks, these articles being manufactured of a substance almost universally attainable, worked into a form convenient for use, hardened and rendered more or less impervious to moisture by a partial burning, and when used, cemented together with mortar, or some of those substances described in the first group of plastic materials. Bricks have been employed from the earliest period, and are still as necessary, if not more so, than ever; and, whether in the form of common stock bricks, or any modification for building purposes, or as flat or other bricks for roofing or paving; or lastly, as gutters or pipes for drainage, the number used is so large, and the interest concerned so universal, that even the smallest improvement, either in the mixture of material, the method of burning, the method of unloading, or indeed any other matter, is of really national importance.

The facts with regard to bricks have reference to the kind of clay used; the admixture of clay with other material; the size, shape, and proportions of the brick, tile, or pipe; the mode and extent of burning; the production of any glaze or other peculiar surface; and lastly, the mode of using them and attaching them together. It will be found that several contrivances, more or less ingenious, and more or less complete and efficacious, have been submitted for exhibition, and have come under the consideration of the Jury, and the Reporter regrets that this subject, the interest and extent of which he fully recognises, should have been left to him to describe and dilate upon, sensible as he is that the want of professional and practical acquaintance with the arts of construction must seriously interfere with the due execution of his task.

In speaking of the exhibitors of these articles, it will be convenient to consider them grouped, as far as possible, in regular order. We propose to treat them as follows, although it may sometimes be necessary to depart from this plan on account of single exhibitors sending objects of different kinds:—

1. General improvements in building contrivances, such as hollow bricks, glazed bricks, &c.
2. New and peculiar forms of bricks and ornamental bricks.
3. Common, waterproof, and white bricks.
4. Roofing and paving tiles.
5. Drain-pipes, &c.
6. Bath or scouring bricks.

We have mentioned in the commencement of this Report that a Council Medal had been awarded to the SOCIETY FOR IMPROVING THE CONDITION OF THE LABOURING CLASSES (pp. 774-5), for their improvements in the arts of construction as applied to dwelling-houses, and especially to those of the lower classes. Those only who have visited the dwellings of the labouring population, as at present constructed in large towns, are at all aware of the overwhelming necessity for some great and rapid improvement, and of the vast alteration that might be effected in the moral condition as well as the health of the poor, if the decencies of life were attended to in their habitations. By introducing a system of construction remarkable at once for strength, cleanliness, warmth, ventilation, dryness, rapidity of completion, safety from fire, and economy, this Society have established claims deserving of the highest acknowledgment, and have insured the gratitude of multitudes who have not yet learned the advantages they will derive. The contrivances include a peculiar form of brick, made tubular; moulded articles in clay for window-sills, mullions, &c., soil and other drains, earthenware water-closets, &c., besides kitchen-ranges, iron bedsteads, &c., which do not come under the consideration of the Jury. Many of these are illustrated, not only in the Exhibition (Class XXVII., 124, pp. 774-5), but in the lodging-houses constructed by H.R.H. the Prince Albert, opposite the Exhibition Building in Hyde Park; but it is well to state that the cost of these cottages need not by any means be taken as a model for similar constructions elsewhere, and that, on the contrary, the houses that have been actually erected show a sufficient return for the capital invested, and even at very moderate rents promise to prove profitable in a strictly commercial sense.

Of all these contrivances the Society appear to put forward the principle of tubular bricks as of first importance. It is true that the idea is by no means modern, similar materials having been employed by the Romans when lightness was needed, as in large vaultings, and being described as of common use at this day in Tunis, and other parts of North Africa, where they have indeed been employed for many ages. Bricks of this kind, of somewhat peculiar construction, have been patented by H. Roberts, Esq., F.S.A., the Honorary Architect of the Society, and have been illustrated by the Society in the Exhibition, the one kind made wedge-shaped (the value of which form is doubtful), and bonded longitudinally over each other, so that two cavities run parallel through every course, giving a double security against moisture, and much facility for ventilation. We quote the following

from a paper published by the Society, and distributed by them:—

The dimensions being unlimited, a size has been chosen which, with the omission of the headers, reduces, by about one-third, the number of joints, and greatly improves the appearance of the work, giving it more boldness of effect and resemblance to stone than that of ordinary brickwork. This size is twelve inches long, and three courses rise one foot in height; a size equally convenient for the workmen in the manufacture, and in the use of the bricks, for, whilst less liable to damage in moving than those of larger size, their form admits of ready handling and stowage for transport.

Nine patent hollow bricks of the size before described will do as much walling as sixteen of the common sort, whilst the weight of the former but little exceeds that of the latter, an important consideration in reference to carriage as well as the labour in using.

When passing through the machine, or in the process of drying, any number may be readily employed at the ends for gables, or marked for closured, and broken off as required in use; or they may be perforated for the purpose of ventilation. If nicked with a sharp-pointed hammer, they will break off at any desired line; and the angles may be taken off with a trowel as readily as those of the common make.

A sufficient proportion of good facing bricks may be selected from an ordinary burning, and in laying them a much better bond will be obtained than is usually given in common brickwork.

The bricks for the quoins and jambs may be made either solid or perforated, and with perpendicular holes, either circular, square, or octagonal: those in the quoins may be so arranged as to serve for ventilating shafts. Stone will be found equally applicable for the quoins and jambs, and the appearance of the work be thereby improved.

Hollow bricks may be made with any good tile machine, in the same manner as ordinary draining pipes, and at about the same cost, in proportion to the quantity of clay contained in them. They are more compressed, require less drying, and with much less fuel are better burned than ordinary bricks, even when only waste heat, or that in the upper part of the kiln, is used.

The saving in brickwork effected by the use of the patent bricks, when made at a fair price, will be from 25 to 30 per cent. on their cost, with a reduction of 25 per cent. on the quantity of mortar, and a similar saving on the labour, when done by accustomed workmen. The process of drying is much more rapid than in common brickwork, and the smoothness of the internal surface of walls built with the patent bonded bricks renders plastering, in many instances, quite unnecessary, whereby a further saving is effected, not only in the first cost, but also in the subsequent maintenance. If glazed on the outer face, as may be done with many clays, a superior finished surface is obtainable without plaster.

STATEMENT showing the Comparative Cost of a Rod of Reduced Brickwork, built with ordinary Bricks of the common size, and a Rod built with Patent Bonded Hollow Bricks:—

|   | £. | s. | d. |
|---|----|----|----|
| 4,800 ordinary bricks to a rod, at . . . . .    | 4  | 6  | 0  |
| 2,450 Patent Bonded H. Bricks, „ 25s. . . . .   | 3  | 1  | 3  |
| Saving in bricks per rod . . . . .              | £1 | 4  | 9  |
| 2,800 ordinary bricks to a rod, at 2s. . . . .  | 5  | 8  | 3  |
| 2,450 Patent Bonded H. Bricks, „ 30s. . . . .   | 3  | 13 | 6  |
| Saving in bricks per rod . . . . .              | £1 | 9  | 9  |
| 4,800 ordinary bricks to a rod, at 28s. . . . . | 6  | 0  | 5  |
| 2,450 Patent Bonded H. Bricks, „ 35s. . . . .   | 4  | 5  | 9  |
| Saving in bricks per rod . . . . .              | £1 | 14 | 8  |

This shows an advantage of 29 per cent. in favour of the patent bonded hollow bricks, in addition to a considerable diminution in the cost of cartage or transport, and of 25 per cent. on the mortar and the labour.

The relative prices given above may be taken as the fair average selling prices, depending on the cost of fuel, labour in preparing the clay, &c.; and the result of inquiries of parties who have made these bricks in Huntingdonshire, Wiltshire, and Lancashire fully confirms the statement that 30s. per 1000 may be considered as a fair average selling price. Owing to their larger dimensions, this corresponds to 16s. 10½d. for the common sort, or if sold at 32s. this is equivalent to common bricks at 18s. The extra cost for glaze is not stated.

In concluding this notice of the contrivance here referred to, the Jury are desirous to place it distinctly on record, that the Council Medal is awarded to the Society for their exhibition generally, as exemplifying their efforts in various ways to improve the dwellings of the labouring classes, and not for any particular part of it.

A very ingenious machine exhibited by Messrs. BORRE BROTHERS (France, 417, p. 1198) is well adapted for the manufacture of tubular bricks of the best quality, with considerable rapidity, and of perfectly uniform dimensions. In this machine the clay is greatly compressed, and when burnt the bricks are extremely hard and strong. It is said to be capable of making 4000 of ordinary size per day; but the size exhibited is very large, and there are as many as nine small tubes running longitudinally through each. The bricks can thus be made extremely light, the saving in weight being estimated at 50 per cent., but capable of reaching 70, while the saving in expense is stated at from 10 to 30 per cent. A Prize Medal is awarded to the exhibitor.

Other hollow bricks, manufactured in the ordinary way, and without statement of price, are exhibited by the North Devon Pottery Company (Class I., 127, p. 133), but these do not offer any marked peculiarity.

Bricks of rhomboidal form are exhibited by Mr. J. C. HADDAN (Class XXVII., 114, p. 773), and have been considered by the Jury as worthy of Honourable Mention. They are considered to offer a means of producing a better bond than can be obtained with the ordinary shape, but it will doubtless be very long before the form and proportions which have so long been used in the manufacture of bricks will be changed, or in any way modified for ordinary purposes. It may, however, happen that for special purposes a change will become advisable, and any ingenious attempt which possesses the great qualifications of cheapness and comparative simplicity is worthy of notice.

Other bricks of new form are shown by Mr. A. MILCH (Prussia, p. 1048), who is considered worthy of Honourable Mention, and by Mr. R. HEGWICK (Class XXVII., 106, p. 772).

Moulded bricks are exhibited by Mr. L. THOMPSON (100, p. 779), and Mr. E. S. KEY (126, p. 776). The latter are adapted for window frames of cottages, school-rooms, &c., not being liable to decay, and being perfectly fire-proof. They are also cheap, the cost per foot super. being stated

at 1s. for red, and 1s. 4d. for white brick, including whole panes of sheet glass, but exclusive of carriage.

A number of specimens of ornamental bricks are exhibited from England, some of them worthy of special notice. Among these Lord LOVELL is Honourably Mentioned for a stack of three chimneys, constructed for and exhibited by him (87, p. 770). The form and style of these chimneys are better than the execution.

Mr. J. LUFF (111, p. 772) has received Honourable Mention for moulded bricks, both plain and ornamental, besides red and white paving tiles, and kiln tiles for malting. The ornamental bricks are described as very economical, the number required for a chimney 10 feet high from the base costing not more than 30s., made to any pattern. The plain tiles and pantiles are capable of resisting the weather, and form a cheap and durable covering for cottages. The collection exhibited is small, but very creditable.

Mr. J. AMBROSE (128, p. 776), is the exhibitor of a white ornamental chimney, also adjudged worthy of Honourable Mention. The form and construction of the bricks employed are very creditable to the exhibitor.

We come now to the consideration of good common bricks, and the Jury have to mention, as occupying the first place amongst these, the series exhibited by Mr. MIESBACH (Austria, 610, p. 1038), of Vienna, the founder and proprietor of one of the largest and most remarkable establishments for brick-making that exists in the whole world. A Prize Medal is awarded to this exhibitor.

As some illustration of the magnitude of this establishment and the good quality of the bricks, we may state that it formed a part of the contract for the great tunnel through the Sömmerring, on the Austrian railway, that 20,000,000 of bricks required this year (1851) should be supplied from Mr. Miesbach's works, and that another contract for 40,000,000 for public works at Vienna is also supplied from the same works during the same year. These are all additions to the ordinary make, and the fact is certified by a member of the Jury, an architect of Vienna. The subjoined statement of the nature of their establishment has been forwarded by the exhibitors to the Jury, and is given here as interesting and instructive.

The privileged brick and tile factory on the Wiener-Berg stands on a space of ground of 264½ English acres, while an area of 680 English acres afford a supply of excellent material for brick-making, sufficient for several centuries to come, and consist of four sections, which are separated into ten subdivisions. There are 24,930 feet in length of drying sheds for the manufacture of ordinary bricks, and 8,304 feet of moulding sheds for the manufacture of tiles, and facing and ornamental bricks, besides 43 kilns calculated to burn 45,000 to 110,000 bricks per kiln, or to burn at one time 3,500,000. There are further in this establishment, infant schools for 120 children, a hospital with 52 beds, besides a tool workshop, a wheelwright's and carpenter's shop, and the great watering

and kneading pits for red and white ornamental bricks. On all the sections there are the requisite dwellings for the officials and workmen, besides stabling for about 300 horses. The six other factories are provided in the same proportion, and the amount of money turned over in the business amounts to about 1,800,000 florins c. m. (180,000*l.* sterling), the capital employed being 600,000 florins c. m. (60,000*l.*)

The ordinary dimensions of the bricks constructed by these exhibitors are double the usual size, measuring 11·3 by 5·9 and 2·8 inches, instead of 9 inches by 4½ and 2½, and they are said to be generally cheaper than stock bricks of the best quality in other countries, notwithstanding the high cost of fuel. They are burnt partly with coal and partly with lignite, obtained from numerous and extensive mines in various districts belonging to the same proprietors.

There are one or two exhibitors of improved common bricks, and some others who have sent similar articles chiefly as illustrations of raw material. Of these we only mention (as being exhibited in Class XXVII.) Messrs. FORDHAM and SONS (118, p. 773), and Mr. F. FISHER (Class I., 119, p. 133), the former of whom send improved, and the latter white bricks.

Excellent bricks of the common kind used in the country are amongst the objects exhibited from India, but they offer nothing peculiar that requires notice here.

A Prize Medal has been awarded to Mr. J. WORKMAN (116, p. 773) for an ingenious and apparently effectual method of rendering common bricks perfectly water-proof, at a cost of about 6*s.* per thousand. The machine by which the process is effected is sufficient to turn out from 30,000 to 50,000 per day, and the waterproofing takes place either during the first process of manufacture, or after the brick is completed. No extra cost of carriage is needed to complete the work under any circumstances.

It is unnecessary to point out all the advantages that would result from taking advantage of this method, but the Reporter would not omit to notice its peculiar importance in the case of cottages and small houses, and for vaults and foundations. It is in these applications that the very great absorbency of common bricks (which will take up on an average nearly a quart of water each) is so ruinous not only to the property exposed under their shelter, but to the health of the inhabitants, who are often very ill supplied with the means of removing the evil. The inventor believes that the total extra cost of using his bricks would not exceed 4*l.* in the construction of a small cottage.

The manufacture of paving tiles, roofing tiles, and draining tiles, including also drain pipes and pantiles, is so far distinct from that of bricks in the ordinary acceptation of the term, that they admit of separate reference in this place, and many of them are more properly considered amongst agricultural implements. We have, however, a few remarks to offer concerning some few of the various exhibitors who have sent articles of this kind.

To Mr. THOMAS PEAKE, of Tunstall, Staffordshire (123, p. 774), a Prize Medal is awarded for a large and interesting series of articles manufactured in a peculiar preparation of clay, and with a peculiar burning, and called by him *Terro-metallic*. To produce this material several clays are mixed, and some of them being hard they are pulverised by rollers, and tempered in improved pug-mills, the whole being worked by no less than five steam-engines (one of them 50-horse power), and machinery of various kinds in several large factories. At the present time about 30 ovens are employed, and as much as 50 acres of land are in connection with the tileries. The establishment of this exhibitor is of very long standing in Staffordshire, and the prices at which the goods are supplied have been of late years very much reduced. The colour as well as quality of the *terro-metallic* is extremely good for many purposes, some of it being almost like cast-iron, and very strong testimonials have been given by many practical men in favour of the excellence and durability of the manufactured articles. It is stated that the heat at which the material is fired is so considerable as to insure in every case perfect hardness

and soundness, and it also produces a natural glaze of considerable value.

Messrs. H. and R. HAYWOOD, of the Brownhills Tileries, near Burdlem, in Staffordshire (127, p. 776), are exhibitors of tiles of all kinds, quarries, stoneware pipes, closet-pans, traps, and other objects of very fine quality, and are considered worthy of a Prize Medal. Messrs. Haywood not only exhibit a very extensive series of these articles, which are largely supplied and much esteemed in the trade, but they have also added chimney shafts and pavements of the same material. Their clay is of excellent quality, and very well and perfectly worked, and the firing seems to have been effected at a high temperature.

To Mr. ROBERT BROWN, of Surbiton Hill, Surrey (117, p. 773), a Prize Medal is awarded for improved Italian tiles, and grooved ridge tiles, invented and exhibited by him.

Until this exhibitor introduced his modification of Italian tiles, those made in England, as well as those brought from the Continent, were all adapted to the English climate, and therefore little used, but by the alteration he made in the form, the exact appearance of the Italian tile is preserved, while the roof is perfectly water-tight. The lower tile being slightly curved, and a horizontal indentation made across its face, about one inch from the top, besides a button being placed instead of the nail-holes used in the old Italian tile, the needful alterations are made, and the tile is complete. The tiles are coloured grey, the colour being burnt in. The cost of these tiles is more moderate than that of any other Italian tiles used in England.

The grooved-ridge tile is so contrived that the vertical ornaments can be made separately, at low cost, and with great accuracy, and can be replaced if broken. The Jury consider both this and the former modification as of great merit, and have reason to believe that they are fully sanctioned by experience under various circumstances of exposure.

A Prize Medal has been awarded to Mr. AMULLER (France, 405, p. 1197) for a new kind of tile introduced by him, exhibiting much ingenuity of design, besides great neatness and excellence of execution. Mr. Fox (France, 1232, p. 1236) is adjudged worthy of Honourable Mention for other tiles, of brick, clay, and glass, exhibited by him. The tiles of the former exhibitor are apparently well adapted for general use, unless their cost should be more considerable than that of the more common kinds, nearly equal to them in decoration, and durability.

Mr. SEALY, of Bridgwater (130, p. 776), an exhibitor of roofing-tiles and Bath bricks, is Honourably Mentioned, chiefly for the latter articles. The scouring bricks, so called, were first brought into general notice by the house which he now represents, and he is still the principal manufacturer and exporter of the article, which is of great use for various purposes in the arts. The following account of the Bath bricks will be found to possess some interest, and is supplied by this exhibitor. It is probable that the finest silicious particles are derived from the destruction of infusorial animalcules at the meeting of the tide with the fresh water of the river, and it is not unlikely that a somewhat similar if not identical product might be obtained from the mud accumulating at the mouth of the Elbe and other rivers where such causes are known to act.

"The material used for cleaning and polishing metal goods, &c., known by the name of *Bath brick*, is manufactured at Bridgwater from the tidal deposit of the river Parret; and although many attempts have been made to produce a similar article, we believe they have all hitherto failed. This material is a peculiar mixture of fine silicious sand and clay brought up by the tide, which is very strong in the Parret, and is deposited on the sides of the river's banks as the water becomes still, just before the time of its ebbing, and some little time afterwards."

There are several exhibitors of draining-pipes and tiles, some of whom, sending also terra-cotta and glazed stoneware, will be referred to afterwards in this Report; others, sending them rather as illustrations of machines

than manufactures, do not properly enter into competition, and others again, already noticed, have been more remarkable for other more prominent, although perhaps not more really important objects. We must, however, refer here to one exhibitor who has been adjudged worthy of Honourable Mention by the Jury, and whose products are extremely remarkable for the unusual beauty and purity of the material of which the pipes and tiles are manufactured. We allude to the Earl of ENNISKILLEN (Class I., 116, p. 133, and Class IX., 232, p. 395), and quote the following account of the Florence Court Tile and Pottery Works as forwarded to the Reporter:—

"The raw material, of which these objects are manufactured, consists of a patch of about 20 Irish acres, and is only a portion of a very extensive seam of clay, bounded on three sides by a very large extent of excellent peat, or turf bog, producing an incalculable supply of fuel to the works at a cheap rate. The depth of the clay bed averages about 13 feet, of which the upper strata burning red measures about four feet, and is workable to within a few inches of the surface, the other nine feet improves in pureness, and burns whiter as it reaches the bottom.

"The qualities of this clay were partly discovered in 1847, and the manufacture of tiles commenced in 1848. In 1850 it was found necessary to increase the works, and erect two new kilns on a larger scale, to enable the manager to turn out a fresh weekly supply of pipes.

"The drying shed is 180 feet long, by 20 wide in the clear, and capable of containing in its drying compartments 50,000 two-inch pipes, with two wooden tramways running the whole length to accommodate the machines to the shelves, with a wide crossing in centre, close to the rear of which the pug-mill, worked by two horses, is situated. Another range of drying sheds is now being laid out for erection, and the demand from this manufactory extends from Cork to Belfast. A pottery on a moderate scale has been established here a few months, and promises fairly for flower-pots, milk-pans, butter-crocks, jars, black and brown tea-pots, &c."

It may be well to observe, that there is no other fuel than peat used in any portion of this manufacture.

Mr. C. PHILLIPS, of Weston-super-Mare (Outside, West, 63, p. 117), has sent for exhibition a collection of flower-pots, of very admirable manufacture, and remarkable both for colour, smoothness, and style. The Jury have considered Mr. Phillips worthy of Honourable Mention for these articles.

#### M. TERRA-COTTAS.

The manufacture of terra-cotta is an important and interesting modification of common moulded brickwork, requiring a clay of great purity, resembling that used for pipe-making and potter's-ware, containing but little iron, and made up with a quantity of crushed pottery and calcined flints, the whole being well mixed and burnt to a very high heat. It thus approaches in its nature to what is called stoneware, but the fusion of the materials is not effected. There are several exhibitors of terra-cotta of very high merit, and we proceed to enumerate them. It should be observed that the true terra-cotta of the ancients was a less baked and much less durable material than the modern kind, being, in fact, little more than sun-baked clay of considerable purity.

Of English exhibitors of terra-cotta, the most remarkable in respect to the magnitude of the objects exhibited are Messrs. E. P. WILLOCK and Co., of the Ladyshore Terra-cotta Works, Manchester (8, p. 764, and Nave, West, 223, p. 853), to whom a Prize Medal has been awarded. A complete model of a decorated Gothic church, executed entirely in Ladyshore terra-cotta (the whole of the church as well as the model being of this material), forms a very interesting and prominent portion of the Exhibition, and besides this are shown a Corinthian capital, a chimney-piece painted in imitation of oak, with the slab in stone, a flower-stand, a piece of Gothic tracery, and other smaller articles, all illustrating the uses and advantages of the material.

It is stated by the exhibitors that these objects are supplied at a reduction of from 50 to 75 per cent. on the price of carved stone or oak. The quality of the material

is good, and the style of manufacture careful and praiseworthy. The Jury recognise the importance of introducing a material so useful and so economical in many cases, especially where the absence of durable stone interferes with the construction of public buildings. A well-made terra-cotta may be regarded as almost indestructible by ordinary exposure, and although in colour it is generally inferior to good stone, and the parts are liable to warp in burning, yet for some kinds of ornament, and for many practical purposes, the result is everything that is needed.

A Prize Medal has also been awarded to Mr. BLANCHARD, of King Edward Street, Westminster Road, London (92, p. 771), for several objects in terra-cotta, exhibited by him, including part of a Gothic pinnacle, a capital, and some small articles. These are of very excellent colour, and the details of construction are admirable. The material is described as a composition of the best white pipe-clay, crushed pottery ware, calcined flint, flour-glass, and white sand, all well amalgamated and burnt at a high temperature. The tint is exactly that of the material as it leaves the kiln, without artificial colour, wash, paint, or stopping, and is extremely uniform. It does not alter on exposure, and the works of this establishment have stood the test of time.

Mr. PULHAM, of Broxbourne (108, p. 772, and Class XXX., 216, p. 833), is the exhibitor of several objects in red terra-cotta, some adapted for construction and others entirely ornamental. As far as material is concerned these are considered by the Jury to be worthy of a Prize Medal, while the artistic merit of the more ornamental articles is equally noticeable. The colour of some of this terra-cotta is very dark rich red.

Messrs. DOULTON and WATTS, of Lambeth, are exhibitors of sundry objects in terra-cotta and fire-clay, some of them of considerable beauty, and they exhibit, together with Messrs. HENRY DOULTON and Co., also of Lambeth, a number of excellent articles in stoneware (23, p. 765, and 95, p. 771). Both these parties are proprietors of extensive works at Lambeth, where they carry on the manufacture of stoneware on a large scale, to which they have recently added that of terra-cotta, of which alone we speak in the present notice. The terra-cottas they exhibit include vases of large size, trusses, window-heads, and Ward's cases, the latter very beautifully and delicately constructed, though of small size. They also include a full-sized figure of Time (by Messrs. Doulton and Watts), made in one single piece of clay and fired entire without joint of any kind. The chief expense of such figures is incurred in the first moulding, and should there be a demand they could afterwards be repeated at small cost, not exceeding in this case 10*l.* or 12*l.* They are absolutely imperishable by weather. A Prize Medal has been awarded to Messrs. Doulton and Co., and Messrs. Doulton and Watts, jointly, for their combined exhibition of terra-cotta and stoneware, the latter of which will be referred to subsequently.

To Messrs. FERGUSON, MILLER, and Co. (93, p. 771), a Prize Medal has been awarded for sundry goods in terra-cotta, manufactured by them of fire-clay, and burnt at a high heat. The fire-clays found in various parts of the coal measures are now much used for different purposes where refractory clay is required, and amongst the rest for ornamental vases, and figures for outside decoration in gardens, for which they form a good artificial stone, much superior to common stone. The contraction that takes place in firing renders it somewhat difficult to model them with sufficient accuracy to insure a satisfactory result, and this is especially the case where the form required is complicated and cut up into detail. The present exhibitors have prepared some vases expressly for the Exhibition, and they have shown ingenuity in adapting the design to the material.

THE GRANGEMOUTH COAL COMPANY (99, p. 773) exhibit a somewhat similar series to those just described. All the articles forwarded were manufactured from a fire-clay of remarkable purity, consisting of about 64 per cent. silica, and 34½ per cent. alumina, with less than 1½ per cent. of iron, lime, and phosphates. The analysis of the clays used by these exhibitors, as given by them to the

Reporter, rather shows a different combination from that of the Stourbridge clay, but the extremely small percentage of such impurities as render the clay fusible must be regarded as an important peculiarity. The vases, pedestals, and chimney cans exhibited are all of the natural colour of the clay when burnt, none of them having been painted or otherwise coloured. The exhibitors are adjudged worthy of Honourable Mention.

The following is an analysis of the clays of two different kinds used by the exhibitors. The analyses were made by Dr. Penny, of the Andersonian University, Glasgow:

|                   | No. 1. | No. 2. |
|-------------------|--------|--------|
| Silica - - - -    | 65.20  | 62.85  |
| Alumina - - - -   | 33.41  | 35.65  |
| Lime - - - -      | .32    | .45    |
| Magnesia - - - -  | .13    | .15    |
| Oxide of iron - - | .49    | .59    |
| Phosphates - - -  | .45    | .31    |
|                   | 100.00 | 100.00 |

A very beautiful vase in terra-cotta, exhibited by Mr. BETTS in the West Nave, but designed by Mr. J. THOMAS (22, p. 765), is considered worthy of Honourable Mention for the excellence of its form, the colour and quality of the material, and the finish of the work. Some other objects in terra-cotta are shown by Mr. BETTS, of less ornamental character, but of equally good material.

An elegant but small vase, of dark red terra-cotta is exhibited in Class I. (106, p. 132) by Mr. BURNETT, and is Honourably Noticed by the Jury for the smoothness of its texture and the uniformity of its tint, as well as for its form.

There are several other English exhibitors of terra-cottas and fire-clays. Of these we may first mention the GARNKIRK COMPANY (98, p. 772), who have sent a fountain and several vases in fire-clay, besides some samples of salt-glazed ware. The material appears to be of fair quality and carefully worked. Messrs. J. BELL and Co. (96, p. 771), have sent vases manufactured of their excellent fire-clay, which, though not very remarkable in other respects, show the quality of the material to great advantage. In Class I. (108, p. 132) are a statue and some small objects in terra-cotta, exhibited by Mr. GRIMSEY, of Oxford, the designs being deserving of notice; and in the same Class, exhibited on the South Wall (86, p. 130), is a small group in relief, manufactured of fire-clay, and sent by the BANK PARK PYROPOLITE WORKS. Some other objects in terra-cotta are exhibited from England, but they are of comparatively small importance, or are sent rather as illustrations of material than as mineral manufactures.

From France there have been sent several objects in terra-cotta, some of them extremely remarkable, not only for beauty of material, but for taste and elegance of design, and an amount of skill in manufacture which does the highest credit to every one concerned. Of the various exhibitors the Jury have felt no difficulty in awarding a Prize Medal to Messrs. VIREBENT BROTHERS, of Toulouse (France 732, p. 1215), who have forwarded a large and most interesting series of objects of a kind of terra-cotta, originally intended for architectural decoration in restoring old ecclesiastical edifices. The colour of this artificial stone is naturally a yellowish white, but for certain objects it is produced of an Etruscan red or black. It takes all colours and glazes perfectly well, and has been long and extensively used in France, where it is not only employed for the construction and restoration of buildings, but also for statues and vases, and even for pulpits, altars, piscinas, and other decorative work in the interior of churches. The chief object exhibited is a chimney-piece of great beauty in the renaissance style, but there is also a large series of objects adapted to church architecture. These exhibitors have received testimonials from engineers and architects of eminence.

Mr. DUNAY, of Paris (France, 45, p. 1173), an artist who has contributed some objects of beauty and excellence, manufactured in a kind of terra-cotta, is considered by the Jury to be worthy of Honourable Mention. Among

the works of this artist are two figures which show considerable skill in design and treatment, as well as in the nature of the material.

Honourable Mention is made also of Mr. HOLSTEIN (France, 876, p. 1221), an exhibitor of terra-cotta mouldings; of Mr. GARNAUD, jun. (France, 233, p. 1187), who shows various specimens of white terra-cotta of considerable hardness, adapted to external work for houses, and also for sculpture; and of Mr. C. DE BOISARMON (France, 427, p. 1199), for ornamental vases and fire-bricks. The material in all these French terra-cottas is of singularly fine quality and even texture, and the tint is remarkably delicate and uniform. The articles manufactured are in a bold free style, well modelled and well burnt, and do great credit to the several exhibitors; but the Reporter regrets that he has no special or detailed information as to the nature of the raw material, the localities in which it is found, the mixtures of the clay, sand, and broken pottery employed, or the heat of firing. It may be remarked that in all of them the colour is pale, showing an absence of iron in the clays.

There are some German exhibitors of terra-cotta, whom it is necessary to allude to. Messrs. STAIB WASSEROTT, of Ravensburg (Wurtemberg, 69, p. 1118), are distinguished by the Jury with Honourable Mention as manufacturers of some very well-constructed architectural objects of a good kind of terra-cotta of red colour. These include only part of a large series of such objects, to be procured at the manufactory of the exhibitors, who have forwarded a volume exhibiting drawings of their different products, including pavements, draining and other tiles, and a large variety of mouldings, windows, and other architectural contrivances; considerable taste in the application of the material is manifest in the designs in this volume.

Mr. ERNEST MARCH, of Berlin (Prussia, 240, p. 1061), has sent an extensive series of dark red and pale terra-cottas, showing great merit in design, and moulded of the dust of the high road near Berlin; much ingenuity is shown in rendering available this peculiar material, and the exhibitor is Honourably Mentioned for these terra-cottas, besides which, he has sent some chemical utensils. Other objects of similar material exhibited amongst the Zollverein goods, and appearing in their Catalogue, are a group of considerable elegance sent by the Government engineers at Wiesbaden, and affording good illustrations of the excellent clay of the Duchy of Nassau. There are also some imitations of freestone in clay, and other smaller objects, which we need not here particularise.

A few excellent and useful works in terra-cotta are exhibited from other countries, of which the Jury have noticed some from Switzerland worked into good designs, and others from Tuscany. The former include a font, showing much elaborateness and considerable skill, exhibited by J. ZIGLER PELLIS (260, p. 1283), (awarded Honourable Mention in Class XXV.), the latter, a stove in terra-cotta exhibited by L. CANTAGALLI, of Florence (Tuscany, 88, p. 1297), adapted to the country, but not likely to be valued in England. The colour of the former of these objects is an extremely dark red, and it well deserves Honourable Mention.

From Spain and Portugal respectively, there have been sent for exhibition specimens of the large earthen jars used in those countries for preserving oil, wine, and other products. These jars are often made very much larger than the specimens exhibited, containing sometimes many times the quantity that these would do, but they are remarkable and interesting examples of a manufacture of great antiquity, much ingenuity, and considerable importance. The large jar (*tingja*) exhibited by Mr. M. YASAT (Spain, 51, p. 1332), is from Toboso (Mancha), and is Honourably Mentioned by the Jury. Such jars are buried in the earth in a kind of cement, and preserved in this way for an indefinite period. They are made by hand without the wheel, and are fired in an oven constructed on purpose, the interior being made use of to receive a number of small objects fired at the same time. The most celebrated and largest manufactory of these jars is at Toboso. The inside is sometimes varnished to receive spirits.

There is a Portuguese jar from Alemtejo, accompanied by two earthen pots used in cooking, remarkable for their extreme durability and thinness, considering the uses to which they are applied. The material is apparently a very silicious clay containing some mica.

#### N. GAS-RETORTS, FIRE-BRICKS, &c., AND CHEMICAL UTENSILS.

We have already mentioned the use of fire-clay (obtained generally in this country from beneath certain seams of coal), and its value in the manufacture of terracotta, where being burnt at a high heat, the clay requires to be of such a nature as to resist fusion, or in other words, to have the property understood by the term *refractory*. Many other specimens of manufactured fire-clay have been sent, adapted to special and most important purposes, and we proceed now to enumerate the exhibitors, and the nature and degree of excellence of the objects exhibited. It is to be regretted that there are not more exhibitors to compete with each other in this department, but some of those to whom we shall allude have sent specimens which are highly creditable.

The Reporter has had the advantage of an opinion and report communicated by George Lowe, Esq., C.E., F.R.S., one of the Associate Jurors in this matter, whose judgment has assisted in guiding the Jury in their awards.

Messrs. JOSEPH COWEN and Co., of Blaydon Burn, Newcastle-on-Tyne (113, p. 772), are exhibitors of samples of fire-clay, fire-bricks, and patent fire-clay gas retorts, which are all of admirable quality, and bear the highest reputation. The Jury have, therefore, awarded a Prize Medal to them.

The use of fire-clay is not of very ancient date, and has greatly increased within the last few years. It is found in England almost exclusively in the coal measures, and from different districts the quality is found to differ considerably. The so-called "Stourbridge clay" is the best known, and will be alluded to presently; but other kinds are almost, if not quite, as well adapted for the higher purposes of manufacture, being equally free from alkaline earths and iron, the presence of which renders the clay fusible when the heat is intense. The proportions of silica and alumina in these clays vary considerably; the former amounting sometimes to little more than 50 per cent., while in others it reaches beyond 70; the miscellaneous ingredients ranging from less than 1½ to upwards of 7 per cent.

The works of Messrs. Cowen and Co. are among the most extensive in England, and they obtain their raw material from no less than nine different seams, admitting of great and useful mixture of clay for various purposes. After being removed from the mine, the clay is tempered by exposure to the weather, in some cases for years, and is then prepared with extreme care. The objects chiefly made are fire-bricks and gas retorts, the latter being now much used and preferred to iron for durability. These retorts were first made by the present exhibitors in ten pieces (this being twenty years ago), and since then the number of pieces has been reduced successively to four, three, and two pieces, till, in 1844, they were enabled to patent a process for making them in one piece; and, at the present time, they are thus manufactured of dimensions as much as 10 feet long by 3 feet wide in the inside, which is, however, more than double the size of the largest exhibited by them.

The following extract from the Report with which Mr. Lowe has favoured the Jury, will be read with interest. He says,—

"I recommend this exhibitor from my own knowledge as connected with the extensive furnace work of the Chartered Gas Company during the last thirty years, at which period we were buying Stourbridge goods from 8½ to 10½ per thousand, when a fair trial of Mr. Cowen's bricks, at just one-half the price, convinced us then, and have ever since proved to us their excellency. One especial feature in these bricks and retorts visible to the eye, and so essential to their withstanding high heats, is their freedom from iron, which acts the part of a flux, destroying the otherwise good properties of many fire-

clays. This he arrives at by following the Chinese practice of submitting his clay for years exposed to all weathers, turning it frequently over, whilst young hands pick out the fossiliferous fragments, generally pyritous, which this disintegrating process lays open to observation. The clay contains a high per centage of silica. Add to these points great care in the manufactory, in which every appliance is to be seen, and we have nearly the secret of Mr. Cowen's fame. He has testimonials from all quarters, one from Rouen, stating thirty-eight months as the durability of some of his retorts, being four times that of iron ones."

The fire-bricks exhibited by Messrs. Cowen are sold at from 40s. to 50s. per 1,000 on board at Newcastle, the price varying with the size. The same articles are delivered in London at from 50s. to 70s. The retorts are from 60s. to 80s. each at Newcastle, and in London from 5s. to 10s. more.

Messrs. HARPER and MOORE, of Stourbridge (119, p. 773), are exhibitors of fire-clay bricks remarkable for their hardness; and they also send a glass pot. All these objects are well made, of good colour, and free from iron; and are considered worthy of Honourable Mention. The large pots are used in the manufacture of plate, crown, and sheet glass; and those of smaller size in the manufacture of flint glass: the pots remaining in the furnace till worn out or broken, and lasting sometimes for two years. One of the vessels with an open top (called a curvett) is used to convey the melted glass from the interior of the furnace to the casting-table for plate glass, a test, perhaps, the most severe that a fire-clay vessel can be put to, but which some of those made by these exhibitors have stood 180 times without breaking. The purest fire-clay, in which iron is entirely absent, is needed for such purposes. The wholesale price of the curvetts is 40s. each.

The crucibles shown by Messrs. Harper and Moore are made by hand, and are extensively used for brass, iron, steel, silver, gold, and other metals. The bricks used for lining the inside of glass-house and other furnaces, where long-continued and intense heat is applied, are also of good quality.

Glass-house pots are also exhibited by Messrs. SQUIRES and SONS, of Stourbridge (Class I., 117, p. 133), and Messrs. HARTLEY, of Sunderland.

The celebrated fire-clay used by these and other Exhibitors, and so widely celebrated as Stourbridge clay, lies about 15 feet beneath the lowest of three workable seams of coal (each averaging 6 feet thick), worked at Stourbridge in the lower coal measures in the south-western extremity of the Dudley coal-field. The bed of clay is four feet thick; and the following is the composition, according to Berthier, quoted in Dufrénoy's "Mineralogie," vol. iii., p. 259:—

|               |   |   |        |
|---------------|---|---|--------|
| Silica        | - | - | 63.70  |
| Alumina       | - | - | 22.70  |
| Oxide of iron | - | - | 2.00   |
| Water         | - | - | 10.30  |
|               |   |   | 100.00 |

Other British Exhibitors of similar objects are Messrs. KING, of Stourbridge (Class I., 91, pp. 130, 131), well known for their manufactures of fire-clay goods from this celebrated district, and the Exhibitors of a large and interesting series, including the raw material unburnt and finished articles of manufacture, and a small model of a glass-house. Owing to some cause, the goods here shown are not altogether such as to do credit to the maker. The best objects from Messrs. King are the crucibles, and the greatest interest attaching to their group arises from the fact that the raw or unburnt pots, &c., are shown as well as those which are burnt.

Gas retorts of very fair quality are shown by Mr. RAMHAY, of Newcastle, who has also succeeded extremely well in the manufacture of fire-bricks, chimney-pots, and other goods. The retorts show a little more iron than is desirable, but the Exhibitor has been considered worthy of Honourable Mention. Retorts of less creditable appearance are exhibited by Messrs. HICKMAN and Co., of

Stourbridge (Class XXVIII., 107, p. 772), and Mr. A. PORTER, of Newcastle (Class XXVII., 115, p. 773). The surface of both these retorts is cracked and undulating. When we consider the high and long-continued temperature to which these objects are exposed, the absolute necessity of attending to every detail in mixing the clay and moulding the retort will be at once recognised; and the apparently slight defects of some of those sent for exhibition, require to be noticed as of real importance. Mr. J. PRASE (Class I., 122, p. 139) is Honourably Mentioned for some fire-bricks of excellent quality exhibited by him.

Next to England, the finest specimens of fire-clay goods, on a large scale, are from Belgium, from which country there are three exhibitors of gas retorts. The Jury have awarded a Prize Medal to one of these, Mr. T. LOUCHER, of Baudour (399, p. 1163), who has sent a well-made retort, extremely thin, of good structure, and free from surface iron and cracks. The Jury have awarded the Medal to this Exhibitor on account of the undoubted superiority which it presents over other similar objects from the Continent, and do not enter on any question of priority of manufacture that may arise, or identity of methods adopted by this and other Exhibitors.

The Jury have awarded Honourable Mention to Mr. A. SMAL-WERPIN, of Huy, Liège (398, p. 1163), for a neatly-made retort of rather indifferent colour; and also to Messrs. B. PASTOR and Co., of Ardennes, Namur (395, p. 1163), (granted by Class I. likewise) whose retort is extremely thin and well made (thickness only  $2\frac{1}{2}$  inches), but faulty in colour, the foxy appearance indicating the presence of iron, which cannot fail to act as a flux. Besides the retort, these Exhibitors have sent fire-bricks and lumps, having the same fault in colour, but very beautiful in point of manipulation.

France has sent only one specimen of fire-clay gas retorts, and that not remarkable for excellence. The Exhibitor is Mr. PAUWELS, of Paris (1382, p. 1242), who exhibits also an ingenious gas moderator, which does not come before the present Jury for consideration. Fire-bricks and vases are sent by Mr. DE BOISSIMON, of Langeais (427, p. 1199), an eminent manufacturer on the Loire, who has been already referred to, and has received Honourable Mention.

Refractory bricks are sent by two Exhibitors from Portugal and one from Spain. Of the former, some (275 to 278, p. 1311) from the MANUFACTORY at HULHOENS, promise well, but there is no proof of their excellence beyond the appearance of the brick. They are, however, Honourably Mentioned, and the Jury also mention in the same way Mr. JOSE FERREIRA PINTO BASTO (Prize Medal in Class XXV.), of Vista Alegre (279, p. 1311), who exhibits refractory bricks. The Jury are informed that these bricks are made of a clay also used for earthenware, and certainly admirably adapted for the finer works of this kind, and that the Exhibitor is the discoverer of this bed, which has been used for more than a quarter of a century in the porcelain works at Vista Alegre, now very extensive. Great credit appears to be due to Mr. Pinto for the persevering industry with which he has struggled against numerous difficulties, and succeeded in introducing into his country a most useful and important manufacture. The bricks exhibited are neat, and appear of good quality. They contain much of what is technically called "grog" (coarse fragments mixed with fine paste), which renders them capable of standing a sudden application of heat without cracking, but the small extent of the exhibit does not justify the Jury in giving more than Honourable Mention.

The bricks sent by the AULENCIA COMPANY at Madrid (53, p. 1332) are light and of open texture. The colour is very white, and the raw material, which has only been brought into use very lately, appears to be of remarkably fine quality. As there happens to be a considerable demand in Spain for various articles of fine pottery, the more extensive working out of this deposit appears to be a very important matter.

From the Zollverein we find one exhibitor of fire-clay

and brick crucibles. Mr. VON MULMAN, of Siegburg on the Rhine (West Prussia, 319, p. 1068) who also sends chemical utensils. This manufacturer makes fire-bricks for blast furnaces and puddling furnaces at a very moderate cost.

Besides the objects in refractory clay already considered, there are some others, chiefly chemical utensils, which, from their condition, magnitude, and other circumstances, are referred to Class XXVII., and which, therefore, it becomes our duty here to report upon. For this purpose the Jury called in the aid of an Associate Juror, T. H. Henry, Esq., F.R.S., and have perfect confidence in the results they have been enabled to arrive at.

The largest and most important exhibitor of crucibles manufactured of an admixture of fire-clay and plumbago, and required for purposes where an intense heat is employed, as for the melting of steel and reducing the precious metals, is Mr. H. W. RUEL, of London (Class I., 435, p. 161), to whom a Prize Medal has been granted. The crucibles in question are described, both in this and other countries, as if made of plumbago, but consist, in fact, of an admixture of that mineral, in variable proportions, with the finest and purest fire-clay. The introduction of the plumbago, is, however, a very important modification, and acts by preventing the injurious effects of contraction and expansion during change of temperature. Besides plumbago, other forms of carbon are sometimes used, especially pounded coke. The best crucibles for the purposes that require the greatest resistance, are either made of one-half of a finely-ground cement or paste, consisting of old crucibles and fire-clay and one-half coke and graphite, or of larger proportions of clay; but those used for the assay of the precious metals are sometimes made of two-thirds graphite.

The crucibles of Mr. Ruel are of the very best quality, and the Associate Juror, Mr. Henry, thus reports on them:—"Mr. Ruel has so improved the black-lead or plumbago crucibles, as to drive the foreigners out of the English market, and his articles are preferred abroad. I have repeatedly tried them and have found them excellent. Messrs. Brown and Wingrove, the gold-smelters, use them exclusively, I understand, and in order to make sure I have asked them for a written opinion.\* Ruel's assay crucibles resist the action of fused oxide of lead much better than any others I have tried. Mr. Ruel is, I believe, the oldest crucible maker in this way, and I think his great merit lies in working steadily for a considerable time to improve the English manufacture, and gradually vanquish the strong prejudice in favour of a foreign article by the superiority of his own production."

To Messrs. LORENZ, KAPPELLER, and SON, of Hafnerszell, near Passau (Bavaria, 28, p. 1099), a Prize Medal has also been awarded for black-lead crucibles, which are described as of more refractory character than usual, and which appear to justify this account. The specimens sent include one of very unusual dimensions, measuring 2 feet high and 20 inches in diameter. They are very well made. These manufacturers have long enjoyed a very high reputation in the European market, and their crucibles are extensively sold, having been generally regarded as the nearest rivals to those made of Stourbridge clay.

Mr. F. COSTE, of Tilleur, Liège (Belgium, 397, p. 1163), is an exhibitor of plumbago crucibles of good quality, and is considered worthy of Honourable Mention. These he exhibits are of two kinds, one of them not containing plumbago, but the former, adapted for melting steel, are so contrived as not to require removal for a fresh charge, and thus present a novelty of construction.

Other plumbago crucibles are sent by Mr. G. B. ARWOOD, of Massachusetts (United States, 426, p. 1463), but they are understood to be really English, made from

\* The written opinion thus requested has been submitted to the Jury, and establishes the fact that this exhibitor's crucibles are of the very best quality for all the most important purposes for which such utensils are required.

American plumbago, and are not in other respects remarkable.

To Messrs. C. E. and F. ARNOLDI, of Elgersburg, in the Duchy of Saxe Gotha (Prussia, 778, p. 1093), Honourable Mention is awarded for a considerable variety of chemical apparatus in earthenware exhibited by them, and of very good quality. The principal objects here to be noticed are the crucibles, which are of four sorts, but there are also retorts, alembics, and distilling apparatus, besides other articles.

Mr. E. MARCH, of Berlin (Prussia, 840, p. 1061), has been already mentioned for his terra-cottas, but he is also an Exhibitor of chemical apparatus of good quality, the principal articles being two large and fine jars for distilling acid. In France we have Mr. BONNET, jun. (1096, p. 1230), exhibiting a muffle and various chemical apparatus, considered deserving of Honourable Mention, the muffles being constructed in parts to avoid fracture by heating; and there are also some very neatly-constructed crucibles, and other apparatus, exhibited by Mr. DRYEUX (France, 476, p. 1200), which appear to be of very good quality.

We find exhibited in Class I. (118, p. 133), a number of melting-pots made for casting brass, and other metals, by Mr. S. ANSTET. These have been in use for some time, and are made by a patented process. They are recognised as of good quality in all respects.

#### O. GLAZED FIRE-CLAY GOODS.

There are several Exhibitors of glazed fire-clay goods, some of them nearly approximating the manufacture of porcelain, but the articles are considered to belong to the present division of clay manufactures. One of the chief of these is the firm of Messrs. S. GREEN and Co. (125, pp. 775-6), to whom a Prize Medal has been awarded in another Class (Class XXV.), but whose salt-glazed ware demands notice here.

This ware is of various qualities, according to the purpose for which it is required, some objects, as ginger-beer bottles, jars, &c., being comparatively coarse, while for chemical utensils it is impossible that too much care can be taken, or too much labour and ingenuity devoted to insure accuracy of form and uniformity of texture. For the principal part of the manufacture the clay is mixed, moulded, and dried, as for other pottery ware, but it is burnt in a room which admits of a degree of heat being applied which would melt any clays, unless of the finest natural quality, or very carefully prepared. In addition also to this high degree of firing, the glaze, instead of being applied by dipping, as is usual with earthenware, is produced by throwing into the furnace, at a certain stage of the process, a quantity of coarse salt, which is instantly vapourised by the intense heat, and this vapour, penetrating to every part of the kiln, produces decomposition where it touches the vessels that are being baked; a film of glass being formed by the combination of a portion of the silica of the clay surface with the soda, while any iron that exists is brought to the surface, becomes oxidized, and gives a tint of colour apparently also adding to the strength of the glaze.

Among the objects thus produced, the exhibitors to whom we have already referred, Messrs. S. Green and Co., have manufactured some of the finest and largest that have been brought into the market; but Messrs. DOULTON and Co., and DOULTON and WATTS, have also sent admirable specimens of great practical utility. Numerous examples are exhibited, both in Class XXVII. and outside the Building, in the North Western Enclosure. The Jury have especially noticed a group of objects by Messrs. Doulton and Co., including pipes of unusual size, and chemical vessels also of large size and extremely perfect; besides a series exhibited by Messrs. SNODGRASS, remarkable for being glazed inside only, the body vitrified as usual, and the surface of the ware being dry or unglazed. The advantage of the latter condition is considered to be the least probability of cracking, on the application of heat from the outer surface expanding more readily than if it were glazed in the usual way. All the exhibits hitherto mentioned have been distinguished by Prize Medals; and although the manufactures in this

kind of material are in no degree less important than others already described in some detail, we can only here refer to them without announcing any further reward. It may, however, safely be said, that the objects exhibited on the English side in glazed stoneware, are worthy of great commendation for their excellence, and not less so for their great utility.\*

Mr. RUFFORD (89, p. 770) has received Honourable Mention for an ingenious porcelain bath in one piece, two wash-tubs, and several glazed bricks, the former presenting a white glaze upon fire-clay, and being remarkable for its novelty and cheapness. The present exhibitor invented his process for making such baths at the instance of the Society of Arts in the season of 1846-7. The following account has been forwarded to the Reporter:—

"The stone materials for this purpose, viz., fire-clay, China clay, and the glaze, are so assimilated that the two clays are of the same porosity, bear the same heat, expand and contract alike, and the glaze will melt only when the fire-clay is sufficiently burnt. They undergo seventy-two hours of white heat, are not sufficiently fired until cold-blast cast-iron will melt, and they are produced in the glazed finished state at one burning."

In this state they can be cut with a chisel, are perfectly non-absorbent, and are not affected by heat, cold, or damp. The full-sized adult bath costs, if perfectly free from blotchiness, 7*l*. First class, such as exhibited, 5*l*. 10*s*., or 5*s*. extra if marbled. Second class, colours not clear but body sound, 3*s*. 6*d*. to 6*s*. The glazed white bricks are 1*s*. 6*d*. per hundred, and are found to stand well.

Mr. E. UNGERER, of Hirschberg, in Silesia (Prussia, 241, p. 1061), exhibits a set of water-pipes in glazed stoneware of very excellent quality, and is Honourably Mentioned by the Jury.

MESSRS. SALT and MEAR, of East Liverpool, Ohio (United States, 203, p. 1450), exhibit a water-vase of somewhat remarkable appearance and good material, and are also Honourably Mentioned.

#### Miscellaneous.

There are two exhibitors in a material which, as it consists of porcelain, might be referred to Class XXV., but which, being widely disconnected in its application from the ordinary uses of that material, and being included in Class XXVII., have been considered by this Jury.† One of them presents an adaptation of porcelain for architectural decoration, and the other for street labels, and we can say only a few words concerning each of them.

To Messrs. BOWERS, CHALSHINOR, and WOOLISCHROFF, of Tunstall, in the Staffordshire Potteries (104, p. 772), a Prize Medal has been awarded for a newly-patented

\* Although by the decision of the constituted authorities the Medal which had been awarded to Messrs. S. Green and Co., in Class XXVII., has been withdrawn in favour of the similar honour awarded by the Jury of Class XXV., the author of the present report cannot pass on to other exhibitors without giving some account of the objects which chiefly attracted the attention of his Jury. These are, the large jar, the condensers, the air-tight stoppers, and the acid pump exhibited within the Building, and the whole apparatus of the retort placed outside.

† Of these the jar is stated to have a capacity of 420 gallons; and, although not without flaws near the base, is yet so perfect in its essential characters, and so much larger than those usually produced, as to be an extremely remarkable and interesting object. The condensers are not only large, but perfect; and the spherical stopper and valve are so ground as to be perfectly air-tight, and must be regarded as an admirable and most useful contrivance. The jar is, perhaps, the largest piece ever manufactured in this ware; and it must be recollected that the degree of heat required to admit of the salt-glaze, is extremely different from that used for the large jars from Spain and Portugal. In addition to the articles mentioned, is a triangular worm of a still, which is perfectly air-tight, but admits of being readily and perfectly cleaned in every part. The Jury noticed with great commendation the care and attention bestowed by these exhibitors on chemical and other apparatus.

application of coloured and moulded porcelain for architectural decoration, capable of being carried out to a great extent, and especially adapted for door-cases and arches, window-cases and arches, string courses, bricks, and cornices for shop-fronts, &c. The material is cheap, brilliant in colour, sharp, and perfectly durable. Some of the decorations exhibited are very elegant, but they admit of great improvement, for which the material is well adapted.

A Prize Medal has also been awarded to Messrs. SKINNER and WHALLEY (121, p. 774) for a vitreous marble paste in a kind of porcelain, extremely hard and durable, and better adapted for street labels than anything hitherto introduced.

Mr. J. BRANNAM (131, p. 776) has exhibited a small collection of jugs, pitchers, &c., in stone-ware, which, although placed in Class XXVII., more properly belong to Class XXV.; and this is the case also with Messrs. WESTWOOD and MOORE (Class XXVII., 113, p. 778), who send some articles of stone-ware and others of glass, which we can here only mention.

A porcelain stove is exhibited from Frankfort (16, p. 1122), by Mr. J. HOFFMAN, and other similar objects are elsewhere in the Building. Some articles in porcelain of more miscellaneous character have been considered by the Jury of Class XXV. Such are those sent by Mr. GILLE (France, 848, p. 1220), Messrs. MINTON (p. 770), and Mr. J. G. DOWSON (Class XXII., 476, p. 648), all of whom are exhibitors of chimney-pieces constructed of porcelain. The two former are noticed in Class XXV.

Messrs. MAYO and Co., of Cheapside, London, are exhibitors of a new kind of joint patented by them, and intended to connect glass pipes conveying gases or fluids (Class I., 18, p. 122), and also of patent siphon vases for containing aerated mineral waters (Class XXVII., 7, p. 764). Both these contrivances are useful and ingenious, and the Jury have awarded a Prize Medal to the exhibitors. The two inventions are combinations of metal with glass or pottery, and are already sanctioned by experience.

To Mr. E. J. GOATES, of Bread Street (Class XXVII., 18, 19, p. 765), a Prize Medal is awarded for a cheap and useful combination of iron and glass in the construction of mantelpieces. These are very inexpensive, have a good effect, and are extremely durable, and are said to have been extensively introduced in the United States, although new in England.

A new style of glazing greenhouses and other constructions in glass has been exhibited by Mr. KENT, of Chichester (Outside West, 62, and Class XXVII., 122, p. 774), and is Honourably Mentioned by the Jury. In this method vulcanized Indian rubber is introduced, and the glass is fastened without putty.

Another construction has been exhibited by Mr. DENCH (Outside West, 61, p. 117), of something of the same kind, and is also Honourably Mentioned.

Mr. LIPSCOMBE (Class XXV.I., 49, p. 767) is the exhibitor of several small drawing-room fountains, showing some ingenuity and elegance. There is, however, nothing very new introduced in the construction.

Mr. W. BLAKE, of New York (America, 233, p. 1451), exhibits a kind of earthy fire-proof cement or paint, said to form a very compact and strong film resembling slate, and quite impervious to moisture. It is described as occurring in a stratum of rock at Ohio, and is apparently a kind of clay of black colour, and readily reduced to a fine powder. Mixed with linseed oil it forms a pigment of slate or chocolate colour, which hardens on exposure, but does not crack or peel, and is adapted for outside painting, or on damp walls, decks of ships, &c.

## APPENDIX.

### EXPERIMENTS ON THE STRENGTH OF PORTLAND CEMENT.

Two exhibitors of Portland cement on a large scale, Messrs. J. B. WHITE and SONS, of Millbank, and Messrs. ROBIN, ASPDIN, and Co., of Great Scotland Yard, to both of whom Prize Medals have been awarded, intimated to the Jury their wish to illustrate the strength of their cement as compared with other kinds, and accordingly such members of the Jury as were in town and were able to attend, were present at a series of experiments for this purpose, on the 20th, 22nd, and 23rd September. An account of these experiments is here appended, and some further experiments were performed on the 24th September in the presence of Sir C. Pasley and some other gentlemen, an account of which, attested by them, will also be given.

The first experiments were performed by Messrs. White and Co., and were intended to allow the relative strength of Portland and Roman cements. The weights used throughout were iron pigs, estimated at 140 lbs. each.

1. A block of neat Portland cement, 16 inches long, and having a sectional area of 16 inches (4 inches square,) was suspended from each end, and the weight applied exactly in the centre. The block had been made four months. It broke at 1,580 lbs., including the weight of the scale (estimated at 80 lbs.). The fracture was perpendicular, even, and good.

2. A block of neat Roman cement, made from Harwich stone, and seven weeks old, broke at 380 lbs. This must have been a bad sample of the material.

3. A similar block of neat Sheppey cement, made in the month of May, broke at 980 lbs.

4. A block of neat Portland cement, having a sectional area, measuring 2½ inches by 2 inches, made 31st March, was pulled asunder with the fracture as shown at the top, at 2,280 lbs.

5. A block of Portland stone, having the same sectional area, and in all respects resembling the above, broke at 1,480 lbs. The fracture showed no flaw in the stone, which was of even grain and good quality.

6. Two blocks of Portland stone, being 6-inch cubes, had been cemented with about one-eighth of an inch thick of Portland cement, about four months before the experiment. The upper stone being held by iron clippers, the weights were suspended from the lower one, the depth of the holes for the clippers being five-eighths of an inch. When the weight amounted to 3,780 lbs., the former broke. The square holes for the clippers being made deeper in another part of the stone, and the scale being once more loaded, the iron hook by which the scale was suspended broke at 3,580 lbs., the cement still remaining perfectly sound. In this experiment, therefore, the strength of the cement was not absolutely tested.

7. Two similar blocks of Portland stone joined together with Roman cement, the thickness of the joint being a quarter of an inch, and the age five months, were separated by 2,780 lbs. The cement in this case left the stone partly on the upper, and partly on the lower surface, showing that the adhesive force of the cement was greater than the cohesion. It was estimated that Roman cement, under such circumstances, would separate at under 1,000 lbs.

8. Five hard stock bricks were taken, cemented together with a mixture consisting of one-half Portland cement and one-half sand. They were suspended from the upper brick, and the scale was attached to the lower. The fracture took place at 2,580 lbs. at the top brick.

9. The principal experiment of Messrs. White consisted in breaking down a beam constructed of ten courses of hollow bricks cemented together, the upper part having three courses on edge and four flatwise, and the lower part two courses on edge and one flatwise. They were fastened with Portland cement, and strengthened by lengths of hoop iron, a number of which, amounting to

fifteen, were inserted. The iron measured  $1\frac{1}{2}$  inch by  $\frac{1}{4}$ th nearly. The following are the dimensions of the beam:—

|  |          | ft.    | in.  |
|--|----------|--------|------|
| Total length                           | —        | 21     | 4    |
| Length between bearings                | —        | 21     | 4    |
| Depth                                  | —        | 4      | 6    |
| Thickness at bottom                    | —        | 2      | 3    |
| "          top                         | —        | 1      | 6    |
| It was built of 1,200 hollow bricks,   | weighing | 10,750 | lbs. |
| 32 bushels cement                      | "        | 6,400  |      |
| 32 " sand                              | "        |        |      |
| Total weight of beam                   | —        | 17,150 |      |
| Weight of stone at the top of the beam | —        | 672    |      |
| attached scale                         | —        | 1,792  |      |
| suspended portion of beam              | —        | 15,000 |      |
| Total suspended weight                 | —        | 17,464 |      |

It may be well to state, that if built of common bricks and fastened with Roman cement and sand, the net weight of the beam, including scale and stone, would have been 21,207 lbs., being a difference of 3,743 lbs. resulting from the use of hollow bricks.

On the other hand it appears that the actual area of cemented surface is only 700 square inches instead of 1,060, which it would have been if solid bricks had been employed; for it appears that the actual sectional area of the bricks is  $5\frac{1}{2}$  by  $4\frac{1}{4}$  inches, the ends or sides being  $\frac{1}{4}$ th inch, so that the hollow part may be estimated at 9 square inches. There are in all forty vacuities, and we thus have—

|                                   | Inches.             | Sq. Inches. |
|-----------------------------------|---------------------|-------------|
| Six uppermost courses, measuring  | $36 \times 17.25 =$ | 621         |
| In sectional area                 | —                   | —           |
| Three lower courses, measuring in | $16 \times 26.6 =$  | 439         |
| sectional area                    | —                   | —           |
|                                   |                     | 1,060       |
| Deduct spaces = $40 \times 9 =$   | —                   | 360         |
| Total sectional area cemented     | —                   | 700         |

The depth of the beam being  $52\frac{1}{2}$  inches, we thus have, as a measure of the strength of the beam,  $700 \times 52\frac{1}{2} = 36,750$ .

One object in the peculiar form and proportions of this beam was to institute a comparison between the strength of Roman and Portland cement, a similar beam having been constructed in 1837 at Nine Elms, by Messrs. Francis and White, at the suggestion of Mr. Brunel, the bricks in which were, however, common stock bricks, bonded in the usual manner, and bedded and grouted with a mixture of equal parts of the best Roman cement and clean Thames sand. In this beam there were nineteen courses, the thirteen uppermost being two bricks thick, and the six lower ones two and a-half; the sectional area being 1,107 superficial inches, and there were inserted fifteen lengths of hoop iron  $1\frac{1}{2}$  inch by  $\frac{1}{4}$ th. The beam was borne on two pieces, leaving a clear bearing of  $2\frac{1}{2}$  feet 4 inches; and after it had been built about three months it was loaded with 11,200 lbs. of pig-iron, placed on a platform suspended from the central part of the beam. At the end of another three months the weight was increased to 24,000 lbs. After twelve months it was broken down by increasing the weight to 50,622 lbs.

The depth of this beam being 57 inches, the measure of its strength compared with that of the other is  $1,107 \times 57 = 63,099$ ; and since  $63,099 : 36,750 :: 50,622 : 29,500$ , it is considered by the exhibitors that the breaking weight of their beam, if in Portland cement, ought to have been 29,500 lbs.

The beam, as originally constructed on the south side of the Enclosure outside the western extremity of the Exhibition, was completed in April last, and has since been left unsupported, carrying 17,464 lbs., as before explained, consisting of the weight of the beam itself, the stone, and the scale, until the 20th September. On that day it was loaded in the centre part with 15,000 lbs.

weight of pig-iron, and in this state was left till Monday, when it was carefully examined, and found free from any flaw. The loading was then continued until it was weighted with 40,000 lbs., when a deflection of nearly one-eighth of an inch was observed. Shortly afterwards, at 41,600 lbs., two cracks were detected, commencing on each side at the fourth brick from the centre, and before long a third crack exactly in the centre. One of these cracks commenced with the fracture of a brick, but the other two at the contact of the cement with bricks. When another 10,000 lbs. had been added, the iron hoop was heard to crack, and the piers were slightly affected, as was proved by the breaking of a string that had been stretched from one end to the other to measure the deflection. With this weight also the cracks extended through the six lower courses, and the deflection was about five-sixteenths of an inch. Additional weight being still put on up to 62,800 lbs., this weight was borne for a short time, but the fissures all widened manifestly; the central one extended vertically through bricks and cement indifferently, and the beam at length separated into two parts, thrusting the piers considerably out of the upright.

After the conclusion of the experiment it was found, that of the iron hoop there were only thirteen pieces traceable, and of these ten were torn asunder at the principal central crack; the other three were doubtless broken also, but at the side fissures. The important part played by the iron in this case must not be overlooked, but cannot very easily be estimated. As a practical proof, however, of the use of brick beams and their strength, this experiment is of considerable value in itself, besides affording an additional proof of the value of Portland cement.

The true comparative strength of Roman and Portland cement is, perhaps, not so well tested as if the bricks had been of the same kind in the two experiments; but estimating as nearly as circumstances will admit, it appears that the Portland bears to the Roman a ratio of  $\frac{2}{3}$  to 1 very nearly. It must, however, be remembered that the Roman cement beam had been built seventeen months, and the Portland only five, a fact greatly in favour of the former material.

The experiments of Messrs. Robins and Aspdin were of somewhat similar nature, but cannot be regarded either as identical or parallel. They were made on various mixtures of Portland cement, some of them joining together bricks and stone, and others formed into slabs of various dimensions. There was no experiment on so large a scale as the brick beam of Messrs. White, but the other specimens were, on the whole, larger, and the illustrations were of great interest. We proceed to enumerate them.

1. A block of the shape of that shown in Experiment 4, of Messrs. White, but consisting of three parts of sand and one of Portland cement, and having a sectional area of 4 inches by  $2\frac{1}{4}$  inches ( $= 8.5$  square inches) was suspended from a clip, and held a scale weighing about 1 cwt. The block had been made about one month. It broke at 2,400 lbs., including scale, the fracture resembling that in the other case, but a part of the cement being broken off by the clip.

2. A similar block, having a sectional area of  $3\frac{1}{2}$  by  $2\frac{1}{4}$  inches, and made with four parts sand and one part Portland cement, broke with 2,600 lbs., including scale. The fracture was clean, and at the lower part of the neck. The texture of the cement was even.

3. A beam of sixteen common stock bricks, joined by very thick intervals of real Portland cement, was held at the extremities, and broke by a weight of 500 lbs. suspended from the middle. In this case the part broken was the brick only. The beam had been made one month.

4. A similar beam of the same magnitude, but having one end only supported, and projecting 3 feet  $2\frac{1}{4}$  inches from the bearing point, was weighted, and broke with 256 lbs., exclusive of the scale suspended from the free extremity. In this case the fracture took place at the eleventh brick from the fixed extremity, and both brick and cement were fractured.

5. Another beam of twenty-two bricks, also fixed at one extremity (only the number free being reckoned),

was broken by  $1\frac{1}{2}$  cwt., in addition to the scale. The length of this beam was 51 inches.

6. A solid step, constructed of two parts Portland cement and one part broken brick, and weighing  $6\frac{1}{2}$  cwt., was fixed at one extremity, leaving 6 feet  $4\frac{1}{2}$  inches projecting. It supported its own weight, and broke off close to the bearing point, when the third weight of 56 lbs. (making a total of 168 lbs.), was placed on the extreme end.

7. Two blocks of neat cement, 1 foot  $5\frac{1}{2}$  inches long, 9 inches wide, and  $4\frac{1}{2}$  inches thick, cemented together with neat cement, broke at 6,000 lbs. The lower part of the block gave way.

8. Twenty stock bricks in courses, united with cement, composed of one of cement and one of sand, 3 feet  $6\frac{1}{2}$  inches bearing, the ends supported by iron clamps, and the weight applied to the centre. The bricks broke at a weight of 1,200 lbs.

9. Six fire-bricks in courses, joints all cement. The upper brick broke at 2,836 lbs.

10. The five fire-bricks from the last trial were again tested, the iron being inserted in the second brick from each end. The upper brick broke, carrying with it also a part of the lower weight, 4,600 lbs.

11. Two pieces of Portland stone, 2 feet by  $11\frac{1}{2}$  inches,  $7\frac{1}{2}$  inches thick, neat cement joints. The lower stone broke, carrying away a very small portion of the cement joint; weight 7,272 lbs.

The last five experiments (Nos. 7 to 11) were performed on the 23rd September, in the presence of General Sir Charles Pasley, C.B., Professor Wappler, of Vienna, and other scientific gentlemen, by the two former of whom the above statement is attested.

The Jury have great satisfaction in placing these experiments on record as among the results of the Exhibi-

tion. They cannot fail to be regarded with much interest by every one connected with engineering and the arts of construction, and, combined with what was before known on the subject, they fully prove the value of the peculiar material known as Portland cement, and its great advantage over the Roman or Parker's cement. There can be little doubt that the mud of many rivers running over soft calcareous rock, and containing also a large percentage of clay, might be used with advantage, as well as the mud of the Medway; but it yet remains to determine the true chemical cause of the great difference observable in similar proportions of calcareous and argillaceous matter for the purposes of cement, and till this is done, it can hardly be expected that artificial cements will exactly replace those which occur naturally, and whose value has been proved by experience.

Although it did not form one of the subjects of the experiments instituted before the Jury to prove the resistance of Portland cement to crushing weights, it may not be out of place to add here the results of experiments on this subject.

A block of neat Portland cement, manufactured by Messrs. Robins, Aspdin, and Co., thirty days old, measuring 18 inches  $\times$  9  $\times$  9, was tested by a Bramah's hydrostatic press, and is said to have withstood a pressure of 41 tons for upwards of a minute, when it broke up with a report.

A similar block, of one part cement and one sand, twenty-eight days old, crushed at 108 tons. Another, four sand and one cement, at 45 tons; and another, nine sand and one cement, crashed at  $4\frac{1}{2}$  tons.

A small piece of neat Portland cement, exposing a surface of  $1\frac{1}{2}$  inch by 1 inch, and six months old, withstood a pressure of 40,320 lbs., while a piece of Portland stone of the same size crushed at 2,576 lbs.

D. T. ANSTED, REPORTER.

London, October 1851

## CLASS XXVIII.

## REPORT ON MANUFACTURES FROM ANIMAL AND VEGETABLE SUBSTANCES, NOT BEING WOVEN, FELTED, OR INCLUDED IN OTHER SECTIONS.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers, and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

## Jury.

DON JOAQUIN ALFONSO, *Chairman*, Spain; Director of the Conservatory of Arts, Madrid.

J. E. GRAY, F.R.S., P.B.S., *Deputy Chairman*, British Museum; Keeper of the Zoological Department, British Museum.

REV. GORHAM D. ABBOTT, United States; Spingler Institute, New York City.

A. J. BALARD, France; Member of Institute.

DR. E. LANKESTER, F.R.S., *Reporter*, 22 Old Burlington Street; Secretary to the Ray Society.

T. J. MILLER, 7 Millbank Street; Merchant.

G. PETERSON, Russia; Member of the Scientific Committee for the Administration of the Domains of the Empire.

T. A. WISE, M.D., 9 Prince's Gate, Hyde Park; Hon. East India Company.

## Associate.

NATALIS RONDOT, 1 Rue Fontaine, St George's, Paris; Late of the Embassy to China, &c., &c. (Juror, Class XXI.)

In commencing their labours, the Jury thought it advisable to divide themselves into Sub-Committees for the purpose of examining the various objects submitted to their attention. The subdivisions of the Class enabled them to do this with facility, and the following Sub-Juries were formed:—

The Chairman, DON JOAQUIN ALFONSO, M. BALARD, and Dr. LANKESTER for Sections A and B, including gutta percha and caoutchouc manufactures.

Messrs. GRAY, ABBOTT, and WISE for Sections B and C, including manufactures from various animal substances, as ivory, tortoiseshell, horn, &c.; and from vegetable substances, as wood, vegetable ivory, cork, &c.

Messrs. MILLER and PETERSON for Sections E and F, embracing manufactures of straw, and of a miscellaneous kind from various animal and vegetable substances.

Dr. LANKESTER and Dr. WISE were appointed to draw up the present Report. The avocations of the latter gentleman having called him from town, the drawing up of the Report devolved on Dr. Lankester. Each of the Sub-Juries was requested to furnish the Reporter with remarks upon the various objects in their Sections; and the Reporter is indebted for a large proportion of the general remarks on the manufactures in caoutchouc and gutta percha to M. BALARD.

The constitution of this Class is somewhat peculiar and exceptional. The necessity for its existence was felt in the fact that a large number of articles manufactured from vegetable and animal substances could not properly be included in the Classes which embraced either woven or felted materials. This was especially the case with the very numerous applications of caoutchouc and gutta percha to the production of articles of constant and increasing use. What is true generally of these substances was felt in relation to many things manufactured from such animal substances as horn, ivory, whalebone, &c., and the vegetable substances—cork, vegetable ivory, and cocoa-nut fibres. At the same time the Jury experienced some difficulty in defining what articles rightly belonged to their Class without trenching upon the domain of others. This difficulty had evidently been felt in the disposal in the Building of many of the objects exhibited, and one of their first tasks was to send to other Classes objects which had been placed in Class XXVIII., and which had appeared under this head in the Official Catalogue. They had also to examine other Classes for the

purpose of bringing objects into their own Class, which otherwise might have been overlooked. With all the other precautions taken by the Jury, it is to be feared that some objects properly belonging to their Class, from being placed in other Classes, or from not being in the Catalogue, have not received the attention they deserved. Especially have they felt that many articles exhibited in the Foreign Department, from being sent to the Exhibition after the awards were made, may have escaped the notice which their merits would otherwise have demanded.

In presenting this Report, the Reporter has adopted the plan laid down in the scheme of "Heads for Juries," published by the Royal Commission, each Section of the Class, where necessary, being treated of under the following heads:—1. General Remarks. 2. Council Medals. 3. Prize Medals. 4. Honourable Mentions. 5. Remaining Exhibitors.

## SECTION A.—MANUFACTURES FROM CAOUTCHOUC.

## § 1. General Remarks.

The existence of a milky juice in many plants, which flows from them when their tissues are wounded, is a fact that has been familiarly known from time immemorial. It is, however, only a matter of recent discovery that this milky juice characterizes certain families of plants. Although the great majority of plants which yield this juice in abundance are tropical, yet they are not without their European representatives. The spurge, dandelion, andcelandine of our road-sides are instances. The families of plants which furnish this milky juice in the greatest abundance are *Moraceae*, *Euphorbiaceae*, *Artocarpaceae*, *Apocynaceae*, *Cichoraceae*, *Papaveraceae*, *Campulacaceae*, and *Lobeliaceae*.

This juice, which is called by botanists "the milky juice," because it has an appearance similar to milk, has also the physical constitution of that fluid. It is an aqueous liquid, charged with soluble matter, in which float globules of a substance insoluble in water, and which are by their tenuity held in suspension in the liquid, but for which they have no affinity, in the same manner as butter is held in suspension by milk. From the difference of the refractive powers of these two substances, each of which, taken separately, would be colourless or transparent, arise the opacity and white colour of the two; hence the compound is properly called a "milky juice."

The analogies which this juice exhibits with the milk of animals and vegetable emulsions are seen in the manner in which it acts when left to itself. Run out into the air, received and preserved in close vessels, it separates itself into two layers, as milk itself would do. The watery part very soon has an insoluble part floating upon it, which collects together, and swims at the top as cream swims upon milk, and which forms nearly the half of the entire mass.

But with these physical resemblances the analogies cease. That which in milk and in emulsions produced from seeds collects on the surface of the aqueous liquor, is, properly speaking, a fatty body, containing oxygen in its composition, as they all do; while the kind of cream which swims upon the milky juice of the plants when left to itself, is one of the compounds of carbon and hydrogen which are found so frequently in organic bodies. The latter, when obtained for commercial purposes, bears the Indian name of *caoutchouc*.

This substance has long been known to the natives of both the Old and New World, in Hindostan and South America. It was not, however, till the expedition of the French Academicians to South America in 1735, that its properties and nature were made known in Europe by a memoir upon it by M. de la Coudamine. This notice excited little attention; and subsequently notices of this substance were sent to the French Academy in 1755 by M. Fresneau, and in 1768 by M. Macquer. At the latter end of the last century and the beginning of the present it was brought into this country in small quantities, where, on account of its being used for rubbing out black-lead pencil marks, it acquired the name of India-rubber.

Although, after its application to the water-proofing of garments, its consumption gradually increased, the importation into the United Kingdom in 1830 appears not to have been more than 50,000 pounds. In 1842 the import of this article had increased to between 700,000 and 800,000 pounds. Up to the present time the consumption of India-rubber has prodigiously increased; and one port alone in South America is said now to send to Great Britain nearly 4,000 cwts. annually. To the large consumption in the United Kingdom we must add that of America, where the application of caoutchouc has been much more general and successful than even in our own country.

The particular species of plants which are employed for procuring India-rubber are very numerous, and it is probable that many yield it which are not yet known to botanists. The tree which supplies most in Continental India is the *Ficus elastica*, a tree belonging to the order *Moracea*; it is exceedingly abundant in Assam. All the species of *ficus* yield caoutchouc to a greater or less extent in their juices, and even the common fig (*Ficus carica*) of Europe contains it. Species of *ficus* produce the caoutchouc brought from Java, and *F. radula*, *F. elliptica*, and *F. prinosides* are amongst those mentioned as affording a portion of that brought from America. Next to the *Moracea*, the order *Euphorbiacea* yields the largest quantity of caoutchouc. The *Siphonia elastica*, a plant found in Guiana, Brazil, and extending over a large district of Central America, yields the best kind of India-rubber that are brought into the markets of Europe and America. To another order, *Apocynaceae*, we are indebted for the caoutchouc which is brought from the islands of the Indian Archipelago. The plant which is the source of this substance in those districts is the *Ureocela elastica*, a climbing plant of very rapid growth and gigantic dimensions. A single tree is said to yield, by tapping, from 50 to 60 lbs. annually. Many other plants of this order yield caoutchouc, and of those given on good authority we may mention *Collophora utilis* and *Cameraria latifolia*, plants of South America; *Vahia gummiifera*, in Madagascar; and *Willughbeia edulis* in the East Indies. To this order belongs the cow-tree, or *Hya hya* (*Zabernanthea utilis*), of tropical America, which yields a milky juice that is drunk by the natives of the district in which it grows.

The caoutchouc, whilst it is in the tissues of the plant, is evidently in a fluid condition, but after its separation from the other fluid parts, its consistence becomes changed,

and it forms a solid mass similar, in its external characters, to vegetable albumen. In this state it is dense and hard, but may be separated and rolled out so as to form a sheet resembling leather. It has many interesting and peculiar properties. Insoluble in water and in alcohol, it dissolves in ether, in the sulphuret of carbon, the fat oils, and the liquid carburets of hydrogen.

It is soft and elastic at the ordinary temperature, but at the temperature of 2° above the freezing point it acquires the hardness of wood. A temperature of 100° softens it without altering its form. It then unites with itself with the greatest facility, and two pieces recently cut apart reunite so as to render it impossible to discover where the junction has taken place. But a higher temperature, approaching 150°, changes it into an adhesive substance, which, on cooling, does not recover the primitive properties of caoutchouc.

In this state of recent coagulation, and while still in a pulpy condition, caoutchouc possesses a degree of plasticity which admits of its receiving, by means of moulds, the most varied forms.

The greater part of the caoutchouc of commerce is obtained by the natives of the countries in which it is produced, in the form of shapeless masses, collected at the foot of the tree which has been incised or cut, for the purpose of extracting the juice from it, or solidified in a trench made in the earth, and coagulated in this rude mould in voluminous masses, which often resemble the trunk of a large tree. A part of it, however, possesses other forms, which the rude art of the natives attempts to communicate to it. They model, with plastic clay, figures of animals, imitations of the human foot, and pear-shaped bodies, and then dipping these moulds in the thickened caoutchouc, and renewing the connexion when the first coat is solidified by exposure to the air, they obtain, by breaking the mould and getting it out in fragments through an opening properly arranged, hollow flasks, figures of animals, rough slippers, &c. They thus make caoutchouc serve for the manufacture of objects for which we ourselves employ animal membranes and leather.

Caoutchouc is obtained from both the Old and New World. The East Indies furnish caoutchouc, of which numerous specimens have been exhibited in the Crystal Palace by the East India Company. This caoutchouc, which comes principally from Java, is often glutinous, and is less esteemed in commerce than that furnished by the equatorial regions of America. Great quantities of caoutchouc are imported into Europe from Mexico, from South America, and especially from the province of Para, in Brazil. That which comes in the shape of bottles is generally preferred, and when it is pure, and the different coats which comprise it are well united, it may be employed immediately for many purposes. But it often happens that the coats which form the pear-shaped masses are badly united. It then becomes necessary, in order to make use of them, to work it up by a process of kneading, so as to obtain it in a coherent or homogeneous mass. This operation, becomes especially indispensable when, as most commonly happens, the caoutchouc is in large impure masses, and mixed with sand and the debris of vegetable matter. These impurities do not entirely proceed from the moulds made in the earth, into which the juice has been allowed to exude, and in which it has been left to thicken and solidify, but their quantity and their presence between the coats of the pyriform masses show that the impurity is mainly to be attributed to fraud. The caoutchouc thus obtained is not applicable to any use until it has undergone a previous purification.

The purification of the caoutchouc is accomplished by submitting the impure caoutchouc to the action of cylinders furnished with teeth turning in opposite directions and with unequal velocities, which cause it to undergo a kind of mastication. If the matter which renders the caoutchouc impure adheres very closely when dry, this property is lost when it is moistened. From this it happens that, by causing a small jet of water to flow into the apparatus, these foreign matters, crushed by the mill, are carried off by degrees, and the purified portions of caoutchouc unite the one with the other. By the subsequent

exposure of these masses of purified caoutchouc to a second mastication, but performed dry, they are softened by the heat evolved during the forcible compression to which they are then submitted. In this treatment the caoutchouc becomes softened without being liquified, and a homogeneous mass is formed which is cut in the form of rectangular blocks.

These are again placed in casting moulds, in which they are powerfully compressed, until they are completely cooled, when it is found that the pressure has freed them from cavities, air-bubbles, &c. By submitting them to the action of knives moved very rapidly by a mechanical action, and the edges of which are constantly kept wet by a thin jet of water, the caoutchouc is cut into sheets of various thicknesses, which, subdivided in their turn, constitute those small parallelopipedons used by draughtsmen to rub out the marks of black-lead pencils.

This use of caoutchouc was, in England, for a long time the only one to which it was applied; but this limited use was far from indicating the extent to which caoutchouc has been employed in the last thirty years, or the multiplicity of services it has been called upon to perform for sanitary and industrial purposes. To rub out pencil marks, to form the rude slippers which seemed well adapted to the Indian toilet, but to which a form acceptable in Europe had not been imparted, were, in fact, the only uses to which caoutchouc was applied up to 1820. In England was discovered the art of stretching it into thin sheets, and thus making it available for the production of waterproof fabric. In France was discovered the art of drawing it out into delicate threads for the manufacture of elastic tissues. We are indebted to Messrs. Mackintosh and Hancock for the application of caoutchouc to the rendering tissues waterproof, and for the manufacture of those garments which throughout the world have rendered unquestioned service to the cause of health, and have made the name of one of their inventors so justly popular.

The garments called Mackintoshes are well known. They are formed of fabrics covered on one side with caoutchouc, or two fabrics are united by the caoutchouc between. They are thus rendered impermeable to water, but at the same time they possess a flexibility such as it had never been possible to obtain by the employment of other varnishes. For the purpose of obtaining the sheet of caoutchouc sufficiently thin for this purpose, it is dissolved. The solid carburets of hydrogen are soluble in the liquid carburets, and for this purpose spirits of turpentine and the volatile products of coal tar were first employed. But after having obtained this solution, it was necessary to evaporate a great quantity of it for the purpose of obtaining a coating of caoutchouc, which at first occupying a great space, should be reduced to a small one when the drying was complete. For the purpose, however, of economising the solvent, a method is employed of kneading the caoutchouc, by means of powerful machines, with the spirit of turpentine or naphtha, and impregnating it with the menstrua without dissolving it, and softening it without making it a liquid; the caoutchouc rendered pulpy, is then spread upon the cloths by means of a flattening mill, and the process of evaporation is thus dispensed with. Waterproof garments were thus rendered cheap and available for the use of every class. This description of garment, nevertheless, presented a notable fault which was not avoided until a later period, and which arose out of the properties inherent in the caoutchouc itself. This substance, which in ordinary circumstances possesses very great elasticity, such as to justify the name by which it is designated in France, *gomme elastique* (elastic gum), loses this elasticity when exposed to a temperature near the freezing point of water, and this suppleness, which might almost cause a sheet of caoutchouc to be mistaken for an animal membrane, gives place all at once to the rigidity exhibited by the same membrane when dried. This property, which in cold weather was a great defect, when applied to fabrics rendered waterproof by caoutchouc, has been found very useful in the making of garters, braces, and other articles in which the elasticity of the caoutchouc has been brought to supersede that which had, until then, been obtained by

the employment of spiral metallic springs. In order to obtain the threads which are used for the manufacture of elastic tissues, either the flasks of caoutchouc in its natural state, cut in half and flattened by pressure, or else those masses of purified caoutchouc which are sold in continuous sheets, cut by knives, wetted by a small jet of water, are employed. These sheets are divided into thongs; the latter are afterwards subdivided into very narrow bands, which serve in their turn to produce the threads employed for the manufacture of the tissues. If by a slight elevation of temperature the natural elasticity of the caoutchouc is increased, these narrow bands can then be stretched into threads of great length by drawing them out and rolling them upon bobbins. But it may be well conceived that the management and weaving of the threads would be very difficult if they retained their elasticity. Fortunately the particles of the caoutchouc eventually accommodate themselves to the forced position which they have been made to assume, and the exposure to a low temperature materially hastens this result. The threads having thus lost their elasticity can then be introduced like common threads into the fabrication of stuffs; they can be covered with a different thread, by winding spirally round them cotton, silk, &c., and this compound thread may be in its turn introduced into the composition of new tissues. In all these operations the caoutchouc has retained all its rigidity, but that elasticity of which it has been deprived by a long distension and a low temperature, can be restored to it by means of a proper degree of heat. The stuff thus woven is exposed to a temperature of from 140° to 160° Fahrenheit by the passage of a hot iron, when each thread resumes with its primitive length the diameter which it first possessed. The fabric diminishes in length without increasing in width. The tissue is thus compressed, and the caoutchouc, which has regained its elasticity, communicates it in a permanent manner to these tissues. The manufacture of these threads of caoutchouc constitutes at present a distinct branch of industry from that which, making use of them either in an uncovered state, or covered with silk and cotton, combines them with ordinary threads in the way of weaving; and, like the manufacturers of linen or cotton fabrics, the makers of the elastic tissues buy the threads of caoutchouc in bobbins of different numbers. When the limited lengths of the narrow bands from which these threads are manufactured is borne in mind, the necessity is foreseen of being able to unite them end to end for the purpose of making continuous threads. A remarkable property of caoutchouc renders this easy. It unites with itself with the greatest readiness if it be the least warm; and two surfaces recently cut with a very sharp instrument, may be made to adhere together by means of pressure, with a cohesion equal to that which unites the other parts of the same thread. But although in this case this property is made useful, in other instances the limited elasticity, and the rigidity communicated to it by a low temperature, are great drawbacks.

However, all these properties inimical to its use disappear in that combination of sulphur with caoutchouc called vulcanized India-rubber, which exhibits such special properties as to form in some degree a new substance. This transformation of caoutchouc was first applied to practical purposes in America.

While in England the employment of caoutchouc was being developed principally in regard to the rendering of cloths waterproof, and in France its elasticity was being made available for the manufacture of certain tissues, it was turned to account in America for waterproof shoes, by making use of the processes discovered by Mr. Charles Goodyear, who, since 1836, had been engaged in the discovery of means for making use of caoutchouc, with a skill and perseverance which have borne the most happy fruits. It is not that attempts at fashioning according to the European taste, and thus rendering useful the Indian shoe made of caoutchouc, had not been frequently made in Europe, but these attempts had hardly been successful in giving them acceptable forms, and the stiffening by cold rendered them very inconvenient. However, Mr. Goodyear at last succeeded in making shoes of raw India-rubber purified, and perfectly free from objection, thus

completing by the manufacture of waterproof shoes the service which Mackintosh had begun by the invention of the garments which bear his name. Since 1842, Mr. Goodyear has imported into Europe shoes which possess an unlimited and permanent elasticity, and which resist cold; two of their surfaces may be pressed against each other without the least adhesion taking place. These are precisely the remarkable qualities which characterize that caoutchouc which is called in the present day vulcanized India-rubber. Impressed, perhaps, with the idea, too often moreover a just one, that the specification of a patent is sometimes nothing more than the occasion of attracting the attention of imitators, Mr. Goodyear took no patent for this article, but he endeavoured in Europe to take advantage of his discovery, by communicating it as a process of which he alone possessed the secret, which might be lost to mankind and disappear with its sole possessor, when Mr. Thomas Hancock, of Stoke Newington, who had been engaged in Europe in the working of caoutchouc with no less perseverance and success than Mr. Goodyear in America, discovered anew the process of the vulcanization of India-rubber, and secured it by a patent, which Mr. Goodyear afterwards demanded for the same subject. Mr. Thomas Hancock discovered, that a band of caoutchouc dipped into melted sulphur, and impregnated with this substance, without losing any of its properties, only required to be afterwards exposed to a temperature of about 300° Fahrenheit, to acquire properties entirely novel, which were precisely those possessed by the material employed by Mr. Goodyear for the waterproof shoes.

This was, as may be seen, a new discovery of a fact already known—a novel solution of a problem which was known to be soluble, since it had been already solved. This discovery must, however, have presented its difficulties, and required also the fortuitous co-operation of favourable circumstances. For though analysis might have pointed out to Mr. Hancock the existence of sulphur in the productions of Mr. Goodyear, and have also disclosed the presence of the salts of lead which the latter had deemed indispensable, it could not in any manner give him a clue to the discovery of the essential condition of this transformation, that is to say, the employment of a given temperature which alone was able to impart to the mixture of caoutchouc and sulphur, the new properties which appeared to make of it an entirely new body.

Whatever may be the share of merit assigned to Mr. Goodyear and to Mr. Hancock in this important invention, the latter has not the less exclusive merit of having discovered that sulphur was the sole cause of the vulcanization of India-rubber. On seeing Mr. Charles Goodyear introducing the different salts of lead into the specification of the patent which he subsequently took out, it is felt that he regarded their intervention as indispensable, while it is now demonstrated that sulphur alone is sufficient; if other substances are employed in certain cases, it is not so much to aid in the vulcanization of the caoutchouc as to add to its weight and solidity.

The vulcanization of India-rubber is an easy process. The India-rubber, softened by the heat evolved when it is being kneaded by strong machines, is mixed with the sulphur in the masticating apparatus already alluded to. This mixture retains all the solubility of the caoutchouc in the different menstrua,—the property of becoming hard at a low temperature as well as that of uniting with itself; but as soon as it is exposed to a temperature of 300° Fahrenheit,—a temperature which would have sufficed to change the pure caoutchouc,—the matter acquires new properties. It is no longer soluble in the menstrua which dissolve caoutchouc, but is impregnated with them by contact, and swells out like an animal membrane that is moistened with water; resuming its primitive properties on being dried. It no longer becomes rigid when exposed to cold, nor does it unite with itself, and it resists without any alteration a temperature which would have sufficed to transform the ordinary caoutchouc into a sticky matter; it is, in short, vulcanized India-rubber. This absence of the tendency to adhesion is so decided, that in actual manufacture no use whatever can be made of the shavings of the caoutchouc thus modified,

and the means of separating the sulphur and reproducing the pure caoutchouc presents at the present day an important problem to solve. If this action of heat which modifies the caoutchouc is exercised upon a mixture enclosed and compressed in a mould, the material then acquires a form which the indefinite and permanent elasticity of the vulcanized India-rubber causes it to retain.

This sulphurization of the India-rubber, instead of being produced with free sulphur, may be obtained with sulphur in a state of combination, as with the chloride of sulphur. If articles of common caoutchouc are immersed for one or two minutes in chloride of sulphur, diluted in 50 or 60 times its weight of sulphuretted carbon, they acquire by exposure to a proper temperature, all the properties of vulcanized India-rubber. In commerce this caoutchouc is designated by the name of *converted* caoutchouc.

From the moment in which the vulcanization of India-rubber was known, all the inconveniences which ordinary caoutchouc presented having disappeared, its employment received an extension which is continually increasing, and each year sees new applications of this product spring into use. The enumeration of the objects exhibited by the two manufacturers to whom this branch of manufacture is the most indebted, Mr. Goodyear, in America, and the firm of Mackintosh, in Europe, will tend to show how widely spread, and how varied the use of this material has already become.

### § 2. Council Medals.

1. CHARLES MACKINTOSH and Co.; 73 Aldermanbury (76, pp. 782, 783). The firm of Charles Mackintosh and Co. comprises the names of the men who in Europe have made the most useful discoveries in the art of applying caoutchouc to the most varied uses:—the late Mr. Mackintosh, who gave his own name to the waterproof garments, and Mr. Thomas Hancock, whose share of merit in the discovery of the vulcanization of India-rubber we have already mentioned. In going through the collection of articles exhibited by this firm, the importance of the uses to which the substance is capable of being applied, especially since the discovery of the process of vulcanization, can be readily appreciated.

The kinds of fabrics with which the garments called Mackintoshes are manufactured have always remained the same, but the garments themselves have acquired more lightness and less smell, and the substitution of vulcanized for common caoutchouc insures to them at the present day a permanent suppleness.

The other services which these fabrics are called upon to perform, have been greatly multiplied. Their price having become less, they are capable of being applied in lieu of tarpaulings for covering waggons, carriages, &c. The property which they possess of serving to retain water, and which had at first been made available for a well-known therapeutic use, has allowed of their being made into portable baths, which can be rolled up like an ordinary cloth when not in use. The shoes exhibited by Messrs. Mackintosh and Co. are made with much care, and with a degree of elegance which shows that in Europe these articles are but little used except by the more opulent classes.

It is not only in the making of shoes that India-rubber has been called in to supersede leather; the articles exhibited by Messrs. Mackintosh and Co. show the use that can be made of it to form pistons of pumps, and how conical valves of India-rubber can be advantageously substituted for leather or metal ones. Sheets of caoutchouc of different colours, either smooth or worked in relief, are brought in to supersede moulded ornaments in the manufacture of furniture, of ottomans, and in the binding of books.

The use of vulcanized India-rubber to form the piston-valves in steam-engines on the screw principle, has greatly contributed to the employment of these novel motive powers, which are destined in some degree to effect a change in navigation by allowing steam to come in solely as an auxiliary to the wind. The exhibition of Messrs. Mackintosh and Co. comprises a valve of this description, which after six months' use has undergone so little alter-

ation that it may be foreseen that these articles possess an almost unlimited durability. The rendering available the impermeability of their fabrics to air and gas has likewise been extended. To the air-cushions which have been long used are now added the air-mattresses, so well adapted as beds for travellers and invalids; boats inflated with air, at once portable and incapable of sinking, and which for life-boat uses and in inland voyages are capable of rendering great service. The collection of Messrs. Mackintosh presents some specimens of this kind of great interest. Lieut. Halkett, of the Royal Navy, by making them in several closed compartments in such a manner that the stuff being pierced through at one point cannot lead as a necessary consequence to the sinking of the boat, has rendered more certain the services which these machines are called upon to perform. The applications of the elasticity of caoutchouc have also been greatly increased. The wheels of carriages have been surrounded by it in such a manner as to prevent the disagreeable noise which they make upon the pavement. Rollers for inking printing types and lithographic stones have been made from it; it is employed for the making of cushions for billiard tables, and to supersede the use of sack-cords in bedsteads. Advantage has been taken of the elasticity of an India-rubber band, which has a tendency to return to its primitive length when the action of opening a door has elongated it, for the purpose of forming door-springs, the use of which is beginning to spread widely.

The force with which caoutchouc untwists itself, when it has been twisted, has caused it to be employed in the mechanism of window-blinds.

A thin tube of India-rubber, of tolerably large diameter, but flattened at the bottom, so that it terminates in two flat edges, which the elasticity keeps in juxtaposition, constitutes an apparatus of extreme simplicity which perfectly supersedes ordinary hydraulic valves. The edges which are in contact below open by the pressure of any liquid passing through the tube, and close when the liquid has run out, thus preventing any foetid gas escaping from below. The elasticity of India-rubber has made a ring of it applicable for uniting cast-iron or earthen tubes used for the conveyance of water. This indestructible and moveable tube, which admits of widening and allows the pipes to slide one within another, presents a method of fitting which seems destined to render notable service in the conveyance of water in large towns.

A thin hollow sphere of India-rubber, terminating in an appendage in the form of a tube, introduced in a flaccid state into an opening accidentally made in gas or water-pipes, may by means of being expanded by inflation, be used to press upon the sides of these pipes, and thus present a method of occlusion of great simplicity, which will allow these pipes, which it has become necessary to replace, to be removed without inconvenience.

Mr. Richard Edward Hodges has lately proposed to make use of cords of vulcanized India-rubber as a means of rendering its elasticity serviceable in raising weights, and has offered by the use of different cords, which are to be stretched successively, and then released all at once, a method of throwing projectiles, and especially harpoons, with increased force. This invention is as yet too new for any one to be able to judge of it by experiments on a large scale. The source of power in this application of India-rubber presents a curious physical problem, as it is evidently not at once reducible to the other powers of mechanical force.

The substitution of vulcanized India-rubber for metallic springs in the buffers of locomotive-engines, is one of great service. The masses of vulcanized India-rubber deaden the shocks with an ease which may cause this employment of caoutchouc to be considered as one of the most useful to which it has been applied up to the present day.

A certain number of the novel applications are due to Messrs. Charles Mackintosh and Co. The ability which they have displayed in the manufacture of caoutchouc has afforded to other inventors of these new applications the means of putting their ideas into practice. Without the discovery of vulcanized India-rubber they could,

moreover, never have been carried out. The Jury, therefore, in order to recompense the considerable services rendered in the employment of caoutchouc by Messrs. Mackintosh, Hancock, and their other partners, have awarded a Council Medal to the firm of Charles Mackintosh and Co.

2. CHARLES GOODYEAR, Newhaven, Connecticut, United States (378, p. 1461). Mr. Charles Goodyear, of Newhaven, Connecticut, exhibits a very remarkable collection of productions in caoutchouc, manufactured in the United States in numerous manufactories by processes which are his own, and for which he has patents in his own country.\* The eighteen to twenty licenses granted by Mr. Goodyear for the use of his processes, and a capital of more than 2,600,000*l.* expended in the establishment of his manufactories, attest the importance which this branch of manufacture has attained in America. Mr. Goodyear exhibits in his collection a number of articles of the same kind as those manufactured in Europe, whether with vulcanized India-rubber alone, as springs for waggons, elastic maps, balloons, sponge-bags, tobacco-pouches, or with India-rubber covered upon one or both sides with stuffs of various natures, uniting together two fabrics by a coating of waterproof material, according to the processes originally employed by Mr. Mackintosh. In the manufacture of air-cushions and mattresses, and especially in that of waterproof garments, more strength and greater thickness are to be remarked than in the articles manufactured in Europe, but with less finish in the workmanship and less elegance in the forms. It may be thus clearly seen that these articles, which are as yet only used in Europe as objects of luxury or of more refined comfort, have already in America entered into general consumption, and become, by their price, within the reach of the least opulent classes, to the tastes and wants of which the manufacturer has been compelled to accommodate himself. Providence has given us in caoutchouc a species of natural leather, plastic and impermeable to water, and which is especially adapted to increase the well-being of that class of workmen, the nature of whose occupations compels them to encounter the inclemency of the atmosphere. In the manufacture of these articles it is, therefore, of importance that the resources and requirements of individuals of this class should be kept in view. Besides these articles common to the manufactures of America and of Europe, Mr. Charles Goodyear exhibits a series of productions which have interested the Jury in a high degree by their novelty, and which promise to become the object of numerous and novel applications.

The ordinary cloths covered with India-rubber present a great resistance when they are pulled in the direction of the fibres, but they tear with great facility if they are made to undergo a traction tending to separate the threads united by the weaving. This is an inconvenience which might stand in the way of some of their uses, and against which Mr. Goodyear has succeeded in providing by the fabrication of a species of stuff or felt, which he manufactures by machines of his own invention. This stuff, formed in successive layers and in variable numbers of threads crossed in different directions, constitutes a species of regular felt obtained by mechanical means, which can be produced at a low price, and is capable of supporting a traction in any direction.

By covering these stuffs, formed of three, four, and even five and six coats of entangled threads, with a thin coat of India-rubber in a pulpy state, which, penetrating into the interstices of the fibres, still further increases their adhesion, Mr. Goodyear is enabled to obtain extended surfaces of a species of resisting and waterproof paper—a real vegetable parchment of which he has been able to make excellent use in most advantageously superseding paper itself as a material for covering damp walls; as a material, moreover, very well adapted for printing upon, and therefore to the making of large maps for walls, also of the globes and celestial spheres of large dimensions which are employed in teaching cosmography or geography. By covering with this waterproof fabric a species of woollen wadding, he has been enabled to produce garments at once warm and waterproof, remarkable

for their lowness of price, and especially for their lightness, which much surpasses that of the ordinary Mackintosh. By covering this same stuff, rendered adhesive, with cotton fabrics, he has been able to employ it in making table-covers. Made to adhere to a thick woollen down it can be employed to cover the ground in such a manner as to keep off cold and moisture, and constituting a new species of carpet which is beginning to be substituted in the United States for the floor coverings of oil cloth used in low and damp places. Mr. Goodyear, by covering with two layers of a felt of this description the two sides of rough canvas, has been able to unite in this combination the advantages of impermeability with those of greater resistance to mechanical action, and thus economically to obtain cloths adapted to the manufacture of sails, and to the coverings of carriages and merchandise.

With this kind of complex stuff are made, at the present day in the United States, the apparatus for life-boats, the insubmersible boats, as well as those pontoons inflated with air, which were first constructed by Mr. Armstrong, of New York, and which, by simplifying certain equipments which the armies were compelled to carry with them, have already rendered service to the United States in their war with Mexico.

It is well known that the application of India-rubber to the manufacture of shoes was in a more especial manner the object of the first researches of Mr. Goodyear. These shoes are of three sorts. Those of one sort are formed of a layer of caoutchouc, covering a woven and non-elastic fabric; these common shoes appear to be universally employed in the United States. Others, produced by a layer of caoutchouc spread upon a knitted, and therefore an elastic fabric, are more commodious in use, their elegant shapes leaving nothing to be desired. This kind of fabric has also been made use of for the manufacture of gloves, which, proof against water, lyes, &c., allows the mistress of the house in humble families and her children to apply themselves to the most lowly household cares without giving up a certain degree of elegance, and without destroying the whiteness of the hands.

Mr. Goodyear has, in addition to these, exhibited a few specimens of a third species of shoe, of entirely new invention, which is made with a sheet of caoutchouc pierced through with an infinity of very small holes. These shoes, which by reason of the resistance of the India-rubber to moisture, and of the extreme smallness of the holes, are impermeable to water, but pervious to gases, possess the double advantage of being waterproof in regard to external moisture, while they nevertheless admit of the dissipation of the moisture arising from perspiration. This condensation of the moisture of perspiration is a serious inconvenience inherent at the present day in the wear of India-rubber shoes, and of the ordinary Mackintoshes. These inconveniences may be entirely removed, without the advantages being diminished, by the employment of the thin pierced sheets of India-rubber exhibited by Mr. Goodyear.

In the multiplicity of objects to which caoutchouc has been lately applied, it was proper that childhood should have its share. Mr. Charles Goodyear has conceived the happy idea of fashioning the mixture of sulphur and caoutchouc, constituting vulcanized India-rubber, by heating it in moulds. He is thus enabled to produce dolls' heads, different figures of animals—in a word, toys of every description, which are indestructible by falls, shocks, and moisture, and which, while contributing to the pleasures of childhood, only deprive it of that of destroying.

It has been already seen how Mr. Charles Goodyear had in America, since the year 1842, worked in caoutchouc, to which the addition of sulphur and carbonate of lead had imparted the greater elasticity. By combining caoutchouc with sulphur and magnesia he has latterly succeeded in imparting to it the rigidity and hardness of wood, but of a plastic wood, and therefore susceptible of being produced from moulds in the most varied forms. This material, like India-rubber itself, is capable of receiving different tints; and by partially mixing the

differently coloured masses, he has been able to produce shaded specimens, which are beginning to be substituted for horn in the manufacture of buttons, and of handles for penknives and table-knives, and which rolled out into thin sheets are adapted to take the place of wood in the veneering of furniture. Although this invention is as yet a recent one, there is good reason to suppose that it will very soon bear its fruits. By varying the preparations of sulphur and magnesia combined with the caoutchouc, it has already been made to attain different degrees of consistency; and probably in a short time industry will be able to discover in this substance, so indestructible, all the degrees of cohesion that solid matter exhibits in its most varied states. This enumeration of the articles shown by Mr. Goodyear at the Great Exhibition, incomplete though it is, nevertheless suffices to indicate the extent of the services which he has rendered to the art of applying India-rubber to the most diversified uses, and justifies the high distinction he has obtained, as well as the award which the Jury make to him of a Council Medal.

### § 3. Prize Medals.

1. THE HAYWARD RUBBER COMPANY, Colchester, Connecticut, United States (294, U. S. p. 1453). The manufacture of waterproof boots and shoes is one of the principal uses of India-rubber in the United States. The manufacturers who make them supply a consumption of from three to four million pairs every year. One single establishment, that of the Hayward Rubber Company, manufacture as many as 3,000 pairs a-day: they employ in it the process invented by Mr. Goodyear. These boots and shoes have attracted the attention of the Jury. They possess the double merit of being well made and of elegant appearance. The considerable number in which they are made must have a tendency to lower their price. The Jury award a Prize Medal to the Hayward Rubber Company.

2. J. WANSBOROUGH, 52 Little Britain, London (75, p. 782). Mr. Wansborough has exhibited a new description of waterproof fabric, produced by a method which calls to mind the manufacture of the stained papers called velvet papers. By covering an ordinary fabric of thread or cotton with a coat of glutinous caoutchouc, and then causing to adhere to it the wool powder coloured in different shades, which is so abundantly obtained in the shearing of cloth, he has been enabled to produce a fabric resembling velvet, which is strong and waterproof, and which, for the manufacture of travelling hats, curtains, travelling bags, &c., is capable of receiving numerous applications. The Jury have rewarded Mr. Wansborough's invention with a Prize Medal.

3. S. C. MOULTON, New York (534). Mr. Moulton exhibits some articles in India-rubber prepared in England, principally by Mr. Goodyear's processes, and which have appeared to the Jury to be well made. They have particularly noticed some waterproof fabrics which Mr. Moulton exhibits as having been produced by machinery and without dissolving the caoutchouc, a method, the result of which is to obtain waterproof fabrics entirely free from the disagreeable smell which they often possess. Amongst the very numerous objects comprised in Mr. Moulton's collection, the Jury have especially noticed some half clogs, the same as those shown in the American Exhibition, but made with greater elegance, and which, being easy to put on with a common shoe, easy to take off, and of a tolerably low price, seem to exhibit the form in which these articles (the utility of which is every day better appreciated) may be best extended in Europe, and more generally employed there. The Jury have also noticed some articles of saddlery which exhibit a new application of vulcanized India-rubber, in superseding the leather usually employed in their manufacture. The Jury award a Prize Medal to the ensemble of Mr. Moulton's manufactures.

4. GROSMANN and WIGNER, 11 Rue de Renard St. Sauveur, Paris (France, 856, p. 1221). India-rubber, which so much resembles leather in its properties, nevertheless lacks an essential quality which is one of the characteristics of leather, its tenacity. It will be understood,

therefore, what great advantage would arise in uniting together two substances, the qualities which should in some degree complete each other. Amongst the different articles of Messrs. Grossmann and Wagner's manufacture which have attracted the notice of the Jury, they have remarked some shoes in which these manufacturers have realized this union. These shoes, the soles of which are of leather, possess greater durability than those which are entirely made of India-rubber, and have not the defect of slipping upon the pavement. The Jury have rewarded the manufacture of Messrs. Grossmann and Wagner, and especially the perfection to which they have brought India-rubber shoes, with a Prize Medal.

5. THOMAS FORSTER, Streatham, Surrey (178, p. 787). Mr. Forster exhibits some waterproof garments of good make. These garments, in which the especial object has been to render them more accessible to the less opulent classes, are produced by means of the combination of ordinary caoutchouc with certain resinous substances, which are moreover added in suitable quantities so as not to interfere with the suppleness or the flexibility of the fabric. Mr. Forster produces articles in the coloured paste of India-rubber, which he was the first to bring into use. The good quality of these fabrics made by Mr. Forster has been proved by long use. The Jury award him a Prize Medal.

6. CHRISTOPHER NICKELS and Co., 13 Goldsmith Street, Cheapside, London (78, p. 783). The manufacture of elastic tissues constitutes one of the most important uses of India-rubber. Messrs. C. Nickels and Co. devote themselves with much success to this special manufacture. They exhibit a collection of articles of this description proceeding from their factories, which show of how great a variety this species of weaving is susceptible. The elastic tissue serves no longer solely for the manufacture of garters, braces, and belts; it is applied to the manufacture of gloves, sandals, elastic cords, and other articles of the same kind, of which Messrs. C. Nickels and Co.'s exhibition contains a complete collection. The Jury award them a Prize Medal.

7. M. LEUNENSCHLOSS, Rouen (313, p. 1192). The manufacture of elastic tissues, which had its birth in France, has received in that country a great degree of development. It comprises the numerous fabrics of this description of productions, a few of which are represented at the Great Exhibition. The Jury have especially noticed the productions of this nature which are exhibited by M. Leunenschloss, and which are worthy of the reputation which this manufacturer has deservedly obtained. He is moreover the author of several ingenious inventions, which have rendered this manufacture more easy and regular. The productions which he exhibits in ~~braces and laces for tailors' and ladies' use~~, are remarkable for their good quality and their elegance. The Jury award a Prize Medal to M. Leunenschloss.

8. Messrs. HÖLTING and HÖFFNER, Barmen (1 Zollv. 662, p. 1086). The collection of braces exhibited by this firm presents a series of articles, in which the threads of elastic tissue are employed for one of their most useful applications. The workmanship and appearance of these articles also entitle them to commendation.

#### § 4. Honourable Mention.

1. Messrs. BUNN and Co. (77, p. 783). A very extensive and interesting collection of specimens of the various descriptions of India-rubber, more especially from Para. Also specimens of gutta percha, and examples of the processes to which these substances are submitted in their preparation for application in the arts.

2. W. H. BURKE (Class IV., 145, p. 204\*). Specimens of India-rubber web manufactures of various kinds. These consist of tissues of alpaca, mohair, and Genappe braids, covered with caoutchouc on one side, and having a peculiarly light and elegant character. The exhibition comprises also specimens of "mineralized India-rubber," having the same properties as vulcanized India-rubber, and prepared with the object of avoiding the smell of the sulphur used in its preparation.

3. Messrs. CHURCH and CHITTENDEN, United States (382, p. 1461). A collection of shoes made of India-

rubber, in a style which enabled the makers to sell them at a low cost. This is one of the establishments in America registered under Mr. Goodyear's patent.

4. J. C. COADINE, United Kingdom (82, p. 783). A variety of articles of dress made of various fabrics, and rendered waterproof by caoutchouc. The articles included coats which might be worn with either side outwards, also ladies' capes and hoods.

5. R. E. HODGKINS, United Kingdom (72, p. 782). Various applications of the elastic property of vulcanized India-rubber, as in mechanical purchases, guns, bows, &c.

The Reporter would also call attention to the caoutchouc manufactures exhibited by Mr. J. HORRER, of London, 188, p. 787, which contained several very elegant specimens of goods manufactured from vulcanized India-rubber, as also fabrics coated with caoutchouc of various colours, in which the colours were mixed with the caoutchouc and not subsequently applied, so as to prevent their being removed by wear or the application of moisture.

The ladies' and children's boots and shoes exhibited by Mrs. TALLERMAN (70, p. 782) afford an instance of a new and useful application of caoutchouc.

#### § 5. Remaining Exhibitors.

Under this head the Reporter has endeavoured to give a list of the names of exhibitors of various articles made of caoutchouc, or into which it enters, whether exhibited in Class XXVIII., or belonging to some other.

J. SANDERS, 11 Fore Street, Cripplegate (73, p. 782). India-rubber waterproof umbrella tent.

J. L. HANCOCK, Goswell Mews, Goswell Road (83, p. 783). Portable India-rubber shower-bath, hose-reel, and inflated air-tight bed chair.

S. MATTHEWS, 58 Charing Cross (81, p. 783). Large-sized India-rubber portable boat, and India-rubber cloak boat, designed by Lieut. Halkett, R.N. India-rubber portable bath.

C. JOUBERT, 8 Maddox Street, Hanover Square (Class XX., 40, p. 579). Self-adjusting white watered corset. Elastic corset belt for invalids. India-rubber tissue, of French manufacture.

J. S. HALL, 308 Regent Street (Class XXVIII., 184, p. 787). Improved elastic over-shoes, with leather soles and plush heels, to prevent slipping.

S. TURNER, Orchard Place, East India Docks (223, p. 142). Coal and its products. Products from caoutchouc and wood.

J. OUTRIDGE (29, p. 980). Caoutchouc from River Demerara, near the Falls. Milk from the cow-tree, from River Demerara.

W. HUET, Rouen (Seine-Inférieure), and 12 and 14 Rue du Cimetière, St. Nicholas, Paris (270, p. 1189). India-rubber articles, braces, and twists.

J. D. LEBLOND, Carver, 5 Rue St. Louis (au Marais), Paris (1301, p. 1239). Patent India-rubber male and female figures for artists.

C. L. DUBOURTIER, Caoutchouc Stocking Manufacturer, 4 Rue Fontaine au Roi, Paris (1199, p. 1235). Machine-made caoutchouc stockings and belts.

BRIGUET and PERRIER, Tissue Manufacturers, 22 Rue Jean Robert, Paris (1116, p. 1232). Elastic caoutchouc tissues for braces, garters, &c., and specimens of that manufacture.

— RABOURDIN, Manufacturer, 88 Rue des Marais St. Martin, Paris (1416, p. 1244). Braces; garters; silk and India-rubber fabric.

— LERHE, St. Petersburg (Russia, 311, p. 1376). Clogs in India-rubber, for ladies and gentlemen. Waterproof Morocco pillow.

H. H. DAY, New York (308, p. 1453). India-rubber manufactures.

J. J. ROMPLER, Erfurt (781, p. 1094). India-rubber elastic braces and watch-guards. Silk and half-silk shoe stuffs, mixed with India-rubber; shoes made of the same material.

ROOVACKERS and SON, Rotterdam, Makers (52, p. 1145). Boots; varnished boots, the leg without seam. A Chinese boot. Boots of vulcanized caoutchouc.

LOUISA PIERCE, Geneva (233, p. 1281). Caoutchouc knit stockings for invalids.

J. VIE, Caoutchouc Manufacturer, 161 Rue St. Jacques, Paris (726, p. 1213). Caoutchouc tissues, elastic stockings, belts, knee-caps, &c.

## SECTION B.—MANUFACTURES FROM GUTTA PERCHA.

### § 1. General Remarks.

The substance designated by the name of gutta percha (pronounced *per-tsha*), is, like caoutchouc, a carburet of hydrogen, and isomeric with that substance, and possesses a great number of the properties which characterize India-rubber, but exhibits certain special properties which admit of its being applied to particular uses to which caoutchouc is not adapted. Gutta percha possesses as great an indestructibility by means of chemical agents as caoutchouc. It has an intermediate consistence between that of leather and wood; it is capable of being softened by heat, and of regaining its primitive consistence on cooling. It is, therefore, at the same time capable of taking and of retaining the most delicate impressions. The important uses to which it has been lately applied are only the forerunners of those to which it will be adapted hereafter, provided the lack of this precious material (which unfortunately is produced in much less quantities than India-rubber, and in localities much more circumscribed) does not present an obstacle to it.

Whilst the plants which furnish caoutchouc abound in the whole of the territorial zone which extends between the tropics, the *Isanandra gutta*, belonging to the natural order *Sapotaceæ*, is the only tree which yields gutta percha. It grows scarcely anywhere except in certain parts of the Malayan Archipelago, and up to the present time has been almost exclusively obtained from Singapore. It was brought for the first time into England, in the days of Tradescant, as a curious product, under the name of *Mazer wood*, and subsequently it was frequently brought from China and other parts of the East, under the name of India-rubber, in the form of elastic whips, sticks, &c. In 1843, Doctors D'Almeida and W. Montgomery drew particular attention to it, together with its various singular properties, its easy manipulation, and the uses for which the Malays employed it. The most common employment of it was for whips: and it was by the introduction of a horse-whip made of this substance that its existence was for the first time known in Europe. The exhibition of the products of the East Indies, shown by the Honourable East India Company, proves that the natives of the country in which the *Isanandra gutta* grows, knew also how to appropriate it to the manufacture of different kinds of vases, and that European industry has little more to do than to imitate their processes.

The importation of gutta percha into England, where the employment of this substance first drew attention, was in 1845 only 20,600 lbs.; but in 1848 it had increased to above 3,000,000 lbs.; and during the last three years the importation has amounted to a much larger quantity, and one which begins to cause some apprehension as to the possibility of the supply sufficing for the requirements of the novel uses in store for it in the future. If it is true that during its use gutta percha is but little consumed, and the waste from the articles in this material, submitted to a proper softening, can be made to serve new uses; nevertheless its constantly increasing consumption, added to the barbarous manner in which the product has hitherto been extracted, may well justify some apprehension.

During the first few years of the employment of gutta percha, it was the custom to cut down the tree for the purpose of obtaining the juice, which, left to itself, very soon allowed the gutta percha to separate and coagulate of its own accord. There is reason to hope that European industry will soon be embarked in the cultivation of this product, and that the *Nioto* (which is the name that the Malays give to the tree which produces gutta percha), multiplied by means of a regular culture, naturalized in other countries than those to which it is indigenous, and worked by regular incisions, which will only take from the tree a portion of its juice without hindering its development, will be the means of furnishing at a low price

a substance which is destined to render notable services to industrial and domestic economy.

The gutta percha, which arrives in Europe in the form of lumps of some pounds weight, is far from being pure. The natives of the Malayan Archipelago make no scruple of introducing into it stones, earth, &c.; the presence of which in the interior of these blocks renders a purification indispensable, which purification, however, is capable of being attained without much manipulation.

Ever since its first introduction into Europe, gutta percha has, in fact, found everything provided for the purpose of cleansing it; and has been found capable of being worked by the processes and instruments which are employed in the purification of India-rubber. At the present day the block of gutta percha, cut into slices by a strong machine, is softened by means of hot water, divided and torn into shreds by the same machine that is used for India-rubber, which serves to knead the gutta percha in such a manner that the crushed stones and earth may be separated from it on being diluted in the water; it is then dried, and submitted, by means of a powerful machine, to a mastication similar to that which India-rubber is made to undergo; and when, after some hours of kneading, the mass has become homogeneous and sufficiently softened, it is drawn by the drawing-mill into cylindrical cords, into tubes of various diameters, or it is spread out by means of the flattening machine (as is done with lead) into sheets of various thicknesses, which are finally divided into bands, from which are cut out with a nipping tool the pieces which are required to be employed in different uses.

Whatever difficulty manufacturers may have had in procuring gutta percha fit to be made use of, they have at least been able to concentrate their efforts upon the discovery of uses to which it is adapted; and in the space of a few years have discovered numerous and important ones, as may be witnessed in the beautiful exhibition made by the Gutta Percha Company. One of the first and principal uses of gutta percha was to supersede the leather bands employed in machinery for the transmission of movements. This is very nearly the only use to which it has hitherto been applied in France. It seems, moreover, that latterly in England some inconveniences have been found to result from this employment of gutta percha; but should its use for that purpose diminish, every day others are found for it.

Indestructible by water, and at the same time a bad conductor of electricity, gutta percha has been found available for enclosing the metallic wires employed in the electric telegraph; and the use of this substance may certainly claim its share in the success of the submarine telegraph, which has just brought London and Paris within a few minutes of each other.

It may be conceived to what a variety of forms a substance can be turned which, becoming soft without adhering at the temperature of boiling water, regains at the ordinary temperature the slight elasticity and the consistence of leather. Thus agriculturists and manufacturers have turned it to account for the fabrication of buckets of all kinds, light, indestructible, and capable of being heated by a slight degree of heat and pressure when they are worn out.

It is especially in the manufacture of articles for maritime use that gutta percha, resisting as it does the action of water, and especially of salt water, appears to be the best adapted. Buoys of every description for anchors, nets, &c., have been made of it; sailors' hats, speaking-trumpets, &c. There is no doubt that it will be brought to perform a useful part in waterproof garments, as well as in the construction of life-boat apparatus. If India-rubber has been advantageously combined with leather, it may be conceived that the combination of gutta percha with wood, of which Mr. Forster has shown a specimen at the Exhibition, may in certain cases offer peculiar advantages.

The decorative art has also taken advantage of the plastic properties of gutta percha. All those different articles of furniture, the prices of which are so much enhanced by carving, are capable of being reproduced by means of pressure, and thus multiplied at a low price.

Writing-tables, work-baskets, &c., can be produced in gutta percha, and thus be made to combine the threefold advantage of lowness of price, elegance of form, and absence of fragility. In the large manufactory which is more especially devoted to the employment of gutta percha, are made every day a great quantity of mouldings, friezes, panels, leaves, &c., and of articles of every description. These, combined by the decorator, covered with gilding (which gutta percha takes in perfection), are, in the manufacture of picture-frames, and in the decoration of furniture, capable of superseding the carving upon wood, which is so costly, or papier-mâché and carton-pierre, which present the defect of great fragility. On going through the Exhibition of Messrs. Thom and Co., as well as that of the Gutta Percha Company, we may judge of the extent which the employment of this substance promises to the decorative art by the imitation of carving upon oak, rosewood, &c. Bronze articles have also been reproduced in a felicitous manner; and the clearness of the edges and the purity of the forms make it easy to understand how gutta percha has been found capable of being used for making galvano-plastic moulds, and how some experiments have begun to be tried for the purpose of substituting this material in the process of stereotyping, for the metal with which at the present day the pages of our illustrated books are multiplied. This employment of gutta percha for the reproduction, by pressure, of objects for interior decoration cannot but be widely extended, enabling the many to enjoy those graceful and elegant forms which, as long as they could not be reproduced in a material indestructible by water and free from fragility, could only be brought within the reach of the few.

Quite recently, by the exertions of Mr. Truman, a lump of coloured gutta percha, moulded into the form of a jaw-bone, has been found capable of holding together artificial teeth, and thus advantageously superseding those settings in gold, which were so costly, and the absolute rigidity of which, moreover, presented much inconvenience. The slight but sensible elasticity possessed by gutta percha renders it, on the contrary, very well adapted to this use.

There is another use to which the exertions of H. Mapple have rendered gutta percha applicable. Soles of this substance, glued on to the upper leathers by means of gutta percha dissolved in gas-tar, constitute shoes which are not affected by water, which will last a long time, are very simple and economical in their make, the soles of which are easily mended, and easily put on again when they come off, and can be made to serve anew by means of a fresh kneading up when they have become unfit for use; thus constituting a description of shoes, the use of which cannot fail to become extended in such a general manner as to render notable service to health. Gutta percha soles have also been found capable of being affixed with much advantage upon leather soles.

This solution of gutta percha in the oil of tar, like that of caoutchouc, which, by its evaporation, leaves the caoutchouc uninjured, can be made use of to obtain sheets of gutta percha of extreme thinness, which have already begun to be used in surgery, as well as in the preparation of waterproof papers and cloths.

It is more especially to the manufacture of chemical utensils for the preservation and conveyance of acids, that gutta percha seems destined to render the greatest services. Lately pumps for hydrochloric acid have been made of it, pipes for conveying this acid, bottles in which to send it away; large wooden vessels have been lined with gutta percha, in which to preserve the acid; gasometers are being constructed, which will be capable of collecting the sulphuric acid disengaged in certain chemical actions, and which would have corroded metallic vessels.

### § 2. Council Medal.

\*THE GUTTA PERCHA COMPANY, Wharf Road, City Road (85, pp. 783, 784). A great number of the novel applications of this substance have been invented by the Gutta Percha Company, and the great development which this Company has given to this branch of industry has

realized all that could be hoped from the employment of this substance. The exhibition also of specimens was very complete and extensive. The Jury, therefore, recommended that one of its great rewards should record their sense of exertions which have in a few years shown in so striking a manner the extent to which this new substance may be made available for the benefit of man, as well as the means by which it may be successfully employed. The Jury have, therefore, awarded a Council Medal to the Gutta Percha Company, as having, in the highest degree, contributed to these important results.

### § 3. Prize Medal.

THE WEST HAM GUTTA PERCHA COMPANY (90, p. 784). In the distribution of the awards of which gutta percha is the object, the West Ham Gutta Percha Company cannot be overlooked. They have also submitted to the judgment of the Jury the most varied objects manufactured in gutta percha, in which they have made use of certain processes peculiar to Mr. Charles Hancock.

A beautiful group, representing a boar hunt, covered with a metallic coating in imitation of bronze, displays in a very high degree the success with which gutta percha may be employed in the decorative and even fine arts. The exhibitor has succeeded in combining gutta percha with sulphur and the metallic sulphurets, to which the name "metallo-thianised" gutta percha has been employed. The gutta percha thus treated is as hard as ebony, and can be used for most purposes to which wood and ivory are generally applied.

### § 4. Honourable Mention.

J. MARTIN CABIROL, Paris (France, 786, p. 1218). The Jury think it right to record their sense of the merit of M. Cabirol's application of gutta percha to the manufacture of surgical instruments and apparatus, although the consideration of the merit of the particular object belongs to another Class.

### § 5. Other Contributors.

F. WHISHAW, 9 John Street, Adelphi, Designer and Inventor (Class X., 419, p. 454). Telekraphons, or speaking telegraph. Gutta percha telephone. Railway trains' communicator. Gutta percha tube and lathe-band, as first made at the Society of Arts in 1845. Subaqueous insulated electric telegraph conductors. Battery protector.

MARY O'DONNELL, 69 London Street, Reading, Designer (Class XIX., 53, p. 561). Ornamental leather. Hand-screens in stamped gutta percha, preserved real flowers and embroidery, &c.

THE GUTTA PERCHA COMPANY, Pat., 18 Wharf Road, City Road (Class XXVI., 21, p. 731). Table and pier glass in gutta percha ornament, in the natural colour.

F. THOMPSON, Westfield Terrace, Sheffield, Inventor and Manufacturer (Class XXII., 808, p. 670). Patent gutta percha skates of various colours and combinations.

THOMAS and Co., 98 New Bond Street, Designer and Manufacturer (Class XXVI., 1, p. 730). Gutta percha manufacture. Decorations; girandole; various specimens and patterns of frames, brackets, mouldings, &c.

T. WALKER, 1 Conduit Street, Regent Street, Inventor and Manufacturer (Class XXVIII., 87, p. 784). Gutta percha hat-bodies. Ventilated velvet hats, &c. Hat-case, answering for a life-buoy float, foot-bath, &c.

MISS MOORSON, Kensington (Class XXIX., 253, p. 802). Gutta percha models.

W. T. ILIFF, Newington (Class XXIX., 253A, p. 802). "London Street Scenes," "May Day," &c., modelled (by the hand) from gutta percha, by Miss E. Moorson, of Kensington, aged 13.

F. DINER, Vienna, Manufacturer (348, p. 1024). Gutta percha articles, including sticks, riding-whips, snuff-boxes, goblets, flower-pots, &c.

T. WHEELER, Toronto (353, p. 969). Medallion in gutta percha of the Earl of Elgin, Governor-General of Canada.

**SECTION C.—MANUFACTURE FROM IVORY, TORTOISESHELL, SHELLS, BONE, WHALEBONE, HORN, BRISTLES, &c., CORK, COCOA-NUT FIBRE, VEGETABLE IVORY, &c.**

The articles manufactured from the above substances, and not included in other sections, are not numerous, but are of a very miscellaneous character; it is therefore, almost impossible to give any connected account of them. Many of these materials were exhibited as raw products in Class IV., as ivory, whalebone, cork, &c., and to the Report on this section the reader is referred for their natural history. Such substances as ivory, bone, and horn, enter into the manufacture of many articles of use which have been referred to in the Reports on previous sections. The articles exhibited in this section will be referred to under each separate substance mentioned, and as near as possible under the heads before employed.

**I. ANIMAL SUBSTANCES INCLUDED IN SECTION C.**

**1. Ivory.**

This substance, obtained chiefly from the tusks of the elephant, of which a great variety were exhibited in Class IV., formed a conspicuous object in many parts of the Exhibition. Many of the articles formed of ivory which were exhibited displayed those qualities of taste and design which, although some were intended for use, removed them from the class which contemplated objects of utility, and placed them for examination under the Jury of the Fine Arts. Such were many of the specimens of ivory carving exhibited by the Hon. East India Company. The grotesque carvings of the Chinese, as well as busts and statues in ivory, were all thus placed beyond the jurisdiction of the Jury of Class XXVIII. The principal applications in ivory brought before this Class were delicate veneers, combs, and work inlaid with ivory.

**Prize Medals.**

THOMAS STAIGHT, 12 Walbrook, Manufacturer (Class IV., 109, p. 203\*). Specimens of turning and carving in ivory. Many of the objects exhibited were beautifully executed. A set of ivory chessmen, representing Crusaders, was especially deserving of notice. There were also specimens of carving in pearl deserving of commendation.

STAIGHT, D. and SONS (Class XXIX., 252, p. 802). Specimens of ivory veneering and other manufactures in ivory of a useful kind.

J. PRATT and Co., Meriden, Connecticut, United States, Inventor (567, p. 1469). This Company exhibited specimens of ivory veneer cut by machinery. These veneers were exceedingly delicate, one piece alone, 12 inches in width and 40 feet in length, having been sawn from a single tusk. The machine by which this veneer was produced was an invention of the exhibitors.

JOHN FENN, New York, United States, Manufacturer (111, p. 1440). An exhibition of several articles manufactured from ivory. The workmanship was very superior. The comb exhibited contained 150 teeth in the inch.

NOEL, sea., 33 Rue de Lancry, Manufacturer (France, 666, p. 1210). A large collection of well-manufactured ivory combs with hollow round teeth.

AUGUST HABENICHT (Vienna, 376, p. 1029). Amongst a number of articles for fitting up dressing-cases and for the toilet-table were some beautiful ivory combs.

LUDWIG GRIMMAR and Co., Weisbaden; Nassau (13, p. 1132). A cup in ivory, with figures in alto and basso relievo, the subject being Christ blessing the Children; also brooches and bracelets in ivory, carved with much taste.

LOUIS JOSEPH MASSUE, 3 Rue Aumaire, Paris, Manufacturer (615, p. 1207). A large assortment of well-manufactured ivory combs.

— WOLF, 2 Rue St. Appoline, Paris (744, p. 1216). Specimens of ivory carved in various forms.

HOLTZAPFFEL and Co., 64 Charing Cross, and 127 Long Acre, Manufacturers (Class VI., 232, p. 295). The Jury had their attention called to the beautiful specimens of ivory turning exhibited by this Company in the depart-

ment devoted to the exhibition of machinery, where they were exhibiting their turning apparatus. They were specimens of plain and ornamental turning, but some of a very superior kind.

H. WILLIAMS, Dublin, Inventor (163, p. 787). Eccentric ivory turning without eccentric chuck.

C. SHAW, Mount Street, Dublin, Producer (164, p. 787). Specimens of mechanical sculpture in ivory.

JOHN MAUNDER, Launceston, Cornwall (28, p. 780). A miniature dessert set turned in ivory.

In determining on the prizes in ivory work the Jury had some difficulty in ascertaining whether particular specimens belonged to their department, especially in the case of carving, in which case so many of the objects came under the Class of Fine Arts. Other exhibitors in ivory in Class XXVIII., to whom prizes were not awarded, were as follows:—

PETER JOHNSON, Wigan, Manufacturer (15, p. 779). A collection of fancy articles, many of which are turned in ivory.

E. CRUMMACK, York, Proprietor and Manufacturer (18, p. 779). A collection of ivory combs made by hand.

WALTER TRUEFIT, 1 New Bond Street (65, p. 782). Carved ivory brushes and combs.

OSCAR SMITH, 21 King Street, Covent Garden, Manufacturer (95, p. 784). Specimens of ivory turning and carving.

G. GARRETT, 1 Victoria Terrace, Woodbridge Road, Ipswich, Manufacturer (141, p. 786). Ornamental snuff-boxes turned in ivory.

W. D. HEMPHILL, Glonmel, Ireland, Designer and Manufacturer (108, p. 786). A variety of specimens of turned and carved ivory.

JOHN FRANCIS KAIN, 27 Brownlow Road, Dalton, Inventor and Manufacturer (45, p. 780). A full-sized bird cage made principally of ivory.

**2. British Ivory.**

This substance was exhibited by Mr. HENRY BROWN, of 187 Whitechapel Road (49, p. 780), and on account of its being likely to turn out an important and valuable discovery, and in many cases calculated to supersede real ivory, the Jury awarded a Prize Medal to the inventor.

**3. Tortoiseshell and Horn.**

Tortoiseshell, which is obtained from several species of the reptilian order *Testudinata*, but the best specimens more especially from the hawkbill turtle (*Testudo imbricata*), enters into the composition of many articles found in other classes of the Exhibition. It is employed in the manufacture of workboxes, clock-cases, tea-caddies, cabinets, card-cases, spectacle-frames, and other things. It is also employed in the manufacture of combs, and these articles of use were exhibited in Class XXVIII. For whatever purposes employed, the tortoiseshell is prepared in the same way. The part of the tortoise called the shell exists as a layer of cellular gelatinous matter on the surface of the external skeleton. This substance is separated from the osseous foundation on which it rests, by the application of heat. For this purpose the whole shell of the tortoise is exposed to the action of heat till the epidermal plates start from the bone beneath, and the final separation is effected by a long knife. The tortoiseshell, which is represented by the epidermis in other animals, is mainly composed of a substance resembling gelatine in its chemical character, and a small quantity of inorganic matter. On examination under the microscope it is found to consist of cells, which are naturally compressed, but may be made to assume a spherical form under the influence of a solution of potash and heat. On the application of heat the tortoiseshell becomes softened, and in this state may be compressed into any form required for manufacture. Sheets are thus prepared which, when cooled and cleansed, are submitted to machinery, by which they are cut into combs or other articles of use. No new or remarkable application of this substance came under the notice of the Jury. The collection of objects, however, exhibited by RICHARD PETERS and SON, of Birmingham

(131, p. 786), and referred to another class, afforded several instances of the uses of tortoiseshell.

Horn is employed for all the purposes of tortoiseshell, and its much greater cheapness gives it a more extended application. Knife-handles, buttons, umbrella-handles, whips, bell-pulls, drawer-knobs, sides of lanterns, besides all kinds of combs, are some of the purposes to which this useful substance is applied. In manufactures from horn that substance is chiefly obtained from the ox, although the tips, and even the whole horns of other animals, as of the ram, the antelope, the buffalo, the deer, are employed for special purposes. Among the imports into Liverpool in 1850 were the following:—

|                        | Tons. |
|------------------------|-------|
| Deer horns - - -       | 280   |
| Buffalo horns - - -    | 200   |
| Buffalo tips - - -     | 120   |
| Ox and cow horns - - - | 700   |

The latter were brought principally from South America, where they are obtained from the wild oxen of the Pampas. Horn, like tortoiseshell, is composed of a gelatinous matter with inorganic salts. Under the microscope it is seen to be composed of cells, which indicate its epidermal character, in common with the matter of which the nails, claws, hoofs, and hair of animals is composed. The horn which is used is developed around a vascular substance, which projects into the interior of the horn, and which is removed by steeping in water. In its preparation for manufacture, horn is exposed first to the action of boiling water, then of heat, under which it becomes softened, and may in proper moulds be made to assume almost any form. One of the best collections of articles in horn-work exhibited in the Crystal Palace was that sent by the SULTAN OF TURKEY, and the Jury accordingly awarded to his Highness a Prize Medal.

The following Prize Medals were also awarded for combs and articles of ornament manufactured in both tortoiseshell and horn.

E. CROMMACK, York, Proprietor and Manufacturer (18, p. 779). Tortoiseshell and horn dressing-combs.

FAUVELLE-DELABARRE, 10 Boulevard Bonne Nouvelle, Paris (France, 202, p. 1183). Tortoiseshell and buffalo-horn combs.

PHILIP, Passage Choiseul, Paris (France, 680, p. 1211). Bracelets, brooches, and ornaments in tortoiseshell.

POINSONGON, —, 23 Rue Neuve St. Martin, Paris (France, 1397, p. 1243). Imitation tortoiseshell combs.

J. and J. STEVENSON, Sheffield, and 9 Cripplegate Buildings, Wood Street, London (152, p. 786). Ornamental dress, and other combs, of ox and buffalo horns.

A. A. TRANCAT, 12 Rue Neuve St. Denis, Paris (France, 393). Tortoiseshell combs.

#### 4. Mother-of-Pearl.

An extensive assortment of mother-of-pearl ornaments, consisting of medallions, pen-holders, needle-cases, thimbles, &c., exhibited by J. SCHWABZ, of Vienna (684, p. 1642), and a collection of black and white pearl buttons by J. CHATWIN and SONS (Class XXII., 286, pp. 625, 626), of Birmingham, were the only articles brought under the notice of the Jury of this Class, and Prize Medals were awarded to each for the superior workmanship they exhibited.

#### 5. Shells.

But few examples of the use of shells for cameos were seen in the Exhibition. A Prize was awarded to a collection exhibited by N. JELLY, of Belgium (383, p. 1163).

Shells are frequently worked into the form of baskets, vases, &c., and are made to imitate flowers. This kind of work forms a considerable branch of industry in the West India Islands, in the Channel Islands, and in the Mauritius. Prizes were awarded for this kind of industry to the following:—

Messrs. BAKERFIELD and Co. (Mauritius, 5, p. 956).

The Messrs. GAMBO, Bahamas, p. 976.

Genr. The COMTESS of MAURITIUS, 1, p. 956.

Miss NICOLLS (Bahamas, p. 976).

In the collection of the Honorable East India Company were interesting specimens of bracelets and necklaces from Dacca. The construction of these ornamental objects employs a large number of persons. They are made from transverse slices of the *Turbinellus scottus*, and are often ornamented with metallic studs, or carved with various devices.

#### 6. Whalebone.

This substance is extensively employed in the arts, and was exhibited in its raw state in Class IV., and in various other Classes. Its manufacture for the purpose of covering whips, telescopes, and other instruments, and in thin strips for plait used in making bonnets and other articles of dress and use, came before the Jury of Class XXVIII., and the following Exhibitors were awarded Prize Medals:—

H. HORAN (Class IV., 103, pp. 201\*, 202\*).

WESTALL and Co. (Class IV., 104, p. 202\*).

#### 7. Bristles.

Brushes of all kinds made from bristles were rewarded in the collections by the following Exhibitors:—

#### Prize Medals.

H. M. ENGELER and SON (Prussia, 242, p. 1061). Painting brushes.

J. FINO (Sardinia, 77, p. 1305).

G. FOESE (Prussia, 813, p. 1095). Hall brushes instead of mats.

F. A. FRINNEDY (181, p. 787).

E. LAURENCO (France, 1296, p. 1238).

C. L. LONCKE-HAEZE (Belgium, 430, p. 1164).

K. G. PATTA (Austria, 350, p. 1024).

A. SMITH (55A, p. 784). Painting brushes.

H. SOMZÉ (Belgium, 265, p. 1159).

#### Honourable Mention.

A. DOW (29, p. 780).

L. F. FAUQUIER (France, 502, p. 1201).

J. G. HINDE (196, p. 788).

P. PAILLETTE (France, 1377, p. 1242).

#### 8. Hair.

Besides the uses to which the hair of animals is applied, and which are noticed by other Classes, the Jury have had brought before them a collection of bowls, dishes, plates, &c., formed of the hair of the rabbit, hare, and other animals, which are felted, and afterwards varnished. These utensils have the appearance of papier maché, or varnished leather, and possess the properties of being strong, durable, and very light. This manufacture is carried on principally in Russia, and a Prize Medal has been awarded to T. HANDOFFSKY (Russia, 265, p. 1375) for a collection of those articles.

#### 9. Porcupine Quills.

Allied in their production to bristles and hair are the quills of the porcupine. In the Canadian collection were several examples of articles of clothing and furniture ornamented with these quills, obtained from the North American porcupine. The quills are dyed, and the colours appear to be durable; and this use of them seems to be new and worthy of imitation in Europe. A chair and other articles, thus ornamented, were exhibited by Mr. W. DUNN, of Quebec (Canada, 119, p. 965), and by Mr. R. MARSHALL, to whom Prize Medals were awarded. Several articles of dress, ornamented in this manner, were exhibited.

#### 10. Quills of Birds.

Goose and other birds' quills are found in other Classes, but two applications of this material came before the Jury. In the first instance, E. R. RIGBY (58, p. 789) exhibited a collection of brushes made from split quills, which seemed to possess the qualities of cheapness and durability. The next instance was the application of the split quill to the making of children's caps and bonnets, and other articles

of dress, also baskets, by J. C. F. BADIN (France, 1063, p. 1229). Both these exhibitors were deemed worthy of a Prize Medal.

### 11. Silk-worm Gut.

This substance, used by the angler, and generally supposed to come from China, is manufactured in Spain, and the specimens exhibited from the province of Murcia, in the Spanish collection (189, p. 1342) were deemed worthy a Prize Medal. (Awarded a Prize Medal by the Jury of Class IV.)

## II. VEGETABLE SUBSTANCES INCLUDED IN SECTION C.

### 1. Cork.

Specimens of this substance in a raw condition, the produce of the cork oak (*Quercus suber*), were exhibited in Class IV. Many of the applications of cork found a place in this Class. The most interesting of these was that exhibited by Messrs. ESDAILES and MARGHAYE (125, p. 785), in which various uses were made of cork which had been veneered or cut into fibres. The following is the description of the specimens of this article exhibited, and which the Jury have deemed worthy a Prize Medal:—

Case No. 1.—1. Specimens of finished hats, made of cork, with the vendors' names, and the respective weights.  
2. Specimens of cork-hat bodies, or foundations, made solely of cork.

3. Specimen of a cork-hat body, or foundation, strengthened by muslin, as generally made and used by the trade.

4. Specimens of cork plates, cut by steam machinery, varying from 50 to 120 plates in the inch, in the state in which they are supplied to the hat-body makers.

5. Specimens of cork-tip pieces, of the like nature, in the state in which they are supplied to the hat-body makers.

6. Specimens of cork-hat cylinders, partly prepared and made up, in the state in which they are supplied to the hat manufacturers.

7. Specimens of cork-hat brim plates, in the state in which they are supplied to the hat-body makers.

8. Specimens of cork-hat brims, partly prepared and made up, as supplied to the hat manufacturers.

9. Specimens of printing on cork plates, with type and engraved blocks, exhibited by Mr. A. J. Mayer, inventor of the steam machinery employed at the City Saw Mills in this trade.

Case No. 2.—Fibre cut from cork by steam machinery, in its prepared condition, for the stuffing of ships' mattresses and boat cushions, to be used at sea for the preservation of life.

Case No. 3.—1. Specimen of a sea mattress, partially stuffed with cork fibre.

2. Specimen of the same, finished.

3. Specimen of a circular bolster, similarly stuffed.

4. Specimen of the application of cork fibre, applied as a packing to the stuffing-boxes of steam-engine piston-rods, and which is said to require no lubricating material.

Case No. 4.—Floating models, illustrative of the mode of using the cork fibre mattresses and bolsters as life-preservers at sea.

To the following exhibitors Prize Medals were awarded for general manufactures in cork, as well as the excellence of the manufacture of cork for the ordinary use of stopping bottles, casks, and other vessels:—

DUPRAT and Co (France, 492, p. 1201).

GERONA, THE PROVINCE OF (Spain, 189, p. 1341).

J. GUINART (Spain, 188, p. 1341).

### 2. Vegetable Ivory.

This substance is the albumen (perisperm) of the seed of a small species of palm growing in the valleys of the Andes, whence it is now imported in very considerable quantities into this country. Humboldt first drew attention to its hardness and whiteness, and the uses to which it is employed by the natives of the districts in which it grows. It is called the "niggers'-head tree," on account

of the form and size of the large black drupaceous fruit in which the seeds are contained. The fruit consists of several cells, in each of which is contained four seeds. The seeds are covered by a tough fibrous testa, which, on being removed, exposes the albumen, which represents the soft meat of the cocoa-nut and the seeds of other palms. At one end of the seed is a little cell, in which is enclosed the embryo, which seems to germinate without effecting any change in the condition of the hard mass by which it is surrounded. This is not the only palm whose seeds are hard enough for the uses of the turner, although the only one which is employed extensively for this purpose. The botanical name of the plant yielding these seeds is *Phytelephus macrocarpa*, and the order to which it belongs is that of *Palmæe*. It is a good substitute for ivory, where appearance and durability are not principal objects. Its whiteness soon becomes tarnished, and it wears when used for articles where much friction is required. The only articles made from this substance, exhibited in Class XXVIII., were those of Mr. BENJAMIN TAYLOR (47, p. 780), which consisted of a variety of objects turned with great skill, and for which a Prize Medal was awarded.

### 3. Cocoa-nut Fibres.

The seeds of the cocoa-nut palm (*Cocos nucifera*), so well known by the name of "cocoa-nuts," are contained in a large fruit or husk, which is composed of long solid woody fibres. The natives of Ceylon and India have long made use of these fibres for weaving various coarse fabrics; but although cocoa-nuts were brought to this country enclosed in this shell, it has not been till recently that they have been manufactured in Great Britain. They are now used for cordage, matting, brushes, and other purposes, to which the woody fibres of other plants, and even the bristles of animals, have been applied.

Prize Medals were awarded to the two following exhibitors:—

T. TRELOAR (89, p. 780). Samples of matting made of cocoa-nut fibre (patterns provisionally registered). The same, with an admixture of Manilla hemp. Door-mats of cocoa-nut fibre. Hearth-rug of the same. Mattress of patent curled cocoa-nut fibre. Brushes and brooms, various, all filled with the fibre. Specimens of cocoa-nut-fibre plait. Bonnet and hat made of the plait. Specimens of seating, or fine cloth of cocoa-nut fibre.

WILDEY and Co. (88, p. 780). Specimen of manufactures from the fibre of the outer husk of the cocoa-nut, consisting of floor-mattings, plain and coloured; door-mats; netting for sheep-folds and other uses; haub-sacks; nose-bags for horses. Cocoa-nut husk; fibre from the same; fibre prepared for brushes, substitute for bristles; fibre curled, substitute for horse-hair mattresses; fibre dyed; yarn spun from fibre; cordage, from fibre; curling and spinning machinery, and patent preparation of fibre from the husk.

The use of cocoa-nut fibre for bedding presents many advantages; it does not become knotty or hard, it does not harbour vermin, and it is not affected by variation of climate; it is also recommended by the great cheapness at which it can be produced.

### 4. Palm Leaves.

In their uses to the inhabitants of the tropics the family of palms represents almost all other families of plants. No part of these princes of the vegetable kingdom seems to be useless; and at every stage of their growth some new use appears to be developed. In the Mauritius collection, the Countess GRAY exhibited a basket and wreath of flowers formed out of the leaves of the double cocoa-nut palm (*Lodoicea Seychellarum*), which were considered worthy a Prize Medal.

In the Spanish collection were exhibited some most beautiful specimens of plait, made from the fibres of a species of palm; also some elegant cigar-cases from the Island of Luzon, and for which a Prize Medal was awarded to the Economical Society of Manilla. (Spain, 235, p. 1344.)

### D. GENERAL MANUFACTURES FROM WOOD, NOT BEING FURNITURE.

Under this head is included turnery in its various branches; carving, not having a special application, and not producing a work of art; all kinds of coopers' work, as well as basket and wicker work.

#### 1. Turnery.

Many of the articles exhibited in this Class illustrative of turnery have been already referred to under the head of the materials employed in this art, more especially under Ivory and Vegetable Ivory. The following exhibitors displayed objects presenting many points of interest in the art of turnery, though not regarded by the Jury as of sufficient importance to be rewarded with Prizes:—

B. MITFORD (187, p. 787). Concentric balls, made of solid spheres of box-wood. This curious art was first introduced by the Chinese.

— GARRETT (141, p. 786). Ornamental turned snuff-boxes in ivory and fancy foreign woods.

J. PERL (175, p. 787). Turning apparatus for cutting in relief in the lath. Fac-similes of medals, coins, flowers, &c.

OSCAR SMITH (95, p. 784). Specimen of ivory turning and carving, forming a pedestal, vase, and flowers. Unique specimen of ivory turning; a solid piece, the form of an egg, hollowed out to the thickness of the natural shell from a perforation of the twelfth part of an inch. Turned by George A. Smith, 22 May's Buildings, St. Martin's Lane.

W. D. HEMPHILL (158, p. 786). Plain and ornamental ivory turning.

#### 2. Carving and Working in Wood.

The more beautiful specimens of this art were referred to the Class of Fine Arts. The following collections, however, presenting many objects of interest, and good instances of the application of carving to utility and the improvement of the form of articles of ordinary use, were adjudged Prize Medals by the Jury:—

N. SCHNÜDER (Grand-Duchy of Hesse, 77, p. 1129). A collection of geometrical models. (Awarded a Prize Medal by Jury of Class X.)

N. P. THISEN (Sweden and Norway, 44, p. 1352). A collection of wooden vessels for various purposes, ornamented with carvings. These articles are made by the peasantry, and the present collection came from Christiansa.

CAPTAIN WUKA (China, p. 1220). A collection of objects brought by the exhibitor from China, and consisting of carvings in various kinds of hard coal and in pearl.

KERHLI BROTHERS, Meyringen (Switzerland, 242, p. 1282). A collection of articles of various kinds carved in wood.

The HEIRS of G. LANG (Bavaria, 77, p. 1104). Principally toys carved in wood.

J. WIRTZ (Switzerland, 259, p. 1283). Various articles of wood carving.

Spa, in Belgium, has long been celebrated for its work in wood; and a collection of boxes, exhibited by J. E. MARIN (Belgium, 414, p. 1164), was regarded as worthy a Prize Medal.

The Jury also wish Honourable Mention to be made of the beautiful collection of workboxes of the same kind exhibited by E. and L. MISSE (Belgium, 412, p. 1164).

#### 3. Coopers' Work of all kinds.

The collection of articles rewarded with Prize Medals in this department are regarded by the Jury as worthy of that distinction, both on account of the neatness and

durability of the workmanship, and the cheap price at which they are sold. The American and Canadian pails are a very superior article, and calculated for extensive use in Europe. The tubs and casks from Switzerland and Portugal indicated admirable workmanship:—

J. BAILEY (Canada, 86, p. 965). Water-pails.

J. A. FÄSSLER (Switzerland, 229, p. 1281). Milk-tubs, &c.

G. LORING (United States, 424, p. 1462). A large collection of water-pails.

J. W. MACGREGOR (146, Class XXVII., p. 786). Casks for ships.

A. P. RANGÉL (Portugal, 1120, p. 1317). Wine-casks.

#### 4. Basket and Wicker-work.

Several collections of articles in this division were exhibited, some deserving much credit, as those in the collection of the SCHOOL FOR THE INDIGENT BLIND; but the Jury did not observe any qualities in them that would call for more than the expression of their satisfaction at finding this branch of art represented in the Exhibition. A basket made of willow wood, worked in a peculiar manner, called the Sussex truck-basket, was exhibited by Mr. T. SMITH, of Hurstmonceaux (172, p. 787), to which the Jury awarded a Prize Medal.

### E. MANUFACTURES FROM STRAW, GRASS, AND OTHER MATERIALS.

The objects exhibited in this department were not numerous.

#### 1. Indian-Corn Straw.

This substance is manufactured into brooms in the South of Europe and in North America, and several collections of these articles were exhibited. The following were considered as deserving of Honourable Mention:—

NELSON and BUTTERS (Canada, 84, p. 965).

D. PASTORELLI (Tuscany, 35, p. 1294).

R. WARNER and Co. (United States, 431, p. 1463).

In the Canadian and American Departments several exhibitors contributed brooms of this material.

#### 2. Straw Work.

In various parts of the Exhibition collections of straw, plaited and made into flowers, baskets, &c., were exhibited. In some instances willow shavings were plaited and made into articles of dress. The following rewards comprise various collections in this department which the Jury considered worthy of reward or distinction:—

#### Prize Medals.

ART BROTHERS, Wohlen (Switzerland, 227, p. 1281). Straw work. (Awarded a Prize Medal by Jury of Class XX.)

AMBROISE CLARAZ, Fribourg (Switzerland, 228, p. 1281). Straw work.

C. D'HEUREUSE (Prussia, 244, p. 1061). Straw work.

F. P. HAAS (Wurtemberg, 79, p. 1119). Various forms of straw plaiting.

J. RENDALL (144, p. 786). Straw work.

SULEBERGER and AKERMANN (Switzerland, 234, p. 1281). Straw work. (Awarded a Prize Medal by Jury of Class XX.)

S. TANDLER (Austria, 657, p. 1041). Straw flowers.

L. TOMASSIA (Austria, 97, p. 1012). Willow plait.

#### Honourable Mention.

ISLER and OTTO, Wildegg (Switzerland, 213, p. 1280). Straw work.

London, February 1852.

EDWIN LANKESTER, REPORTER.

## . CLASS XXIX.

### REPORT ON MISCELLANEOUS MANUFACTURES AND SMALL WARES.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

#### Jury.

Viscount CANNING, *Chairman*, 10 Grosvenor Square.

— WOLOWSKI, *Deputy Chairman*, France; Professor to the Conservatory of Arts and Manufactures; Member of the Central Jury and of the Legislative Assembly of France.

WARREN DE LA RUE, Ph. D., F.R.S., F.R.A.S., F.C.S., &c., *Reporter*, 110 Bunhill Row, Finsbury, and 7 St. Mary's Road, Canonbury, Islington; Manufacturer of Ornamental Stationery.

A. W. HOFMANN, Ph. D., F.R.S., F.C.S., *Corresponding Member* of the Royal Academy of Turin; of the Philomathic Society of Paris, &c., *Joint Reporter*, Zollverein, 26 Albany Street, Regent's Park; Professor of Chemistry, Royal College of Chemistry.

ARTHUR HENFREY, F.L.S., 17 Manchester Street, Gray's Inn Road; Vice-President of the Botanical Society.

JOHN JOSEPH MECCHI, 4 Leadenhall Street; Maker of Dressing-cases and Cutlery.

OTTO SCHUMANN, Austria; Member of the Council of Commerce, Vienna.

W. K. SMITH, Virginia, United States; Mineralogist.

#### Associates.

D. W. MITCHELL, 11 Hanover Square; Secretary to the Zoological Society.

RICHARD OWEN, F.R.S. (Juror Class IV.); Professor to the College of Surgeons, Lincoln's Inn Fields; President of the College of Surgeons.

NATALIS ROWNOT, France (Juror Class XXVI.); late of the Embassy to China; Member of the Central Jury; Delegate of the Chambers of Commerce of Lyons and Paris.

*Members of other Juries, who by request attended some of the meetings of the Jury, and furnished information on the Chemical Arts.*

M. BALARD, France (Juror Class XXVIII.); Member of the Institute; Professor of Chemistry at the College of France, &c. &c.

A. PAYEN, France (Juror Class IV.); Member of the Institute; Member of the Central Jury; Professor to the Central School, and to the Conservatory of Arts and Manufactures, at Paris.

THE number of Exhibitors of all nations in this Class is seven hundred and forty-two.

According to the list furnished under the title of Head Juries, this Class was intended to comprise the following articles:—

A. Perfumery and Soap.

B. Articles for Personal Use, as Writing-desks, Dressing-cases, Work-boxes, when not exhibited in connexion with precious metals (XXIII.), and Travelling-gear generally.

C. Artificial Flowers.

D. Candles and other means of giving light.

E. Confectionary of all kinds.

F. Beads and Toys, when not of hardware; Fans, &c.

G. Umbrellas, Parasols, Walking-sticks, &c.

H. Fishing-tackle of all kinds, archery, &c.

I. Games of all kinds.

J. Other Miscellaneous manufactures.

The latter title is very comprehensive, and might have been made to include all objects not specially enumerated in the lists of other classes. Practically, however, little difficulty was experienced in arranging with the Juries of other Classes for their adjudication of those manufactures with which they were most conversant; consequently to the above list there will have to be added only Artificial Essences, Blacking, Lucifer Matches, Artificial Ivory, Taxidermy, Ethnographical Models, Educational Models, Pipes and Amber-manufactures, and Snuff-boxes. Candles were the only "means of giving light" brought before the notice of this Jury; and of beads those of amber only were taken into their consideration. The term "Miscellaneous" nevertheless was retained in order to enable the Jury to review a few objects not admitting of classification under the preceding heads.

The English Jurors held a preliminary meeting on the 13th of May, 1851, and on the 17th, the foreign Jurors having been appointed, the full Jury assembled and

elected their Deputy Chairman and Reporters. From this date until the 23rd of July inclusive, the Jury continued their meetings for the most part three times a week, and having, on the latter day, sent in their final List of Awards, they adjourned.

Owing to the very various character of the manufactures brought before the notice of the Jury, it was quite evident, as its members could not be equally conversant with all, that it would be expedient to divide the Jury into Sub-committees, of which four were formed, whose duty it was to make a preliminary examination of certain allied classes of manufacture, and to report thereon before the discussion of the awards took place. In those preliminary examinations the Committees availed themselves freely of their privilege of calling in the aid of persons more intimately acquainted than themselves with the technical merits of particular branches of art.

It was likewise the duty of the Committees to make a list of objects belonging to their various sections, a labour attended with no little difficulty on account of the necessarily imperfect state of the Catalogue at that time, and also from the classification which was adopted in the British Department, being impossible in the colonial and foreign sections. Even in the British section, Class XXIX. did not include all the articles ultimately submitted to the judgment of the Jury, and the Committees had often to search for them in other Classes.

The examination of the goods was usually commenced before eight o'clock in the morning, and continued for six or eight hours during each day, the earlier hours being occupied by the entire Jury in visiting the various stands and discussing the Awards; whilst soon after the admission of the public the Jury for convenience again divided into Committees. It is quite possible that with all the care bestowed on the search for objects belonging to Class XXIX., some articles may have escaped notice; yet the fact of the same exhibitor having been rewarded

by more than one Jury, elicited on comparison of the award books at the close of our labours, amply testifies the anxiety on the part of the Jurors generally not to pass any object of merit, even though they might feel doubtful as to its belonging to their respective classes.

In recommending subjects for the award of the Council Medal, the Jury of Class XXIX. adhered strictly to the spirit of the instructions of the Council of Chairmen, and of the explanation given in the "Minute of the Royal Commission on the award of the Council Medal," and in no case have they made any application for its grant, except for a *new and useful invention in important arts*.

The recommendations were three in number, namely, in favour of L. A. DE MILLY (France, No. 644, p. 1209), for the invention of practical methods of using lime in the manufacture of stearic candles, and the use of boracic acid in the preparation of their wicks; PRICE'S CANDLE COMPANY (Class IV., No. 83, p. 201\*), for the invention of improved methods of treating and distilling fatty bodies, and the application of the products obtained thereby to the manufacture of candles; J. MARQUES CONSTANTIN (France, No. 94, p. 1175), and (Portugal, No. 1294, p. 1318), for the invention of an elastic dressing to the materials used in the manufacture of artificial flowers, whereby they are not permanently injured if crumpled in packing, but regain their form on being slightly shaken; also for the adaptation of textile fabrics to the imitation of flowers for botanical museums. These recommendations were unanimously confirmed by the Group E of Juries; but the Council of Chairmen, whilst confirming the award of the Council Medal to L. A. De Milly and J. M. Constantin, negatived that in favour of Price's Candle Company. The Jury feeling that they had not made the recommendation until after a laborious investigation on the part of the Chemical Committee, Messrs. De La Rue, Hoffman, and Smith, and after ample discussion on their parts, protested on the 23rd of July against the decision of the Council of Chairmen in the following terms:—

"The Jury of Class XXIX. unanimously and respectfully protest against the decision which the Council of Chairmen have come to respecting the recommendation of a Great Medal for Price and Company, and feeling that their decision is based upon insufficient information regarding the merits of the case, they hope that the Council of Chairmen will not refuse to reconsider the matter."

In consequence of this protest, the Chemical Committee were invited to attend the meeting of the Council of Chairmen; two of their number, the Reporters, did so, and fully explained the grounds on which the recommendation had been made; but (as they were informed) it was subsequently found on reference to the minutes of a preceding meeting, that in consequence of a decision with regard to awards generally which had once been taken into consideration, the protest could not be entertained by the Council of Chairmen. The Reporters, however, cannot but regret that there should have existed any impediment to the correction of a decision which, from a careful scrutiny of the merits of the case, they consider erroneous.

The Prize Medal has been awarded for excellence of workmanship, novelty of construction, beauty of design, or goodness of manufacture, combined. At first sight, it may appear strange that the same reward has been given to a child's toy and to the botanical models in wax of flowers; to the important chemical art of stearic candle-making, and to the apparently insignificant sugar-confectionary. On reflection, however, it must become evident that the only method of making the Awards was to discard for the moment the consideration of all Arts except the one immediately under discussion, and to reward excellence in that one, irrespective of its value as compared with any other. The estimation of the amount of merit recognized by a Medal must, therefore, mainly depend on the nature and difficulties of the manufacture for which it is given, and marks only that an individual Exhibitor has attained a degree of perfection in no case inferior to that to be expected from the existing state of the art as evinced by the examples in the

Building, or known to have been produced elsewhere. In the same branch of industry questions of relative merit were only so far gone into as not to reward mediocre or bad productions; and consequently it will be seen that the Medal is in most cases a mark of *positive*, and not of *relative* merit, the Jury not having pretended to select the *best* only, but also the *very good*. This will be best illustrated by quoting an example, and for that purpose one of the most important arts is selected, namely, that of soap-making. In this no extraordinary superiority of any one manufacturer was evinced above all the rest, but a great number had attained a high degree of perfection, in which only differences of degree might be traced. It is evident that the Jury could not have selected any one, or even two or three, for reward without doing an injustice to many others; and it became necessary either to give no Medals at all, or to give one in all cases of decided merit. The Jury chose the latter alternative.

The distinction of Honourable Mention has been accorded in those cases where the merit of the Exhibitor was far above mediocrity, yet still below that of the recipients of the Prize Medal.

The detailed Report is arranged in an order slightly differing from that set forth at the commencement of this introduction, the following being the arrangement which was decided on:—

A. *Manufactures depending upon Chemical principles.*

Soap and Perfumery.

Candles.

Protean Stone, or Artificial Ivory.

Blacking.

Chemical Matches.

Confectionary, and Fruits preserved in Sugar.

B. *Manufactures relating to Natural History.*

Artificial Flowers.

Taxidermy.

C. *Articles connected with Education.*

Educational Models.

Ethnographical Models.

Collections of Produce.

D. *Manufactures for Personal use.*

Dressing-cases, Writing-desks, Work-boxes, &c.

Umbrellas and Parasols.

Walking-sticks.

Fans.

Pipes and Amber-manufactures.

Snuff-boxes.

E. *Manufactures relating to Amusements.*

Apparatus for Manly Games, viz., Cricket,

Archery, Rackets.

Fishing-tackle.

Toys.

F. *Miscellaneous.*

Including all articles not sufficiently numerous or important to be classified under distinct heads.

The plan followed has, in most cases, been to give a short historical sketch of the progress of an art, to discuss the scientific principles on which it is based, and to add such a description of the process employed as to enable the general reader to comprehend its chief details. The productions of each country, in alphabetical order, are then stated, and, lastly, the chief contributions of the successful exhibitors are specially noticed. The Report, however, is necessarily unequal in its details, some notices being much more complete than others. The Reporters are quite aware of these and other defects, and can only plead the very great difficulty of obtaining correct information on such a variety of subjects as the Report contains, and the very diversified nature of the goods exhibited.

The Reporters have great pleasure in thanking their colleagues, Viscount Canning and Mr. Arthur Henfrey, for Reports on special subjects; M. Natalis Rondot, for information respecting the arts in France and in China;

and Mr. J. J. Mechi, for the communication of statistics in some branches of trade; and, lastly, in acknowledging the assistance of their friends, Mr. Richard Thomson, Librarian of the London Institution, and Dr. Anthony, in supplying much historical matter. The Commissioners of Her Majesty's Customs, and John Wood, Esq., the Chairman of the Board of Inland Revenue, have also obligingly furnished the Reporters with statistical information respecting the Imports into, the Manufactures of, and the Exports from, the United Kingdom, for which they take this opportunity of publicly expressing their best thanks. They have also made free use of those valuable French and Belgian Reports, entitled respectively "*Rapport du Jury Central sur les Produits de l'Agriculture et de l'Industrie Exposés en 1849*," and "*Rapport du Jury et Documents de l'Exposition de l'Industrie Belge en 1847*."

## A. MANUFACTURES DEPENDING UPON CHEMICAL PRINCIPLES.

### I.—SOAP AND PERFUMERY.

The first of the two branches of industry now to be considered is probably of greater interest than any which will be discussed in the succeeding sections. The magnitude of the manufacture of soap, the importance of the trade, and the enormous capital embarked in it, as well as the wonderful relation which it bears with regard to the most important links in the chain of chemical industry, is not often sufficiently estimated. A distinguished chemist\* of the present day says—

"The quantity of soap consumed by a nation would be no inaccurate measure whereby to estimate its wealth and civilization. Political economists, indeed, will not give it this rank; but whether we regard it as joke or earnest, it is not the less true, that, of two countries with an equal amount of population, we may declare with positive certainty that the wealthiest and most highly civilized is that which consumes the greatest weight of soap. This consumption does not subserve sensual gratification, nor depend upon fashion but upon the feeling, of the beauty, comfort, and welfare attendant upon cleanliness; and a regard to this feeling, is coincident with wealth and civilization. The rich in the middle ages, who concealed a want of cleanliness in their clothes and persons under a profusion of costly scents and essences, were more luxurious than we are in eating and drinking, in apparel and horses; but how great is the difference between their days and our own, when a want of cleanliness is equivalent to insupportable misery and misfortune!"

It is interesting to cast a glance upon the early history of this important branch of trade. No mention of soap is to be found in the works of authors prior to the Christian era. The term soap occurs repeatedly in the Old Testament,† but the learned Beckmann‡ has proved, in his Treatise on Soap, that the Hebrew word "*Horith*," which has been rendered soap, rather means alkali. One of the most ancient descriptions of bathing and washing is to be found in Homer's§ narrative of the preparations made by the mother of the lovely Nausicaa for the washing, expedition to the river. Life-sustaining meats and refreshing wines, softening oil in golden vessels for anointing the skin, are carefully enumerated; but soap formed no part of the inventory. The Homeric virgins were ignorant of this invaluable oleo-alkaline compound. Pliny|| is the first writer who gives us an authentic account of soap. He states that it is made from tallow and ashes,

the best materials being goats' tallow and beech-ash. He was also acquainted with the hard and soft varieties of soap; he calls it a Gallic invention, but states that it was particularly well prepared in Germany, where the men were more in the habit of using it than the women. It served to colour the hair yellow. From the description of Pliny, it is evident that he really means soap, although the purpose for which it was employed creates some difficulty; and it would appear that the soap of the ancients contained some colouring agent, and served chiefly as a hair-dye, and likewise as a remedial agent. It does not seem that it was used for the purposes for which it is now almost exclusively employed. Besides several kinds of fullers' earth,\* and plants with saponaceous juices (*Sapindium*), the ancients availed themselves of solutions of soda and potash, which continue in use for washing in the present day. Strabo speaks of an alkaline water (soda) in Armenia which was used by the scourers for washing clothes, and we find express mention of the employment of a lye made with the ashes of plants (pot-ashes), in cleansing oil and wine jars, and the images of the gods in the temples.† The method of strengthening the lye by means of quick-lime was known, undoubtedly, in the time of Paulus Aegineta. The agent most commonly used for washing garments, however, was putrid urine, which is still employed in the cloth-districts for washing wool. The fullers were literally and metaphorically in bad odour, and were required to exercise their trade outside the town, or in unfrequented streets; but they were permitted to place tubs at the corners of the streets for the convenience of passengers and their own profit. Regarding urine in the light of soap, the Emperor Vespasian may be said to have originated the soap-duty, as this source of revenue was not lost sight of by him, though, as Beckmann remarks, it does not appear very clear how the tax was collected.

After Pliny, soap is mentioned by Geber, in the second century of the Christian era, and at a later period frequently by the Arab writers; but although undoubtedly used for washing, it is spoken of chiefly as a remedial agent for external application. It would be a difficult matter to trace the onward progress of soap-making, step by step, but it is certain that the boiling of soap flourished in the seventeenth century, as we possess extensive directions of that date for its preparation.

It is only in the most modern times that the soap-manufacture has attained that extraordinary development which distinguishes this branch of trade; various circumstances have contributed to produce it. The valuable researches of Chevreul, although they explain the nature of saponification, have contributed less to the advance of the soap-manufacture than to that of candle-making, hereafter to be described. On the other hand, the development of the manufacture of soda has proved a most powerful stimulus to that of soap, which when freed from its dependence on the uncertain and limited supply of barilla and kelp, made such strides as could not have been anticipated. Mr. James Muspratt, who was the first in England to carry out successfully, and on a large scale, Leblanc's method of preparing soda from chloride of sodium (sea-salt), informs us that he was compelled to give away soda by tons to the soap-boilers before he succeeded in convincing them of the extraordinary advantages to be derived from the adoption of this material. As soon, however, as he had effected this, and when the soap-boilers discovered how much time and money they saved by using artificial soda, orders came in so rapidly that Mr. Muspratt, to satisfy the demand, had his soda

§ *Odys.* vi.

|| Pliny, *Nat. Hist.*, xviii. (vol. ii., page 328 of Holland's translation), and in speaking of soap ointment, xxiii., c. 2, page 158.

\* Several varieties of fullers' earth are exhibited in the Grecian section Nos. 15 and 16, which, in all probability, are identical with those formerly used by the classical ancients; the reader is referred for the details to the *Illustr. Cat.*, vol. iii., pages 1402-3. There is also a specimen of fullers' earth contributed to the South African Department by J. Calf (No. 55). See vol. ii., p. 952.

† Egypt has sent some very interesting specimens of *Natron*, or native sesquicarbonate of soda: this salt is the *trona* of mineralogists. Tunis has also contributed a specimen. See Egypt, Nos. 11, 16, 17 (*Illustr. Cat.*, vol. iii., p. 1408), and Tunis, No. 149, (p. 1416.)

discharged red-hot into iron carts and thus conveyed to the soap-manufactories. From that period a constant race was kept up between soap-making and the artificial production of soda; every improvement in Leblanc's process was followed by an extension of the soap trade, and it is a curious fact that the single sea-port of Liverpool exports annually more soap at present than did all those of Great Britain previous to the conversion of chloride of sodium into carbonate of soda. The manufacture of soap has, on the other hand, been a powerful stimulus to the preparation of soda and of the important secondary product, hypochlorite of lime (bleaching powder), which are so intimately allied with almost all branches of chemical trades; thus soap occupies one of the most important pages in the history of applied chemistry. The increase in the consumption of this article has led, moreover, to the discovery of new materials for its production; it has opened new channels to commerce, and thus it has become the *medium* as well as the *mark* of civilization. Almost simultaneously with the employment of soda, the oils of the cocoa-nut and the palm have been introduced into the manufacture of soap. The following statistics respecting the imports into the United Kingdom and France best demonstrate the increasing consumption of these oils:—

|                             |      |   |   |         |
|-----------------------------|------|---|---|---------|
| Imports of Palm-oil in      | 1820 | - | - | Cwts.   |
| " "                         | 1830 | - | - | 17,456  |
| " "                         | 1840 | - | - | 213,476 |

The consumption of palm and cocoa-nut oils in France, although considerably less than in the United Kingdom, is rapidly increasing, as will be seen by the following table:—

#### Imports of palm and cocoa-nut oils into France—

|      |        |
|------|--------|
|      | Cwts.  |
| 1827 | 3      |
| 1829 | 70     |
| 1830 | 256    |
| 1835 | 253    |
| 1840 | 4,622  |
| 1845 | 33,691 |
| 1850 | 62,610 |

The development of the trade in palm-oil has contributed largely to the abolition of the iniquitous slave trade on the west coast of Africa, and in many parts of the coast has entirely suspended it.

#### Theory of the Formation of Soaps.

Before we proceed to the examination of the separate specimens of soaps exhibited, a few words may be said respecting the materials employed in their manufacture. They are, on the one hand, alkalies, and on the other, fatty and resinous substances derived from the organism of animals and plants, especially tallow, lard, palm-oil, cocoa-nut oil, olive-oil, linseed-oil, fish-oil, and common rosin. Although physically and chemically widely distinguished from one another, fats and oils present numerous analogies. None of these substances is a pure chemical compound; the majority are mixtures in varying proportions of different chemical bodies, which may be isolated by mechanical or chemical processes. When this separation has been effected, the isolated substances which are the proximate principles of the fatty or oily bodies, though again differing much from one another, exhibit one common chemical character; when exposed to the influence of powerful decomposing agents, they are broken up in a similar manner, yielding on the one hand an acid, and on the other a neutral body.

All fats may be resolved into two proximate fatty substances, one of which is fluid at the common temperature—it is termed *olein*; the other is solid, and is called *stearin*. The predominance of one or the other of these proximate constituents determines the state of aggregation of the fat. The body usually designated *stearine* is generally a mixture of the stearin of the chemist and an

analogous body, *margarin*, the two substances differing in their relative proportion according to the source from which the fat is obtained. Thus, the solid fat from sheep (tallow) contains chiefly *stearin*, that of the pig (lard) and of olive-oil, chiefly *margarin*; the solid fat of palm-oil is *palmitin*, that of cocoa-nut oil, *cocin*.

*Stearin*, *margarin*, *olein*, *palmitin*, and *cocin* are all compounds of certain fatty acids with oxide of glyceryl, and may be viewed as substances resembling neutral salts, or rather compound-ethers. The changes which all these substances undergo when submitted to the action of powerful bases is well illustrated by the deportment of *olein* with oxide of lead (litharge). When boiled with this base, the *olein* is decomposed into *oleic acid* and oxide of glyceryl. The former combines with the base forming an insoluble soap, called *oleate of oxide of lead* (diachylon plaster), and the oxide of glyceryl, separating in combination with water, forms *glycerin* (hydrated oxide of glyceryl), a substance having a certain analogy with the group of bodies termed alcohols. It remains dissolved in the water employed. If *olein* is boiled with a solution of potash or soda, *oleates of potash or soda* are obtained; but being soluble in water, they remain dissolved together with the *glycerin*.

The *oleates of potash or soda*, when separated from the water by processes immediately to be discussed, are what we call in common life *soaps*. Similar soaps are formed by the remainder of the fatty acids, for example, *stearic* and *margaric acids*. *Palmitate of soda*, obtained by boiling palm-oil with soda, likewise forms a chief ingredient of many soaps.

Potash and soda, as they occur in commerce, are combinations of the alkaline bases thus denominated by the chemist, with carbonic acid; and though, by long boiling, they could decompose (saponify) fats, yet the operation is tedious and the saponification generally incomplete. It is better to deprive the alkalies of their carbonic acid, which is done by mixing them with quick-lime and water; the quick-lime combines with the carbonic acid, forming an insoluble carbonate of lime (chalk), and the water retains the potash or soda in solution, contaminated still with such impurities as the alkalies contained (sulphates and chlorides, for example), and a minute quantity of Caustic lime.

Common rosin (colophony) is the residue of the distillation of natural turpentine, and consists principally of *pinic acid*, together with a little *sylic* and *colophonic acids*. When rosin is boiled with alkalies, carbonated or not, a compound is readily obtained, but of course no *glycerin*. Thus, when it is boiled with soda, a *pinate of soda* is chiefly produced. This compound exists in considerable quantity in yellow-soap, and gives to it its distinctive character.

The character of soap is not only affected by the nature of the acids which it contains, but also by that of the alkali which has served for its preparation; the soaps containing potash are generally soft and pasty, those prepared with soda are hard and solid.

The compounds of *stearic*, *margaric*, *oleic*, *palmitic*, *cocinic*, *pinic*, and *sylic* acids with potash or soda are all readily soluble in alcohol and hot water, but more so in the former, which, on evaporation, leaves the soap in a translucent state; hence its application in the preparation of "Transparent soaps." Soaps, however, are insoluble in a solution of many neutral salts, particularly when concentrated; this property is of great use to the soap-boiler, who employs it for the separation of the soap from its solution in water, generally adding common salt to set the soap at liberty. As soaps are likewise insoluble in strong alkaline lyes, the same end is sometimes attained by boiling down the soap to a certain consistence, when it separates from the excess of lye.

The soap made with cocoa-nut oil is, however, soluble in very strong brine, and the same plan of separation does not succeed with it; but as it is more generally employed together with other fats, this difficulty is then overcome. Its property of dissolving in salt water renders it peculiarly adapted to the formation of a *Marine soap*. One remarkable property of cocoa-nut oil soap is, that of solidifying with a much larger quantity of water than

most other soaps, thus giving a larger yield, but, of course, being of proportionally less value. This property is, however, unfortunately often turned to profitable account by the soap-maker. As an instance, may be quoted an analysis of Dr. Ure, who found a London cocoa-nut oil soap to contain 75 per cent. of water, whereas 25 per cent. of water is a large quantity for any but potash-soaps to contain, and these generally contain less than 50 per cent.

The greater part of our knowledge concerning the chemical constitution of fats, and the changes which accompany their decomposition under the influence of alkalis, is due to the masterly researches of Chevreul, prosecuted with wonderful acuteness and perseverance from 1813 to 1823, when they were published in Paris, in a collected form, under the title of "*Recherches Chimiques sur les Corps Gras d'Origine Animale*," a work which will ever remain a model of philosophical inquiry.

### Processes.

There are two processes chiefly employed in the preparation of soaps, the most simple of which is that called the *Cold-process* (from the combination being attained at temperatures below the boiling point of water), or the *Small-boiler-process* (as it is generally effected in comparatively small vessels). For the purpose of making soap in this manner, the alkaline lye is prepared from the purest commercial soda, and concentrated by evaporation. As the chloride of sodium and sulphate of soda, which commercial soda contains, are nearly insoluble in a strong alkaline solution, they crystallize out, especially on allowing the lye to stand for some days, thus leaving it much purer. A weighed quantity of fat is melted, and the strength of the lye having been previously ascertained by taking its specific gravity, a certain portion is weighed or measured, and separately heated and then stirred with the melted fat. Saponification soon occurs, and, on cooling, the soap solidifies. It is very evident that soap made in this manner, must contain the glycerin; moreover, as it is very difficult to obtain an exact neutralization of the fat or alkali, one of the other is often in excess, generally the fat; this prevents such soap from giving so good a lather as those prepared by the more usual method.

The ordinary method is called the *Large-boiler-process*, as it is usually conducted on a very large scale, in boilers capable of holding many tons. A quantity of weak soda-lye is put into the iron or copper boiler and raised to the boiling point, and the whole of the fat is generally added at one time. The ebullition is then carried on for some hours, and when the lye has become exhausted of its alkali, it is pumped away, and a fresh portion of lye is added. After repeated boilings and pumpings, the saponification is completed, and the soap is brought to strength by boiling down.

Now the soap-boiler may wish to prepare either white or mottled soap. If a white or curd-soap is required, the soap is "*fitted*," that is, boiled, with a certain quantity of water, or weak lye, and allowed to settle, when the black impurities ("*negre*") fall to the bottom, and the soap is then removed to the frames and allowed to cool. These frames are composed of a number of separate planks, to facilitate the removal of the soap.

The mottled-soap is prepared in a similar manner, except that the operation of fitting is dispensed with, and the "*negre*" is left in the soap. This negre consists chiefly of sulphide of iron, produced by the action of the lye, which always contains a minute quantity of sulphide of sodium, on the vessel. In Marseilles and other countries where olive-oil-soap is made, a quantity of sulphate of iron (green copperas) is added, and in this case the mottling is produced jointly by the sulphide of iron (the black portion) and a true iron soap (the red portion). In order that the metallic compound may not fall to the bottom (as in *fitting*), the soap has to be much more concentrated; when removed from the boiler it is of one uniform slate tint, but as it cools, the metallic compounds separate into nodules, and by the trickling of the excess of lye through the mass, they take up certain forms, which produce the appearance called mottling. Hence

mottled-soap is of more value, from its containing a less proportion of water.

It is evident, on comparing this with the cold-process, that it is much more scientific, as an excess of alkali may be employed to ensure complete saponification, with the perfect certainty that it can be got rid of in the lye; the glycerin is also removed with the impurities contained in the fat, at each pumping; and a very pure chemical compound is obtained, notwithstanding the employment of comparatively impure materials. If the soda-ash employed does not contain sufficient saline impurities to throw up the soap, it is necessary to add a solution of common salt to effect this object each time the exhausted lye is pumped off.

There have been several patents for changes in the process of the manufacture of soap, one of which (by Arthur Dunn) was for effecting the saponification in close vessels, at a very high temperature,  $154^{\circ} \cdot 6$  C. ( $310^{\circ}$  F.); this plan has not, however, been generally adopted.

Another patent was obtained for an exactly opposite plan, by Mr. Hawes, who making use of strong lyes and much mechanical mixing, effects the saponification of the fats in a comparatively cold state. The product is then put into a copper and "*fitted*" in the ordinary manner.

Several patents, taken out for supposed improvements, are in reality plans for the adulteration of soap; amongst which may be instanced the preparation of soap from bones, fish, &c., which is merely introducing an adulteration of gelatin. Other plans consist in the introduction of Cornish clay, fuller's earth, and other similar materials.

The Floating-soap, exhibited in many foreign Sections, is prepared by melting ordinary soap with the addition of a certain quantity of water, and then beating it into a thick froth by means of a paddle until it occupies twice its original bulk. Formerly this kind of soap was made in considerable quantities in England, but it is now very rarely manufactured, and was not exhibited at all in the British Department.

The soap called Silicated-soap, now manufactured extensively at Liverpool, is formed by mixing a basic-silicate of soda (made by boiling powdered flint in a close vessel under pressure with caustic soda) with hard-soap in the melted state. It appears to possess remarkable detergent properties, but is liable to feel gritty in the hand.

*Wax-Soap.*—This soap, which is made from wax and soda by the paper-hanging makers to mix with their distemper colours, in order to prevent their rubbing off, cannot be considered as a true soap in the ordinary acceptance of the term. For Brodie's elaborate researches "*On the Chemical Nature of Wax*,"\* clearly prove that on boiling wax with weak soda-lye, part only of the wax (the free cerotic acid) is saponified; the remainder, which is a neutral fat or ether (palmitate of oxide of mellissyl\*), is not acted upon, and is contained in admixture with the cerotate of soda in the state of emulsion. Probably the valuable properties of wax-soap are in some measure due to this circumstance.

### Properties and Action of Soap.

The detergent property of soap is usually considered to be dependent entirely on the quantity of alkali which it contains, and hence the question arises why pure alkali should not be employed in preference. An objection to this is the caustic character of the alkali, which is injurious not only to the hands of the person using it, but also destructive of the articles washed, and especially of some colours of dyed goods. By combining with fatty acids, the alkalis are rendered essentially milder in their action without being deprived of their capability of entering into combination with various impurities, and more particularly with certain fatty bodies. The most common explanation of the washing power of soap is founded upon Chevreul's observation that soaps are decomposed by large quantities of water, giving rise on the one hand to acid-soaps, and, on the other, liberating a quantity of free alkali which remains in solution. According to this view soap is a sort of magazine of alkali, which it gives up in the exact quantity required at any moment when it is rubbed with

\* *Philosophical Transactions*, Part I., 1849.

water. The combination of the alkali with some part of the dirt cannot be denied. Several constituents of this very indefinite admixture of many substances are of an essentially acid character, especially those derived from perspiration: others become acid when exposed on a large surface to the action of the air, in consequence of a sort of spontaneous saponification. This action cannot, however, be the sole *modus operandi* of soap, the valuable properties of which without doubt arise, in a great measure, from its power of dissolving substances which are insoluble in water. We know that certain mineral salts exert a solvent power upon substances which are entirely insoluble in water: thus it is well known that borax causes shell-lac to dissolve with great facility, and the chemist will at once call to mind the remarkable solvent property possessed by a soapy-compound ready formed in the animal organism; bile is essentially a combination of an alkali with fatty acids (glycocholic and taurocholic), and it dissolves with great facility the neutral body cholesterolin, which, like fat, is insoluble in water. In addition to these two modes of operation, soap doubtless also produces a mechanical effect. The property which it has of increasing the cohesion of water so as to enable it to form a lather or froth is most valuable in the removal of solid insoluble particles of dirt, which are carried away by the frictional action of the suds when forced into and out of the minute interstices of the substances subjected to the operation of washing, and are kept suspended by the froth and thus prevented from again soiling them.

If we adopt these views regarding the operation of soap, they guide us at once to a correct estimation of its washing capacity. It increases in a direct ratio with the quantity of true soap which it contains; the determination of the amount of water (by the simple device of drying the substance in the state of thin shavings at 100° C., 212° F.), consequently materially assists in the determination of the value of soap. But to arrive at an exact and rigorous knowledge of this value, a chemical analysis is necessary, and more especially when adulteration is suspected. We need scarcely remark, that the Jurors were unable to subject to analysis the varieties of soap of the numerous Exhibitors, many of whom had sent ten or more samples of different kinds. They, therefore, contented themselves generally with comparative trials of the detergent power of the various soaps, and for that purpose they had samples from all the Exhibitors. The toilet-soaps were judged of likewise by their perfume and presentability, and their freedom from gritty particles.

#### Perfumery.

From the earliest times of which we have any record, the sense of smell has been gratified with perfumes; the Egyptians applied them as conservative of the bodies of their deceased friends, and as incense before their venerated deities. On the wall of every temple in Egypt, from Meroe to Memphis, the censur is depicted smoking before the presiding deity of the place; on the walls of the tombs glows in bright colours the preparation of the spices and perfumes for the embalment of the mummy, and these very mummies and the vases of Oriental alabaster transported to our museums, tell with eloquence the same tale.

From the time of the Exodus throughout the long period of Jewish history, Holy Writ records the use of perfumes. Moses speaks of being directed by the Lord to prepare two perfumes, according to the art of the apothecary or perfumer, one of which was to be offered from the Golden Altar, and the other to be used on the person of the officiating priest. The "Spouse" in the Canticles is enraptured with the spikenard, the cinnamon, the aloë, and the myrrh; and Ezekiel accuses the Jews of diverting the use of perfumes from the Holy things to their own persons. In the New Testament, also, we contained frequent references to the use of perfumes, many of which will be in the memory of our readers. Especially, however, they will remember in chapter xiv. of the Gospel of St. Mark, that when Jesus sat at meat in the house of Simon the Leper,—"There came a woman having an alabaster box of ointment of spikenard, very precious, and she brake the box and poured it on his head."

Of the use of these luxuries by the Greeks, and afterwards by the Romans, the detail is more copious. Pliny gives much information respecting perfume-drugs, the method of collecting them, and the prices at which they sold. Oils and powder-perfumes, according to Seneca, were most lavishly used; for even three times a-day did some of the luxurious people whom he describes anoint and scent themselves, carrying their precious perfumes with them to the baths in costly and elegant boxes called "*Narthecia*."

The trade from the East in these perfume-drugs caused many a vessel to spread its sails to the Red Sea, and many a camel to plod over that track which gave to Greece and Syria their importance as markets, and vitality to the Rock-City of Petra. And Southern Italy was not long ere it occupied itself in ministering to the luxury of the wealthy by manufacturing unguents or perfumes. So numerous were the "*unguentarii*," that they are said to have filled the great street of ancient Capua, the Sepiasia. In short, whether to regale the nostrils of their deities while sacrificing, or their own while feasting, or to prevent those nostrils from being offended by defunct humanity or the exhalations from crowded masses of people, the consumption of perfumes by the ancients was enormous. Happily in modern times the free use of soap has superseded the necessity for their lavish employment.

When we consider that there are some persons who appreciate the strong smelling musk more highly than any other, and another who would "die of a rose in aromatic pain," the definition of a perfume becomes a matter of some difficulty. Notwithstanding, however, the various impressions that volatile substances make upon different constitutions, a few general principles may be determined by which perfumery may be judged. In the first place, it is necessary to distinguish whether the substance is a chemical compound, or whether it is a mechanical combination of various chemicals. In the former case, if carefully prepared, it is independent of the perfume, and its odour, whether agreeable or repulsive, has a determined character of its own. In the latter case, that is, if the scent depends upon a mixture of substances, an opportunity is offered to the manufacturer of exhibiting his skill. Perfumes, on evaporation, should yield no resinous residue, and the various essential oils of which they are made ought to be combined so harmoniously that none of the components is perceptible, not only at first, but even during the progress of evaporation. The less the ingredients differ from one another in odour and volatility the less difficult it becomes to achieve this desideratum. Hence well-prepared Eau-de-Cologne is generally considered to be the perfection of perfumery. The constituents of this scent are, so far as is known, the essential oils of the lemon, the citron, and orange, prepared from the fruit in different stages of maturity, and they approximate so closely to one another as to produce a single aromatic impression. Other oils are added to Eau-de-Cologne, but in so minute a proportion that they scarcely demand any notice in comparison with those mentioned. Eau-de-Cologne that leaves a residuary odour either of otto-of-roses, oil-of-cloves, or oil-of-cinnamon, after volatilization, however agreeable these oils may be to individuals, must be designated as of inferior quality.

Still much practice is necessary to ascertain differences in the quality of the perfumes, and the task is rendered more difficult if numerous specimens have to be compared; for this reason the Chemical Committee returned repeatedly to the examination of the various specimens before reporting to the Jury, by whom the Awards were only fixed after a farther investigation.

Several of the perfumes, or rather essences exhibited, are of particular interest, and deserve an especial notice. We allude to a series of artificial organic compounds possessing qualities which permit of their substitution for natural volatile oils and essences. Most of them are substances belonging to the group of compound-ethers. The fruity odour of these bodies has been long known; but they do not appear to have been used in flavouring until the chemist had shown that many of the oils of vegetable origin resemble in their composition the above-mentioned products of the laboratory. For some years

past a scent called Winter-green-oil has been extensively used in perfumery; it is obtained from an ericaceous plant, the *Gaultheria procumbens*, and is imported from New Jersey, in America, where it is obtained in considerable quantities. Chemical analysis of this oil has yielded the interesting result that it is a true compound-ether, consisting of salicylic acid and pyroxylic spirit, which may be formed by a combination of its proximate constituents, so as to possess all the characters of the natural substance. This observation was not lost upon commercial enterprise, and several of the numerous ethers prepared by the chemist were soon discovered to present the odour of certain fruits in so marked a degree, that it was difficult not to conclude that the fruits in question owed their smell to these ethers.

Several artificial essences of this kind are exhibited. Neither the time nor the quantity of material at the command of the Reporters permitted them to examine all these products; they are, therefore, obliged to confine themselves to a notice of the following:—

**Pear-Oil** is a spirituous solution of acetate of oxide of amyl. The latter may be obtained with facility and to any amount by distilling equal parts of concentrated sulphuric acid and fusel oil (the oily residue obtained by the rectification of potato or grain spirit) with two parts of acetate of potash. It is remarkable that the ether itself does not possess a very pleasant odour, and that its striking resemblance to that of pears does not become apparent until properly diluted with spirit. Artificial pear-oil is now prepared in large quantities in England. It is chiefly employed in the manufacture of the lozenges called pear-drops, of which the Exhibition presents some specimens, so that the flavour in its applied state may be tested side by side with the perfume.

**Apple-Oil** consists mainly of valerianate of oxide of amyl. It is obtained as a secondary product in the preparation of valerianic acid, by the distillation of fusel oil with bichromate of potash and sulphuric acid. The distillate has to be shaken up with a dilute potash-solution in order to remove the valerianic acid, when the ether floats on the top, and may be removed with a pipette.

**Pine-apple-Oil** is contributed by most of the Exhibitors of artificial essences; the specimen analysed was found to consist almost exclusively of butyrate of oxide of ethyl, or common butyric ether. It is easily obtained by boiling butyric acid (obtained from sugar by fermentation with putrid cheese) with strong spirit and a small quantity of concentrated sulphuric acid. It resembles the acetate of oxide of amyl in not presenting the characteristic agreeable fruity flavour, in a pure state; it requires to be considerably diluted before the odour appears. This oil is largely manufactured in England, and is employed in the preparation of a beverage called pine-apple-ale. The process commonly used for its preparation does not yield perfectly pure butyric ether. It consists in saponifying fresh butter with potash; the soap that forms is separated from the liquor, dissolved in strong alcohol, and distilled with concentrated sulphuric acid. This yields a mixture of butyric ether, and various other ethers; but the liquid obtained is perfectly adapted for the purposes of flavouring.

**Cognac-Oil and Grape-Oil.**—Specimens of these oils, especially of the former, are contributed by English, French, and German manufacturers. They seem to be often employed with the view of giving ordinary varieties of brandy the prized flavour of genuine cognac. Unfortunately the samples exhibited are too small to permit of a careful analysis. A few superficial examinations proved undoubtedly that they are compounds of fusel oil dissolved in a large quantity of alcohol; and it is curious that a substance which is most carefully eliminated from brandy on account of its offensive flavour, should be introduced in another form and in minute quantities in order to render the same beverage aromatic.

**Artificial Oil of Bitter-Almonds.**—As early as 1834, Professor Mitscherlich, of Berlin, pointed out a peculiar liquid formed by the action of fuming nitric acid upon benzole, and possessing the odour of natural oil of bitter-almonds in a high degree. It was called nitro-benzole or nitro-benzole. The preparation of this compound was, however, too expensive to admit of its substitution for

natural oil of bitter-almonds, as the sole sources of benzole, at that period, were the compression of oil gas and the distillation of benzole acid. In 1844, one of the Reporters\* succeeded in demonstrating the presence of this substance in common light coal-tar-oil; and in 1848, C. B. Mansfield† showed by a careful investigation that benzole may be easily obtained in large quantities from tar-oil. In the French Department, under the fanciful title of "*Esence de mirbane*," the Reporters met with several specimens of oils, which an examination proved to be nitro-benzole of more or less purity; they were, however, unable to obtain any positive information as to the extent of this manufacture; but it does not appear to be very considerable. The method employed in England for its preparation was devised by Mr. Mansfield, and is very simple; his apparatus consists of a large glass tube in the form of a coil, which at the upper end divides into two tubes, each of which is provided with a funnel. A stream of concentrated nitric acid flows slowly into one of the funnels, and benzole, which for this purpose need not be perfectly pure, into the other. The two substances meet at the point of union of the two tubes, and chemical combination ensues with the evolution of much heat; but as the newly-formed compound flows down through the coil, it becomes cool, and is collected at the lower extremity. It then merely requires to be washed with water, and, lastly, with a dilute solution of carbonate of soda, to render it fit for use. Nitro-benzole is closely allied to oil of bitter-almonds in its physical characters, yet it presents a slight difference of odour which may be easily detected by an experienced person. It is very useful for perfuming soap, and is probably capable of application in confectionary and cookery, as its flavour resembles that of bitter-almonds, without containing any hydrocyanic (prussic) acid.

#### UNITED STATES OF AMERICA.

The greater portion of the soaps exhibited in the American section are transparent, the preparation of which requires the employment of a large quantity of alcohol. This is sufficiently cheap in the United States to permit of its free use by the soap-maker in the production of toilet-soap. Transparent soap is there much esteemed, and forms an important article of commerce. There are Three Exhibitors of transparent, and One of other toilet-soaps, in the American Section, and also Four of soap for household or manufacturer's use.

The American spirituous perfumery, which was found to be inferior to that exhibited by other countries, is contributed by the makers of toilet-soaps. One Exhibitor sends only a tooth-wash or dentifrice.

#### AUSTRIA.

About 3,750 tons of olive-oil-soap, valued at 235,000*l.*, are manufactured annually in Austria, besides soap made with tallow, and other fats. The two large stearic candle-works of Vienna, "Milly," and "Apollo," produce annually about 2,000 tons of oleic-acid soap, as a secondary product. The chief manufactories of olive-oil-soap are situated in Venice and Trieste, from which latter place there is One contribution to the Exhibition; thus affording an opportunity of judging of the state in that locality of a manufacture which is mainly confined to southern Europe. It appears that lately the production of olive-oil-soap has much decreased in Austria, but this must be attributable to other causes than a deterioration in its quality, which was found most excellent. There are Two contributors of this and other soaps, both of whom have exhibited the floating or froth soaps.

The only Exhibitor of perfumery, JOHN MARIA FANINA (748, p. 1044), sent Eau-de-Cologne, which was so liberally distributed by means of a small fountain, that the supply in charge of the attendant was exhausted before the Jury had made the Awards, so that only the residue left in the fountain was submitted to them. As the specimen had evidently lost much of its perfume from exposure to the air, the Reporters, at the request of the Austrian Commissioner, M. C. Buschek, and with the

\* Dr. Hoffman.—W. D. L. R.

† Quarterly Journal of the Chemical Society, vol. 1., p. 244.

sanction of the Executive, examined, subsequently, a fresh sample, which was taken from a cask of Eau-de-Cologne which had remained under the care of the Customs, and which had been overlooked by the attendant. This sample was found to be equal in quality to the Eau-de-Cologne forwarded with Honourable Mention.

#### BELGIUM.

It is very remarkable that Belgium has sent to the Exhibition no green soft-soap (potash-soap), for which it has been famous from a very early period, and which, at one time, was an important article of exportation. Even now it is produced to a far greater extent than the hard soda-soap, the manufacture of which was commenced but a few years since, for the preparation of toilet-soaps. There is only one Exhibitor in the Belgian Section, and he sends toilet-soap only.

#### BRITISH COLONIES.

The British colonies have not yet progressed sufficiently in the art of soap-making to compete successfully with the world, as regards quality; at the same time it must be stated that their productions are, in most cases, creditable. The yellow-soap from Canada possesses a most disagreeable odour; the fancy soaps are likewise badly made, giving no lather whatever. The Cape of Good Hope sends a specimen of well-made yellow-soap from J. SMITH. India has contributed soap from Malabar, composed of cocoa-nut-oil and soda, and made up into irregular balls and long bars; this soap contains an excess of alkali, which effloresces at the surface, and is in general a very crude production. From Madras there is a specimen of well-made marine-soap manufactured by F. KEY (p. 323); and from Ceylon ornamented soap, called class-soap, manufactured at Kandy, from cocoa-nut-oil. New South Wales sends very creditable specimens manufactured at Bathurst, 140 miles from Sydney; the collection comprises yellow, curd, and toilet soaps. Nova Scotia contributes very good yellow-soap, manufactured by — CLARK, of Halifax (p. 370, Central Committee). New Zealand.—J. A. SMITH (No. 6, p. 1001), exhibits good soap made in Auckland. South Australia.—The specimens from this colony are all of yellow-soap, which was made by W. H. BURFORD (Class XXIX., Award Lists, p. 613), who is noticed in the List of Awards. Van Diemen's Land sends samples of good household soap, made by R. CLARKE, of Hobart Town (No. 144, p. 995). The West Coast of Africa sends specimens, which are interesting, as having been manufactured on the Oil Coast; they consist of soap made with a mixture of palm-oil and palm-kernel-oil, some made entirely with palm-kernel-oil, and soap made with ground-nut-oil. The oils used in their production are likewise exhibited.

#### EGYPT.

A few interesting and excellent specimens of perfumery have been sent from Egypt, comprising Rose-water of Fayoum, Orange-flower-water, and Mint-water of Rosetta.

#### FRANCE.

Although modern discoveries in chemical science, by furnishing a cheap substitute for barilla, have deprived Marseilles of some of its local advantages, this town is still the chief centre of the soap-manufacture in France, and from its position in the midst of the oil-producing countries, it is likely for a long period to retain the high reputation which for ages it has enjoyed for the olive-oil-soap to which it has given its name.

At one period Marseilles supplied the whole of France with soaps, in addition to large quantities exported to all parts of the world; but this privilege is becoming gradually curtailed by the establishment, round Paris, and other large towns, of soap-manufactories, in which tallow, palm-oil, and other fats, are employed in lieu of olive-oil; besides which nearly all the stock-andle-makers convert their olive acid into steaming and household soaps.

\* M. E. FALLET has proposed to use the oxide acid of the stearic matter for the scouring of wool, because it may be readily removed by the use of soda. This valuable plan does not appear to have met with the encouragement it deserves, more especially out of France.

The Parisian perfumers produce excellent toilet-soaps by the "large-boiler-process," remarkable for the fragrance of the perfume, and giving a good lather. In many cases toilet-soap is manufactured by the "cold-process," and is generally of an inferior quality, giving only a disagreeable sime when used in washing; there are, however, samples in the Exhibition free from this defect.

Many French people never use soap to their faces, employing as a substitute aromatic vinegar, a few drops of which are added to the water used in washing. Hence the "vinaigre-de-toilette," is an important manufacture, which is chiefly monopolized by Paris, whence it is sent to all parts of France. There are three Exhibitors of this aromatic vinegar.

Spirituous perfumery is prepared in great perfection by the manufacturers of Paris, some of whom distil their own essential oils; they generally, also, combine with it the manufacture of toilet-soaps, and hence, with a few exceptions, toilet-soaps and perfumery are exhibited together, and have been conjointly rewarded. In the preparation of essential oils the flowers are placed in a still, with water, and distilled. The vapour of the water carries over with it that of the essential oil, and both condense together, the essential oil swimming on the surface of the water, which, however, always retains a minute portion in solution. To recover this, the water is usually returned to the still and again passed over; M. PIVER, one of the French exhibitors, however, instead of so doing, employs the water for the perfuming of pomatum and hair-oil, which, from their attraction for essential oils, withdraw them from the water.

In 1847 there were, it appears,\* 110 perfumers in Paris, employing 721 workpeople in the manufacture of toilet-soaps, cosmetics, essential oils, and spirituuous and aqueous perfumery, the value of whose productions was 389,680*l*. The workmen earned, on the average, 2*s*. 7*d*. per day; the workwomen, 1*s*. 6*d*.

According to M. NATALIS RONDOT, 12,042,970 lbs. of soap, valued at 142,012*l*., were exported in 1850 from France, a quantity which, as will be hereafter seen, nearly equals that exported from Great Britain in the same year: besides which, 3,398,930 lbs. of perfumery, in value 431,638*l*., were also exported from France.

There are two Exhibitors of artificial essences in France. One sends simply a series of compound flavourings, intended to imitate the savour of various fruits; the second exhibits two specimens of chemical compounds, namely, artificial essence of bitter-almonds and artificial essence of pine-apple. The Jury did not, however, meet with any confectionary or perfumery in the French Section in which they had been employed.

Of the Nine Exhibitors of soap in the French Section, Two represent Marseilles, and Six, Paris; and, with two exceptions, these manufacturers exhibit toilet-soap only. There is likewise a small contribution of soap from Algiers.

#### GERMANY.

At one period all soap was manufactured in Germany by the *indirect*, or as it was called, the *German method*; but this is now fast giving way to the direct method, and will probably be ultimately superseded entirely by it. The indirect method, the result of empirical trials, and perfected only by long practice, is perhaps the most beautiful of all plans for making soap; the formation of this substance depending on a series of reactions, which modern chemistry explains, while at the same time, it fully confirms the correctness of the mode of procedure. Soap made on this plan is first prepared as a potash-soap by boiling the fats with a lye made with wood-ashes (a potash-lye), and is then decomposed while still in the boiler, by the so-called *salt-ing-process* (*Assaisien*), which consists in adding a strong solution of common salt (muriate of soda) to it, not merely to separate the soap from the water, but in sufficient quantity to yield the requisite amount of soda to take the position of the potash. The two bases, soda and potash, exchange places, the stronger base, potash, combining

\* *Statistique de l'Industrie à Paris*, par MM. SAY et NATALIS RONDOT. 2<sup>e</sup> partie, p. 466.

with the muriatic acid, and forming muriate of potash (chloride of potassium), the soda combining with the fatty acids, and forming a soda-soap. At one time this plan was of great value to a country like Germany, removed from the source of barilla, and producing little or none herself. Modern chemistry, by furnishing an abundant supply of cheap soda, however, renders this circuitous plan of much less value, and it must therefore give way to the onward march of science.

The Zollverein States of Germany are represented by Four Exhibitors of soap; Three manufacture household and soaping soap of excellent quality; the other, toilet-soaps. Hamburg is represented by One Exhibitor of floating and other toilet-soaps.

The performers of Germany are in great force, being Eight in number, and reckoning two John Maria Farinas in their ranks, making no less than four Farinas in the Exhibition, all claiming to be the original. It appears that speculation is carried to so high a pitch in Cologne, that any child, entitled to the surname of Farina, is bargained for as soon as born, and christened Jean Maria; at times this event is even anticipated. The perfumery of Germany is generally very good.

#### HOLLAND

is represented by One soap-maker, who exhibits olive-oil soap, and toilet-soap of fair quality.

#### PORTUGAL

sends the produce of the Royal Soap and Tobacco Contractor. The collection comprises olive-oil-soda-soap (Marseilles); rosin-and-tallow-soap (yellow-soap) and toilet-soaps, all of which are creditable.

#### RUSSIA.

There are only Two Exhibitors of soap in the Russian Section, one from St. Petersburg, the other from Warsaw. The latter sends very excellent toilet-soaps.

Russia possessed, in 1842, Sixty-four soap-manufactories, which produced soap valued at 205,800*l.*; and, in the government of Moscow, Three manufactories of perfumery, employing Fifteen workmen, which produced goods valued at 5,080*l.*

#### SPAIN.

The quantity of soap manufactured in Spain is very large, and exceeds that required for her home consumption, a considerable portion being annually exported to the Spanish colonies. The common hard-soaps are those principally produced, and they are made by the "cold-process." The following is a list of the towns and provinces in which the manufacture is chiefly carried on, the figures indicating the number of manufactories, wherever it was ascertainable:—Badajoz, 3; Caceres, 3; Cadix, 3; Burgos, 4; Gerona, 3; Guadalajara, 2; Guipuscoa, 3; Huelva, 2; Huesca, 1; Jaen, more than 10; Logrono, 1; Malaga, 7; Madrid, 1; Navarre, 7; Orense, 1; Port St. Maria, 1; Tarragona, 1; Toledo, 4; Valencia, 12; Soria, 1; Saragossa, 16; Xeres de la Frontera, 1. Madrid is represented by One Exhibitor of hard olive-oil-soap made by the "cold-process," which is sold at about a penny per pound less than that prepared in the ordinary manner. Malaga sends the produce of one of its manufactories, consisting of the ordinary mottled Castile-soap, made with barilla and olive-oil, in the large boiler, the colouring being obtained by sulphate of iron. This soap is very perfect, and is sold at the rate of 5*l.* 11*s.* 2*d.* per cwt., or almost exactly 1*s.* per pound. In 1842, Malaga produced 12,700,000 lbs. of soap; and in 1844, according to information collected on the spot by M. Nathalia Rondot, Cadix, Xeres, and Port St. Maria yielded 426,000 lbs.

#### SWITZERLAND.

The contributions from Switzerland consist merely of a small quantity of tooth-powder and hair-oil. It is stated that the tooth-powder is in general use, and is prepared from an indigenous stone, which is calcined and pulverized.

#### TUNIS.

The Tunisian soaps are composed of olive-oil and soda,

and are made in every part of the Regency, generally in copper vessels, holding from 40 to 50 cwt. each. The soda-lye is prepared by mixing the crude soda with the necessary quantity of lime, and putting the mixture into a reservoir, when water is added; under the reservoir is a well which catches the caustic lye as it flows from a hole in the bottom; from the well it is transferred to a copper vessel, and mixed with a proportionate quantity of oil, and boiled until it is made either into a hard-soap, or into one of a softer sort. The price of the hard-soap is from 30*s.* to 32*s.* per cwt., according to that of the olive-oil; the soft-soap is about 25*s.* per cwt. Soap is a very important article of commerce in Tunis, and is generally used by the lowest classes, whose habits of cleanliness are remarkable. There are five specimens of soaps made into bars; a toilet-soap, moulded by putting it into a small brass cup; and a jar of soft-soap; all of which are of a very primitive make.

The Tunisian collection of perfumery consists of scented waters, without any admixture of alcohol; they are prepared by distilling the flowers with water in a copper still. The ottos of Tunis, which are obtained by repeated distillations, are prized as being more fragrant, and are consequently more costly, than those made in Eastern countries, the usual price being from 2*l.* 1*s.* to 2*l.* per ounce,\* according to the description of flower from which they are obtained. Perfumery constitutes a most important branch of commerce in Tunis, a great quantity of scented waters being annually exported to France, Genoa, and Malta. There are also specimens of Swak, which is used by the Moorish women for whitening their teeth; and perfumed necklaces, noticed in the List of Awards.

#### TURKEY.

Turkey has sent a great variety of soaps, many of which are perfumed with musk, and ornamented with inscriptions; one kind, from Adrianople, is made up into hollow balls, containing a small bell, similar to those sometimes attached to the collars of horses; the Reporters could not, however, ascertain the purpose of the bell. The collection comprises soap from Adana, Adrianople, Candia, Jerusalem, Damascus, and Tripoli, besides a soft-soap called Alicant soap. None of these soaps afford a good lather.

The perfumery consists of:—orange-flower water and rose-water, both very fragrant; Tensauh or musk-paste; Kouderma or pastilles, for burning in the Seraglio; Tensauh, or musk-paste medallions, purses, and necklaces; and amber Tesbihs or chaplets, made of a paste composed of various perfumes. As the names of the Exhibitors of these various articles are not given, and as it appears that the specimens were bought at the bazaar, they are included in one general Award to the Sultan.

#### TUSCANY.

Tuscany sends the produce of One Exhibitor, comprising olive-oil-soap, tallow-soap, and yellow-soap; the two former may vie with any in the Exhibition, but the yellow-soap is not equal to that of English manufacture. In 1842, Tuscany possessed Sixty manufactories of soap and candles.

#### UNITED KINGDOM.

In no country in the world is the manufacture of soap carried on to so large an extent as in the United Kingdom, in which there are Three hundred and twenty-nine makers, besides Sixty-eight soap-remelters (perfumers). Ireland not being subject to a duty on soap, there are no ready means of ascertaining the quantity which is there manufactured; but in Great Britain alone the production amounted in the year 1850 to 204,410,826 lbs., and yielded an Excise-duty of 1,299,232*l.* 10*s.* 2*d.* Of this quantity 12,555,493 lbs. were exported to foreign parts, the drawback on it being 82,306*l.* 12*s.* 2*d.* The total quantity

\* In documents published from time to time by the French Minister of Commerce, it is stated that the common otto-of-rose is sold in the bazaar at 5 piastres the mital; reckoning the mital at 4.75 grammes, or 78.774 Troy grains, the avoirdupois ounce of 437.5 grains would cost 1*s.*

consumed in Great Britain, therefore, amounted to 161,858,393 lbs. Of this quantity 22,858,393 lbs. were used by manufacturers, on which the duty, amounting to 27,843. 0s. 11d., was remitted. This leaves the net revenue derived from the soap-duty at 1,119,581l. 10s. 8d., after deducting the drawback and the remission to manufacturers. Deducting the quantity exported, and that used by manufacturers, it appears that 168,996,951 lbs., or, in round numbers, 75,445 tons, were consumed in 1850 for domestic use in Great Britain (making 8 lbs. 1 oz. each person); besides that manufactured and consumed in Ireland, of which there are no returns. The Excise-duty was first imposed in Great Britain in 1711, the rate being 1d. per pound. In 1713 it was raised to 1½d. per pound, and in 1782 the duty on hard-soap was fixed at 2½d., and that on soft-soap at 1½d. per pound. In 1816 the duty on hard-soap was raised to 3d. per pound, at which rate it was levied until May 31, 1833, when the duty was reduced to 1½d. per pound on hard-soap and 1d. per pound on soft-soap. The present duty is according to these rates, with an addition of 5 per cent. The collection of this duty (notwithstanding the great improvement in the Excise regulations of late years) places the British manufacturer under certain restrictions as to his operations, which prevent him from conveniently making toilet-soap. In order to obtain toilet-soap the ordinary soap has to undergo a second process of clarification, and, after having been performed, has to be made up in some presentable form; it is this which has given rise to the business of the soap-remelter, who buys his soap of the maker, remelts, perfumes, and then makes it into tablets. Two Exhibitors, however, of toilet-soap carry on all the operations in their works. In Ireland the perfumer generally makes his own soap by the "cold-process," and One Exhibitor sends toilet-soap made in this way.

Several descriptions of fat are used by the British soap-maker, the principal one being tallow (prepared from the inside and outside fat of oxen and sheep), which is imported in large quantities from Russia, South America, and Australia, the produce of the two last-named countries being more generally employed. Palm-oil, rosin, and cocoe-nut-oil are likewise used, to which must be added bone-fat and "kitchen-stuff." Kitchen or "rough stuff" is collected from private families, where it is usually the perquisite of the cook, who frequently adds a few candles and occasionally a potato, in order to increase the weight. The kitchen-stuff is bought up by the stuff-collectors from the rag and oil shops, and then sold to the soap-maker, who melts it down previous to use.

Before the repeal of the duty on salt, large quantities of barilla (then the only source of carbonate of soda) were imported into this country from Sicily, Teneriffe, and Carthage for the use of the soap-maker; its repeal was most beneficial from the stimulus it gave to the manufacture of soda from sea-salt, destined soon to supply exclusively the wants of the soap-boiler, who after a short time discarded the impure barilla, which not only was much more costly, but had to be ground to powder in a horse or steam-mill, before the lyes could be prepared, the operation usually occupying two days; whereas the soda-ash (prepared in enormous quantities in Liverpool, Glasgow, and Newcastle), besides containing twice as much soda as the barilla, comes to him in a powdered state ready for immediate use, and enables him to prepare the lyes in a few hours.

Within the last three years the soap manufacturer has been supplied with fine American rosin (colophony), very much purer and of a much paler colour than that of English make; from this cause yellow-soap has been much improved, and is now made of a beautiful, pale yellow colour (primrose soap).

Yellow-soap, first manufactured in England, is that produced in the largest quantity, and is composed of tallow, rosin, and soda. Mottled-soap is next in importance, and is usually made from kitchen-stuff and soda. Curd-soap, which is used to a great extent by the cloth-manufacturers of Yorkshire, and the lace and stocking bleachers of Nottingham, is made of tallow and soda (100 lbs. of tallow yielding from 150 lbs. to 155 lbs. of perfect curd-soap). Besides these, there are various other kinds, as, for

example, palm-oil-soap, which is usually prepared as a component of yellow-soap; cocoe-nut-oil-soap; and other kinds prepared chiefly for exportation, in which a low price, unfortunately, is a more important consideration than a high quality.

Soft-soap is made with potash (instead of soda) and various kinds of oils; Greenland, Southern, and other fish-oils being generally employed, when the soap is intended for the cloth-districts. There is usually a small quantity of tallow mixed with the oil, so as to produce the fig-like appearance common in soft-soap; this is due to the stearate of potash formed in consequence of this addition, and which is less deliquescent than oleate of potash. Sometimes lime is added to imitate the white particles, but it is easily detected on dissolving the soap in water.

At present very little soap is made in this country from olive-oil, partly because, since the alteration in the duty on foreign soap, its manufacture does not repay the soap-maker, and partly on account of the "London New Pharmacopoeia" directing soft-soap to be used in lieu of "Castile-soap," as it is found to be better adapted for the retention of a proper degree of moisture in pharmaceutical preparations.

Out of the 329 soap-makers of the United Kingdom, only seven come forward to represent the soap-trade. On comparing the productions of other nations with theirs, it is evident that as regards tallow, palm-oil, and rosin-soaps, the British soaps are generally better manufactured, notwithstanding the Excise restrictions under which the English manufacturer labours.

The English toilet-soaps are in no respect inferior to those of other countries, and are generally far superior in their detergent qualities, on account of their being made from soap manufactured exclusively by the "large-boiler-process." The high reputation of the so-called Windsor-soap in all civilized States is an ample testimony of the estimation in which English toilet-soap is held by the makers of other countries, who adopt its name for any sort they wish particularly to recommend. The preparation of toilet-soaps is generally confined to the remelter, who perfumes and ornaments them in various ways. The marbling is effected by rubbing up the colours, such as vermilion or ultramarine, with a little olive-oil or soap, and taking a small portion on a palette-knife, which is pushed through the melted mass, and moved about according to the fancy of the operator. Many soaps are coloured throughout their mass with mineral colours. Vermilion is used to produce the pink colour of rose-soap, artificial ultramarine to produce blue, and various ochres to produce browns. Tablets are made by placing a soft mass of soap into a mould, fixed in a lever-press, and composed of a top and bottom die, which fit into a loose ring; by a rapid pressure the shapeless mass takes the form of the ring, and is at the same time embossed on the top and bottom of the cake. The ornamenting by means of coloured cameos is effected in a similar manner, but requires two presses, one of which forms the cake, and makes depressions for the reception of a different coloured soap, which is filled in by hand, and the cake is then placed in the second press, which embosses the coloured portion.

No less than Twelve out of the Sixty-eight soap-remelters of Great Britain exhibit. Most of them send also perfumery; and Eight manufacturers, besides the Twelve above-named, exhibit perfumery only. The English perfumery was found in many cases to be very fragrant and agreeable, but in others the employment of an excess of some strong-smelling essential oil rendered the compound anything but a desirable article for the toilet. The imports of perfumery into the United Kingdom in the year 1850 were valued at 1,907l., and a duty was paid of 191l., but in all probability some spirituous perfumes are included under the head of "Oils, chemical, essential, and perfumed," of which 172,139 lbs. were imported, and which yielded a duty of 12,773l.

Two Exhibitors have contributed specimens to which allusion has been made in the preceding pages, and to which a great degree of interest attaches, as being among the first attempts at the application of anhydrous chemical

compounds for the imitation of the flavours of fruits and liquors, namely, Oil of Pears, Oil of Apples, Oil of Pine-apples, Oil of Cognac, Oil of Grapes, and Onion-Sauce.

There are Ninety-five Exhibitors of soap and perfumery; of this number Sixty-two are solely or chiefly manufacturers of soap, and Thirty-three solely or chiefly makers of perfumery, though many of the perfumers send both soap and perfumery. Of those who exhibit soap, Seven (English) are merely remelters and perfumers of the goods they purchase of the soap-boilers; Five are makers of a floating or foam-soap; and Four exhibit soap made by the "cold-process."

Among the perfumers there are Two who exhibit savory sauces, and Five the artificial essences before described.

Of the Ninety-five Exhibitors there are—

|    |                                  |
|----|----------------------------------|
| 31 | Holders of a Prize Medal.        |
| 18 | Who obtained Honourable Mention. |
| 46 | Unrewarded.                      |
| 95 |                                  |

The number of Exhibitors from the various countries is as follows:—

|                                       |    |
|---------------------------------------|----|
| America, United States                | 9  |
| Austria                               | 4  |
| Belgium                               | 1  |
| British Colonies:—                    |    |
| Canada                                | 2  |
| Ceylon                                | 1  |
| Cape of Good Hope                     | 1  |
| India                                 | 2  |
| New South Wales                       | 1  |
| Nova Scotia                           | 1  |
| New Zealand                           | 1  |
| South Australia                       | 1  |
| Van Diemen's Land                     | 1  |
| West Coast of Africa                  | 2  |
| Egypt                                 | 1  |
| France and Algiers                    | 14 |
| Germany, Zollverein and North Germany | 13 |
| Holland                               | 1  |
| Portugal                              | 1  |
| Russia                                | 2  |
| Spain                                 | 2  |
| Switzerland                           | 1  |
| Tunis                                 | 2  |
| Turkey                                | 3  |
| Tuscany                               | 1  |
| United Kingdom                        | 27 |
|                                       | 95 |

Besides this number, Eight stearic-candle makers have also sent soap made with the oleic acid, derived as a secondary product from their manufacture; these eight raise the number to One hundred and three, but no special notice will be given of their productions in this portion of the Report.

#### LIST OF AWARDS.

**ALLARD and CLAVE**, Paris (France, No. 750, p. 1316). Prize Medal. A collection of fancy Toilet-soaps, in large blocks, marbled and otherwise ornamented; soap in cakes and balls; Petach-shaving-soap. These soaps are made in the ordinary manner, in the large boiler, and afterwards perfumed; they are most agreeable in use, giving very readily an abundant lather, and are free from an excess of alkali. Their perfumery is of various kinds, and very good.

**ANNAYON, H.**, Marseilles (France, No. 402, p. 1197). Prize Medal. A very large collection of Marseilles mottled (Castile-soap), Yellow palm-oil, and Bleached palm-oil-soaps. The yellow soaps are not so slightly as those manufactured in England, but are good. The mottled Marseilles soap is, however, excellent.

**BASTIN, E. A. FINE**, Philadelphia (United States, No. 38, p. 1434). Prize Medal. A very large collection of fancy soaps; Transparent-soaps, made up into cakes and balls; Transparent-shaving-soaps; Hazel-oil-soap; bars of American savants. The soaps are well manufactured, fragrant and agreeable.

Besides the above, various spirituous perfumes are exhibited, which are not included in the award.

**BLAUSON, H.**, Paris (France, No. 1091, p. 1230). Honourable Mention. Soaps and perfumery. The soaps are manufactured by the "cold-process," and they give a tolerable lather.

**BURROUD, W. H.** (South Australia, p. 1061). Honourable Mention for well-made Yellow-soap.

**BUSCH, P. A.** (Frankfort, 5 Zollv., No. 2, p. 1141). Honourable Mention for Rectified Cognac-oil.

**CADWELL, PAYSON, and Co.** (United States, No. 510, p. 1467). Prize Medal. A soap called Excelsior-soap, not very slightly, but possessed of remarkable detergent properties, especially in very strong brine. In the trial made with this soap, it was found to possess the valuable property of readily removing tar even in salt water, which renders it peculiarly well adapted for a Marine-soap. A comparative trial was made at the same time with scouring-soaps, selected from the best in the Exhibition; they all answered as well as the Excelsior-soap, except in the removal of tar when washing with a solution of salt.

Much stress was laid on the low price (30s. per cwt.) at which this soap may be produced; but as on examination it was found to contain earthy matters, with which any soap may be much reduced in cost, the lowness of the price did not influence the Jury in their Award.

**CHIOZZA, C. L., and SON**, Trieste (Austria, No. 43, p. 1009). Prize Medal. Soaps of excellent quality, and in great variety. Superfine Marseilles; Blue-marbled; Floating white Genoa; Hard imitation English soap; Cocoa-nut-oil-soap; common Floating rose-coloured soap; white Card soap, for toilet purposes, also Blue and Red-marbled; Cocoa-nut-oil toilet-soap; besides various scented soaps; all of which afford an excellent lather, and are, in every respect, carefully manufactured, and free from an excess of alkali.

**CLEAVER, F. S.**, 18, Red Lion Square (Class XXIX., 20, p. 790). Prize Medal. Mr. Cleaver is a soap perfumer and remelter; his large and varied collection comprises the following descriptions:—Honey-toilet-soap; this soap contains no honey; it is perfumed with the essence of citronelle, and is a very agreeable toilet-soap. May-blossom-soap is a honey-soap containing cream of tartar. Peach-blossom-soap is a composition flavoured with oil of bitter almonds, and made up into balls, which derives a peculiar peach-like partial stain from the addition solely of cream of tartar. Soaps marked by Dunn's process of lettering, which consists in stamping recesses of the shape of the letters, and filling them with soap of a different colour.

All the soaps are of most excellent quality, very fragrant, and afford a copious lather.

**COLLAS, M. A.**, Paris (France, No. 801, p. 1219). Honourable Mention. (*The same Award by the Jury of Class II.*) Artificial essence of Bitter-almonds; artificial essence of Pine-apple. (See pages 1347 and 1348.)

**CONTI and SON**, Leghorn (Tuscany, No. 23, p. 1293). Prize Medal. Olive-oil-soap (white Marseilles); Olive-oil-mottled-soap (Castile-soap); Tallow-curd-soap—most excellent in quality.

**COWAN and SONS**, 139 New Gravel Lane, Shadwell. (Class XXIX., No. 19, p. 790). Prize Medal. Pale-yellow-soap of very excellent quality; Curd-soap, most carefully prepared; Marine-soap, for washing in salt water. This collection, though comprising few varieties, is valuable from its showing the degree of excellence attainable in the art of soap-making.

**DE LEON Y RICO, E.**, Madrid (Spain, No. 243, p. 1344). Honourable Mention. A very hard Olive-oil-soap, made in twenty-four hours by the "cold-process." It affords a lather with some difficulty at first, but by the second day's use acquires a little moisture and then gives one more readily. This plan of making does not yield a soap equal to that of the "large-boiler-process," but the specimen is very good of its kind, and free from excess of alkali.

**DOUGLAS, J. S., and SONS** (Hamburg, No. 32, p. 1129). Prize Medal for toilet-soaps, made from cocoa-nut-oil and soda, (probably by the "cold-process"); Marbled-soap, made from tallow; likewise the Floating or froth-soap;

of which are of good quality. This latter, in the trade of perfumery, is alleged to be made according to a recipe which a friend transmitted from China, and which he obtained by bribery, on penetrating into the Imperial Soap-Manufactory of Canton.

**EDM and Co.**, 47 Ludgate Hill (Class XXIX., No. 18, p. 790). Honourable Mention. For a case containing Perfumery of various kinds. The imitation of the scent of flowers was found in many cases to be successful.

**FARINA, JOHN MARIA**, 28 Rhein Strasse, Cologne, and 1 Salters' Hall, Cannon Street, London (Class XXIX., No. 21, p. 790). Honourable Mention. For a long period after the opening of the Exhibition, M. Farina distributed his fragrant Eau-de-Cologne, with great liberality, by means of a fountain.

The specimens exhibited in bottles were of excellent quality, evaporating perfectly without resinous residue.

**FARINA, JOHN MARIA**, Cologne (Prussia, No. 426, p. 1074). Honourable Mention. Very fragrant and agreeable Eau-de-Cologne, evaporating perfectly without resinous residue.

**FARINA, JOHN MARIA**, opposite the Jubilee Place, Cologne (Prussia, No. 558, p. 1086). Prize Medal. Eau-de-Cologne of most excellent quality, possessing in a high degree that fragrance and freedom from unpleasant residuary odour, for which this article of toilet is esteemed.

**FARINA, JOHN MARIA**, opposite the New Market, Cologne, and 53 Mark Lane, London (Austria, No. 748, p. 1044). Eau-de-Cologne. Honourable Mention.—See Introductory matter, Austria, p. 609.

**FARRER, T. W., and Co.**, King's Head Court, Barbican (Class XXIX., No. 22, p. 790). Honourable Mention. Three cases of perfumes, and a sauce known as Harvey's sauce. The Jury accord an Honourable Mention of the perfumery, which is fragrant and leaves no residuary unpleasant odour after evaporation.

**GALLÉ and Co.**, Paris (France, No. 845, p. 1220). Prize Medal. For a very large collection of fancy Toilet-soaps, made by the small boiler, or cold-process, and free from the defect of not giving a lather, which is usually the case with soaps made in this way. And also, for an assortment of very agreeable perfumery.

**GUNDS, D. and W.**, Milton Street (Class XXIX., No. 305A, p. 818). Prize Medal. These exhibitors are among the few British soap-boilers who also perfume their soaps for toilet-purposes. Their soaps for manufacture use compo:—a perfectly neutral Curd-soap, employed by woolen and silk manufacturers for the more delicate goods; soap used by silk dyers to give brilliancy to their goods; and a Black-soft-soap made from the fats recovered by Mr. Bawson, from waste lyes (see the article on Candles, page 818): it is chiefly used for scouring coarse wools, and carpets, and is sold wholesale at 2d. per lb. The household soaps comprise White-curd of excellent quality; Mottled equally good; and very fine Pale-yellow-soaps. The Toilet-soaps exhibited are chiefly those ornamented with insaid, embossed, and coloured camoes. They are well perfumed, and give a good lather. The Shaving-tablet, contained in a gutta-percha case with a moveable bottom, is one of the very best possible contrivances for that purpose.

**GRAS, JUAN**, Malaga (Spain, No. 244, p. 1264). Honourable Mention. Three bars of Olive-oil-mottled or Castile-soap, made in the ordinary manner, in the large boiler. The alkali used in its formation is barilla, which, as before stated, was at one time the only source of carbonate of soda; but it is almost entirely superseded in other parts of Europe by that prepared from sea-salt.

**GROSVENOR, JOHN**, 59 Friday Street (Class XXIX., No. 13, p. 789). Prize Medal. The Jury award a Prize Medal to this Exhibitor for his Perfumery and the manufacture of Artificial-essences, applicable to the flavouring of confectionery and other purposes; for instance Pine-apple, Jargonilla, Onion, Oil-of-cinnamon; these artificial essential oils are generally used in the proportion of 1 oz. to a gallon of spirit of wine.

**HARRIS, JAMES**, Philadelphia (United States, No. 4, p. 1233). Prize Medal. Crystal-soap, Transparent-toilet-soap, very agreeable and well-manufactured. They added a good lather.

The perfumery which is exhibited, is not included in the Award.

**HARRIS, ROBERT**, Titchborne Street (Class XXIX., No. 10, p. 790). Prize Medal. A collection of soaps amongst which are some curious mixtures. Brown-Wind-ner-soap; Amber-soap containing amber-oil; Wax-soap used to mix with colours for distemper-painting; Petroleum-soap prepared with a mixture of 30 per cent. of Barbadoes tar, and 70 per cent. of soap; this soap is intended to be used as a remedy in cutaneous affections. Benzoin-sandaline-soap, which is a soap prepared with a mixture of almond-meal and gum-benzoin.

M. Hendrie exhibits likewise a large collection of very good Perfumery.

The Jury have not pretended to discuss the merits of the unusual compounds; but make their Award on the general excellence of Mr. Hendrie's Perfumery and Toilet-soaps.

**KENDALL and Co.**, Dublin (Class XXIX., No. 25, p. 790). Prize Medal. These manufacturers have exhibited two cases containing twelve very large blocks of Marbled-soaps, besides sixty boxes of various Fancy-soaps. All the soaps are made by the "cold-process," and consequently contain the glycerin resulting from the saponification of the fat. The materials used in their formation are lard, and a very pure soda-lye. Great care has been bestowed by Messrs. Kendall and Co., in the manufacture of these soaps.

**KNIGHT, JOHN**, 9 Old Gravel Lane, St. George's (Class XXIX., No. 8, p. 790). Prize Medal. Most excellent Primrose or Pale-yellow-soap, made with tallow, American rosin, and soda; Mottled toilet-soap for household purposes, equally good; Soft or Potash-soap, having the fig-like appearance, which is much esteemed as an indication of careful manufacture.

**LANDON and Co.**, Paris (France, No. 1290, p. 1238). Honourable Mention for Aromatic-vinegar for toilet-purposes, very refreshing, and free from adhesive residue on evaporation.

**LANGDALE, EDWARD F.**, 83 Upper Thames Street (Class XXIX., No. 55, p. 792). Honourable Mention. A collection of Artificial-essences, now much used for flavouring confectionary and beverages, consisting of the following:—Oil-of-Cognac, Oil-of-Pears, Oil-of-Apples, Oil-of-Pine-apples, Oil-of-Grapes. The Jury accord an Honourable Mention to this Exhibitor for the successful preparation of these various ethers applicable as a substitute for natural fruits.—See pages 608, 609.

**LEISTNER, G. L.**, Paris (France, No. 908, p. 1223). Prize Medal. Excellent Aromatic or Toilet vinegar; Creosote; Eau-de-Paris, a fragrant and agreeable perfume, resembling Eau-de-Cologne, but possessing a characteristic odour of its own.

**LIEFF, FREDERICK VAN**, Düsseldorf (Prussia, No. 656, p. 1086). Honourable Mention. For an agreeable perfume, called Düsseldorf water.

**MARTIN, MARIA CLEMENTINE**, Nun at Cologne (Prussia, No. 425, p. 1074). Prize Medal. Eau-de-Cologne of very superior quality, being that which was considered the most fragrant and agreeable in the Exhibition. The same odour was found to be persistent throughout the evaporation of a small portion, none of the essential oils becoming distinguishable, which is frequently the case with the inferior descriptions. Also Melisse Carmelite spirit, or holy water (alcohol).

**MELSER, D.**, Hermannstadt (Austria, No. 44, p. 1009). Honourable Mention. The Jury accord an Honourable Mention to the Olive-oil-soap, Fancy-soaps and Floating-soap, which are of fair quality.

**MILLAR, JAMES**, Marseilles (France, No. 929, p. 1224). Prize Medal. White Marseilles or Olive-oil soap. This is a good specimen of the kind to which Marseilles gives its name, and for which it is celebrated.

**OGON, J. L. M.** (France, No. 929, p. 1225). Prize Medal. Collection of Household and Toilet-soaps in bars and cakes. The household-soaps are excellent, and the toilet-soaps agreeably perfumed; one of these, the Jasper-soap, has a very peculiar jasper-like mottling, not seen in English soaps. The collection also comprises Floating-soap; white Marseilles or olive-oil-soap; tallow or Curd-

soap; rosin or Yellow-soap. This collection is very important, and highly interesting, and consists entirely of soaps of the very highest class.

PALIZ, A., Berlin (Prussia, No. 263, p. 1068). Prize Medal. Palm-oil-soap and tallow Mottled-soap (with a peculiar wavy mottling), of excellent manufacture and great detergent power. Both the soaps are free from any efflorescence of neutral salts, although they have become very dry.

PEARS, A. and F., 91 Great Russell Street, Bloomsbury (Class XXIX., No. 24, p. 790). Honourable Mention. The Jury accord an Honourable Mention to Messrs. Pears for a small collection of Transparent-soaps, the manufacture of which they allege their father invented upwards of forty years since. The Jury tried one ball of the soap which was stated to be twenty-five years old, and found it, though much darker in colour, to be very good. The price of spirit of wine in this country has prevented Messrs. Pears from obtaining a very large sale for this soap, but in America its manufacture is carried on to a considerable extent.

PIVET, L. T., Paris (France, No. 1678, p. 1257). Prize Medal. Various kinds of Toilet-soap; spirituous Perfumery; perfumed Hair-oil and Pomatum; Transparent-potash-soap or Shaving-paste. Two soaps are especially deserving of notice, that called Lettuce-soap, and the Orange-flower-soap, as being perhaps even more agreeable than the others. All M. Piver's perfumes and soaps are of the very highest class.

RIMMEL, E., 39 Gerrard Street, Soho, and Paris (Class XXIX., No. 3, p. 789). Honourable Mention. The Jury accord an Honourable Mention for the Perfumery exhibited, which is of good quality. Besides these there are Hair-dye, Perfumed-bouquets, Pomatum, &c.

SARKE, H., jun., Berlin (Prussia, No. 255, p. 1063). Prize Medal. A block of Palm-oil-soap, and Tallow-curd-soap, well manufactured, of great detergent power, and free from any efflorescence.

SZIEB, H., Warsaw (Russia, No. 364, p. 1383). Prize Medal for Brown Windsor-soap, Floating, and other Toilet-soaps, well manufactured and very agreeable.

It is curious to find that the name "brown Windsor," should have been adopted even in so distant a locality as Warsaw. The soap, moreover, has a great resemblance to that manufactured in this country.

TAYLOR, H. P. and W. C., Philadelphia (United States, No. 292, p. 1463). Prize Medal. A very large collection of Transparent-soaps, some of which are quaintly arranged to form a window, in imitation of stained glass. They are very agreeable, and afford an excellent lather.

TAYLOR and SON, King's Road, Chelsea (Class XXIX., No. 5, p. 790). Prize Medal. These Exhibitors are perfumers of the soaps which they buy of the soap-boiler, and they have carried to great perfection the art of perfuming and mixing the various sorts of soap so as to produce agreeable compounds for the toilet. The "Old Brown-Windsor-soap" is particularly to be distinguished as one of great excellence. The other soaps are Almond, Otto-of-rose, Lavender, Honey, and Shaving. Besides soaps, Messrs. Taylor and Son exhibit spirituous and aqueous Perfumes, of which they are the distillers, and which possess the fragrance of the respective flowers. The Rose-water, Elder-flower-water, and spirituous Lavender-water, may be cited as examples of great excellence. The spirituous perfumes comprise "Pure Lavender-water," "Perfumed-lavender-water," Millefleurs and Eau-de-Cologne; the aqueous perfumes are Rose-water, Honey-water, Peppermint-water, and Dillseed-water.

THOUZON, Grenoble (France, No. 1701, p. 1257). Honourable Mention. Concentrated essences for flavouring liquors; these are very numerous; some resemble the flavours of the fruits which they are intended to imitate, whilst others require a little imagination on the part of the epicure.

TOUCHE-GRASSE, E., St. Laurent, Antwerp (Belgium, No. 484, p. 1164). Prize Medal. Excellent Toilet-soaps, affording a very abundant lather. The collection comprises very good Olive-oil, or Marseille soap; tallow, or Antwerp soap; marbled Antwerp soap; and Toilet-soap;

scented Palm-oil-soap, which is most agreeable for the toilet; also a toilet soap called "Savon d'adoucissement" (emollient soap).

TRY or TRYER (Tunis, Nos. 55 to 57, p. 1415). Prize Medal. A collection of a variety of Perfumed-waters (not spirituous). There are Ninety bottles of these perfumes, amongst which may be cited Rose-water, Quince-water, Apple-water, Musk-water, Jasmine-water, which is very fragrant; Millefleurs-water, composed of jasmine and other perfumes; White-rose-water, Aloe-water, Benzoin-water, Citron-water, Cinnamon-water, Caraway-water, Orange-flower-water, water distilled with a mixture of benzoin and other perfumes, Cedar-wood water. Also perfumed tablets and necklaces worn by ladies; these are composed of a paste made of amber, musk, and aloe. Likewise jasmine pomatum.

The greater portion of the perfumed waters are very fragrant; some few are peculiar, and to persons unaccustomed to their use not agreeable.

WILLIAMS, JOHN, and SON, 28 Compton Street, Clerkenwell (Class XXIX., No. 4, p. 790). Prize Medal. A collection of soaps for manufacturing and household purposes, and also perfumed toilet soaps. These Exhibitors are soap-boilers, as well as soap-perfumers, a combination of two, generally, distinct branches. Their common soaps are exceedingly well manufactured, and are possessed of great detergent properties. The collection comprises, Olive-oil-soap, which is much used by the fine-cloth manufacturers; White-curd (tallow) soap, used principally by the lace bleachers; Pale-yellow and Mottled-soap, for household purposes; Scouring-soap, containing designedly an excess of alkali, which effloresces on the surface; this soap is made chiefly for consumption at Leicester. It answered well for washing in a strong brine, and therefore might be used on board ship.

The fancy-soaps are agreeably perfumed, and give readily an abundant lather. The principal description of toilet-soaps are Brown Windsor, Rose-soap, and the so-called Honey-soap.

WUNDER, L., Liegnitz (Prussia, No. 250, p. 1063). Prize Medal. Tallow-soap, with peculiar wavy mottling, very well manufactured; Palm-oil-soap, of good quality, and excellent white Curd-soap; the Award is to the foregoing. Besides these, there is a toilet-soap called Ananas-soap, the perfume of which does not at all resemble that of the pine-apple, and is moreover very disagreeable.

YARDLEY and STATHAM, Vine Street (Class XXIX., No. 2, p. 789). Honourable Mention. A soap called the "genuine Honey-soap," is very good, and gives an excellent lather, but it does not contain any honey. At one time honey was put into toilet-soap, but was discontinued in consequence of the unsightly appearance it produced; the name, however, is still retained. The other soaps exhibited are, the "True Winter-soap," Heliotrope-soap, White and Brown Windsor-soap, which are equally good.

Many of the Toilet-soaps are stated to have some peculiar emollient and whitening effects on the skin; it is, however, to be hoped that the public will soon become sufficiently enlightened to buy the soaps for their real and not for their fabulous qualities.

## II. CANDLES.

In tracing the little which is known respecting the early history of Candles, it is impossible to avoid the mention of Lamps also (although these were not amongst the articles submitted to the consideration of this Jury), as both are intimately connected not only in their history, but also in their philosophical bearings; for however much candles and lamps may differ in other respects, they are identical in this, that both are contrivances in which, for the purposes of illumination, a wick of fibrous material is employed to effect the combustion of fatty bodies; which, for the most part, under ordinary circumstances, could be ignited only with difficulty, and if ignited, would soon become extinguished. The chief point of difference is, that in the lamp the fuel is a fluid, at the common temperature; whilst in the candle it is liquified only gradually, and in the required quantity, by the heat of the flame. This distinction, however, does not entirely hold good, for it is known that in many

countries, especially in those where oil-yielding plants are not common, animal-fat is employed for feeding lamps; and it is even probable that the ancient Hebrews may likewise have used occasionally solid fats for the same purpose. The modern mortar night-light is also a lamp of this kind.

Frequent mention is made of the candle in the Old and New Testaments, in metaphorical as well as literal significances; but from the description of the candlestick of gold which Moses made by the command of God, it is more than probable that the Hebrew expression translated "candle" really means lamp,\* for in *Exodus* xxv., after the minute description of the form of the candlestick, with its six branches, it is said, at verse 37, "And thou shalt make the seven lamps thereof, that they may give light over against it." Again, in *Leviticus* xxiv., v. 4, the Lord directs that Aaron shall order the lamps upon the pure candlestick; and in verse 3 of the same chapter, the fuel used in the lamps is shown to have been olive-oil.

Torches† may be regarded as a coarse description of candles, which indeed possibly originated from them. They are mentioned also in Holy Writ, in a passage, remarkable as being the only one in the New Testament where the *lampion* is spoken of (*John* xviii., v. 3): "Judas then having received a band of men and officers from the chief priests and Pharisees, cometh there with *lampiones* and torches and weapons."

The information respecting candles, mentioned in Pliny's *Natural History*, is very slight and ill-defined. That which is most to the present purpose is contained in book xlii., chap. 13, where in describing the books reported to have been found in a perfect state of preservation in the grave of Numa, 535 years after his interment, the author states that they lay near a quadrangular stone in a box which was bound all over with *candles*, and to that defence their preservation is ascribed. From this passage it would appear that candles were employed in the earliest ages of the Roman history; and, inferentially, that they resembled in some degree either our longest wax-tapers, or else match-lights made of pitched rope, for short candles could not have been bound round any object.‡ In describing in book xvi., chap. 37, the "brittle rushes" that grow in marshy districts, he says that they serve to thatch houses and make mats; and the pith of them, when the rind is peeled off, is used for making wicks for *watch-candles* and funeral-lights, to burn by dead bodies whilst they lie above ground. This description may be considered as referring to candles very similar to, if not identical with the modern rushlight; but as the fat used in their formation is not alluded to, nothing certain is known on the subject.§ In book ix., chap. 1, where speaking of flax, Pliny remarks that the fibres nearest the rind are only fit for lamp and candle wicks; and in book xxxvii., chap. 35, that if the scrapings of amber are put into oil, they will burn and

maintain light both longer and more clear than wicks made of the best of flax: from which it would appear that, although the refuse flax was usually appropriated to lamp and candle wicks, the best flax was sometimes used for them.

As regards the fuel used in lamps, in addition to the mention of oil, Pliny, in book xxxvi., chap. 13, states farther that the inhabitants of Sicily burned a kind of bitumen, resembling an unctuous or oily liquor, in their lamps; and that they collected it from the surface of a spring in the territory of Agrigentum. Although in book xxi., chap. 14, various kinds of bees'-wax are mentioned, and the method of wax-bleaching is minutely described, which, it may be remarked, somewhat resembles the process employed in the present day,—no allusion is made to the application of wax to the manufacture of candles; nor in speaking of tallow and other animal-fats, and their separation from the cellular tissue, is it stated that they were employed for candles.

From Fosbrooke (*Encyc. Antiq.*, p. 473, 4to Edit.), who copiously refers to most of the best authorities elucidating this subject, the principal of which have been carefully examined for this Report, we learn that wax was employed by the classical ancients for candles; the wick was made of rope and leaves of the papyrus, and such candles were carried by children at marriages, and were used at funerals. And the same authority (p. 405) adds that their illuminations were made not only with lamps, but also with links and wax-flambeaux.\* He states, moreover (p. 240), that the rich Romans used lamps, and the poor employed candles. Beckmann has recorded a notice that the Emperor Constantine, about the beginning of the fourth century, "caused the whole city of Constantinople to be illuminated with lamps and wax-candles on Christmas-Eve." (*Hist. of Inv.*, Bohn's Edit., ii. p. 174.) Apuleius distinguishes wax and tallow candles by the terms *Cerei* and *Sabaei*.

In the middle-ages, continues Fosbrooke, wax-candles were made of various sizes, some exceedingly small, and others weighing so much as 50 lbs.: they were made in moulds, the wicks being formed of twisted tow. He likewise states that they were made at home in gentlemen's houses. Whilst describing the architecture of the Britons, Anglo-Saxons, &c., he mentions that *tapers*, ornamented with flowers,† were used on high festivals to burn before particular images, and be borne in procession. That wax-candles were not made in the Saxon period by regular chandlers as now, appears from the description in *Asser's Annals*, translated for Bohn's *Sir Old English Chronicles*, p. 84, of King Alfred's device for marking the hours of the day, by the consumption of wax-candles (six of which, lighted in succession, burned exactly twenty-four hours). It there appears that "he commanded his chaplains to supply wax in sufficient quantity, and he caused it to be weighed in such a manner that when there was so much of it in the scales as would equal the weight of seventy-two pence, he caused the chaplains to make six candles thereof, each of equal length, so that each candle might have twelve divisions marked across it."

There can be no doubt, however, that the occupation of the wax-chandler existed in England at a very early period, as well for the manufacture of tapers for religious rites, as for the preserving of the bodies of important personages in waxed cloths, which was called *Cerifying* them. Hence the art was probably practised chiefly, if not exclusively, in monasteries; the tenants, of which paid several of the rents in kind, and one of these was delivered in wax, and called *Cerage*. The persons whose office it was to make this wax into pence and tapers were termed *Cerarii* and *Cerarii*, and Duncanson shows them to have existed so early as A.D. 778. In 1397, John of Gaunt, Duke of Lancaster, directs by his will that his body should be carried direct to the Friars-Carmelites in Fleet Street, but that there should "be no *cering* or embalming of his corpse;" indicating that this operation was probably even then performed by ecclesiastics. In 1453, however,

\* In Lane's *Manners and Customs of the Modern Egyptians* there is a description of a folding-laftron of waxed cloth, and the lamp which is put into it. This, in Arabic, is called *Chanderi*, with which our word candle may possibly have some connexion; for it is more than likely that the same word was used to designate in former times either lamps or candles.

† British Guiana has contributed an interesting specimen of torch-wood from the river Demerara, which, when beaten so as to separate the fibres, is used for torches by the Indians. It is supposed to be obtained from a species of *Amphis* or *Jatropha*.

‡ The same story is also related by Livy, lib. xl., c. 23, with the additional statement that the books were bound round in a package with two candles; which seems to indicate that flax formed into torches with pitch or wax, were employed, simply to hold the manuscripts together. These torches probably resembled the tarred string used for the purposes of illumination in the present time by workmen engaged at night in spring down gas or water pipes.

§ The description of the Irish candles in Fosbrooke's *Encyc. Antiq.*, p. 240, however, throws much doubt upon this position. It is there stated that they were formed, like those of other nations, of twisted rushes dipped in butter or grease, and pressed in large vessels. (Lantern, Ireland, 1790, p. 240.)

\* *Annal Teck.*, lib. iii. c. 2. Edit. Lps., p. 78, n. 31.

† Some examples of wax-candles, ornamented in this manner, are exhibited in the Museum Department.

a contemporaneous authority states that the Princess Elizabeth, daughter of Henry VII., "was cared by the wax-chandler." Dugange shows that *Candelarii*, or persons who made and sold candles, were known in the middle of the thirteenth century.

By the sixteenth century the trade of wax-chandler was probably extensively established in England. In Brand's *Papier Antiquities* (vol. i. p. 29, Edit. Knight), is an extract from the churchwarden's accounts of St. Martin Outwich, London, under the year 1510:—"Paid to Randolph Merchante, wax-chandler, for the Pascall, the Tapers affore the Rode, the Cross candelles, and Judas candelles, ix. liii<sup>d</sup>." In the *Memoirs of the last Two Years of the Reign of Charles I.*, by Sir Thomas Herbert and others (p. 138), is described the night-light used in his chamber as "a cake of wax set in a silver basin, that then, as at other times, burned all night;" this description referring to the years 1646-1649 closely agrees with some of the forms of the modern mortar night-lights. Long-coiled Wax-Tapers were manufactured in the 17th century in Venice, and the invention appears to have been brought to Paris about the middle of the same century by Pierre Mesmure, of that city.

In the year 1775, the Rev. Gilbert White, in his *Natural History of Selborne*, pp. 198 and 199, 4to edit., describes the method of making Rushlights then practised by the cottagers of Hampshire, from which it might be inferred that they must have closely resembled those made by the ancients. A full abstract will be found in Tomlinson's *Cyclopædia*, p. 290, whence the following passage is taken:—"A pound of rushes (*juncus effusus*), containing 1,600 individuals, was coated with 6 pounds of tallow, so that 228 lights weighed one pound, and cost a little over 5d. The rushes were peeled on three sides for the best lights, and on two only for watch lights, which were not required to give so much light, and which, Gilbert White says, 'it is true only shed a dismal one—darkness visible.' Of the other kind he says, that "a good one, which measured 2 feet 4½ inches in length, burned 57 minutes;" and that he was assured by an experienced old housekeeper that 1½ lb. of rushes, after having been coated with tallow, completely supplied his family for a year. The cost of lighting with rushes he estimated at one farthing for ½ hours, whilst a halfpenny candle in the "blowing" open rooms of the poorer cottagers only lasted 2 hours.

In the year 1799, William Bolts took out a patent in England for improving the form, quality, and use of the candle, the specification of which probably contains the first account of an attempt at the improvement of the quality of candles made from tallow and other animal fats, by subjecting the material to a considerable pressure during the act of cooling, and which, in effect, is the preparation of the so-called *Stearine* from fats. He likewise describes a solid candle with a short wick, which is placed in a holder, and kept pressed on the end of the candle by a spring, or else the candle is placed in a tube and pressed against the wick by a spiral spring; as well as other contrivances, some of which have been revived and successfully carried out in our own days.

The object of the preceding notices, incomplete as they are, is merely to enable the reader to form some idea of what may be gleaned relating to the various means of producing light at different periods, and especially regarding the construction and materials of the candle. Great interest, indeed, would be attached to a complete history of *Domestic Illumination*, tracing its gradual development from the solitary watch-lantern graven on the Pyramid, through the graceful but very imperfect lamps of the Greek and Roman period, as exhibited in our museums, and the clumsy contrivances of the middle-ages, up to the productions of modern times, satisfying the demands both of taste and science. In such a narrative might be shown the progress of light, in the literal signification of the word, by a careful examination of the various forms in which it has been at different times employed, as lamp, lantern, torch, flambeau, salot or cresset, candle, and gas; whether for the celebration of religious ceremonies, for increasing domestic comfort,

adding to the security of the streets of towns, or forming a beacon to guide the mariner at night\*. It would be, at the same time, a history glancing at the advancement which the improvements in illumination have given to the social condition of mankind; and at the advantages which science has derived from the study of this subject. Nor would entertainment or interest be wanting, in the recital of the many superstitions connected with the burning of lamps and candles; the shape of whose flame trembling in the moving air, and whose wick, bending or spreading under the influence of heat, has been suggestive to human imagination from the time of Pliny up to the enlightened days of our own century. Such an inquiry, however, even were it possible with the time and the materials which are at the disposal of the Reporter, would far exceed the limits assigned to this Report. The same restriction as to space prevents them from following step by step all the various mechanical contrivances which have been invented in recent times to facilitate both the manufacture and combustion of candles. The Reporters cannot, however, refrain from entering into some details regarding the remarkable chemical improvements which have occurred within the last thirty years; especially since they possess the additional interest of being the result of investigations of a purely scientific character, undertaken without any view to their ultimate practical application. In the present day it is too much the custom to require an instantaneous practical result, much to the detriment of the persevering prosecution of abstract science: the numerous, brilliant, and continually occurring proofs of that most important truth are too often overlooked, that all truly scientific studies tend to increase, sooner or later, not only the intellectual, but also the physical wealth of nations; and materially benefit the world at large.

#### (a.) Tallow-Candles.

The ordinary tallow-candle labours under many disadvantages, which are so well known that they scarcely require to be specified. It has an unpleasant odour; which becomes more marked whilst burning; and the attempts at supplying it with a self-consuming wick have been only partially successful on account of the low fusing-point of the tallow. The slightest draught, from the same reason, causes the tallow to melt in larger quantity than can be consumed by the burning wick, and it therefore gutters down; this renders the tallow-candle ill adapted for being carried about a house, as grease spots are apt to be produced which are very difficult of removal;† to which we may add that it cannot be handled without soiling the fingers.

The disagreeable smell of tallow-candles arises chiefly from the tallow being imperfectly purified; for if it contain a portion of the cellular tissue of the fat from which it is obtained, this putrifies and communicates the process of decomposition, like a ferment, to the fatty matter, which becomes rancid and evolves a most unpleasant odour. This is always the case with tallow as it occurs in commerce, which, although fit for the scap-boller, is too impure to be employed by the candle-maker without clarification. The first step towards the improvement of tallow-candles was made in the recognition of this fact; more attention was in consequence bestowed upon the manner of purifying or "*Rendering*" the tallow, as it is called. In England the "*rendering*" is effected by melting the tallow in an open copper pan exposed to the direct action of the fire. After it has remained in a fluid state for some time, the water which the fatty particles contain evaporates, and they then rise to the surface and are skimmed off and pressed. The pressed cake is called "*greaves*," or "*cracklings*," and is used for feeding dogs. On the Continent, however, D'Arnot's method is now universally employed, which has also been adopted in Ireland: it consists in treating the raw tallow melted by

\* For a history of the "*Lighting of Streets*," the reader is referred to *Bechmann's Hist. Inc.* (Rome, vol. II, p. 173.)

† Common ether is one of the best vehicles for the dissolution and removal of oil or grease spots.

steam-heat with very diluted sulphuric acid, for the purpose of destroying the cellular tissue. This method, besides being much safer, yields three per cent. more tallow than the older process; and though it does not entirely remove the smell, essentially improves it. The purification of the tallow, at the same time, induces an amelioration in the flame of the candle, more particularly in point of uniformity in the development of light; as the cause of the frequent obstruction of the wick during combustion by less combustible nitrogenous substances is removed.

Less success has attended the attempts to supersede snuffing, which still continue a necessary appendage to a candlestick with a tallow-candle. The plaited wick which, as we shall see farther on, followed in the wake of stearic candles, is not applicable to the tallow-candle without some special contrivance, as in curling over outside the flame (by which it becomes consumed) it causes the tallow to melt in such large quantities that a considerable guttering is the consequence. It is therefore necessary to protect the candle if a self-snuffing wick be employed; this is effected in Palmer's lamp. Here the candle is enclosed in a vertical metallic cylinder with a cap whose orifice is smaller than the candle; as the candle is consumed a spiral spring presses it upwards against the cap. This contrivance much resembles the plan proposed by W. Bolts in 1799, and to which allusion has already been made.

The next improvement in the tallow candle was effected by a reduction of the fusibility of the materials employed. This was first done by the same inventor, W. Bolts, but received further development from Chevreul's researches. The observations of this celebrated chemist, to which we have already alluded in our article on soap, showed that all varieties of solid fats might be split into a solid crystalline fat (stearin and margarin) and an oily liquid (olein);\* in his laboratory experiments this separation was effected by means of solvents; but subsequently it was found that by attending to the temperature of the fat, it might for all practical purposes be produced equally well by pressure. Common tallow melts at between  $37^{\circ}$ – $40^{\circ}$  C. ( $99^{\circ}$ – $104^{\circ}$  F.). The melting-point of stearin is  $62^{\circ}$  C. ( $144^{\circ}$  F.). By removing a considerable portion of the olein from the tallow, its fusing-point was consequently raised, and thus a great evil removed. Candles have been repeatedly made of pressed tallow; they fairly deserve to be called stearin-candles, while those that now go by that name actually do not merit the appellation.

To prepare stearin, tallow is melted and allowed to cool as gradually as possible, with constant agitation, so that the stearin and margarin may crystallize; at  $35^{\circ}$  to  $38^{\circ}$  C. ( $95^{\circ}$  to  $100^{\circ}$  F.) the mass becomes pasty, and is subjected to slow pressure in cloths. By repeating the operation, the stearin is obtained gradually of greater purity.

Cocoa-nut-stearin is very largely employed in England to mix with stearic acid, to form composite candles, the neutral fat appearing to be better adapted for this purpose than the fat acids which may be prepared from it; but on the Continent it is but little used.

As regards the employment of tallow-stearin, many obstacles have stood in the way of its development which might, there is little doubt, have been removed by persevering investigations, had not the more careful researches into the nature of the process of saponification of fats, and the separation of solid acids from the fatty bodies, the result of these researches, directed the inquiry into a new channel. When it was found that stearic acid fusing at  $70^{\circ}$  C. ( $158^{\circ}$  F.) could be obtained from stearin fusing at  $62^{\circ}$  C. ( $144^{\circ}$  F.), and margarin acid with a melting-point of  $69^{\circ}$  C. ( $149^{\circ}$  F.) from margarin fusing at  $47^{\circ}$  C. ( $107^{\circ}$  F.), while the oleic acid remained as fluid as the olein from which it was derived, it became evident that the difference in the fusing-points of the solid and liquid acids being so much greater, the separation of the

former from the latter might be effected without difficulty. Thus the transition of the tallow-candle to the stearic candle was effected.

Tallow-candles are of two kinds, "dips" and "moulds." Dips are made by dipping the wick repeatedly in melted tallow; allowing a sufficient time to elapse between every operation, in order that each coat may consolidate.

Mould-candles are usually made in pewter moulds, although glass moulds have been lately introduced. The mould consists of two parts, a cylinder and a conical cap, which is perforated to allow a passage for the wick. Several of these moulds are fixed in a wooden frame, the upper part being formed like a trough in which the open end of the mould is inserted, the capped end pointing downwards. To insert the wick, the frame is laid on its side and a long wire with a hook at one end is passed through the hole in the cap; the wick is then attached to the hook by means of a loop which is formed in it; on pulling back the hook the wick is drawn with it. A wire is now inserted across the top of the mould and through a loop at the other end of the wick; lastly, the wick is drawn tight through the cap, and a small wedge of wood is inserted to keep it in its place. The moulds are filled by running the melted tallow into the trough, and are then allowed to cool until the next day.

There have been several improvements of late years in the mechanical arrangements for the manufacture of tallow-candles, which it would be difficult to describe clearly without engravings; these have tended much to lessen their cost, and consequently the consumption continues very considerable; still it may be expected, notwithstanding their moderate price, that they will be gradually superseded by the more elegant and harder candles of stearic acid, or of compounds of stearic acid with solid neutral fats, which have the advantage of being self-snuffing. As yet the general introduction of stearic candles is impeded by their price, but we may confidently hope that the progress of science will soon afford us the means of still farther reducing their cost of production, and thus render the use of the tallow-candle less frequent in the dwellings of the poorer classes of society, as it has already disappeared from the homes of the middle classes.

It is remarkable that the ordinary tallow-dip candle is not exhibited by any nation whatever, although there must exist far more makers of this kind than of any other.

#### AUSTRIA.

This is the only foreign country which has contributed tallow mould-candles. They are sold at 19 kreuzers per Austrian, or  $5\frac{1}{2}$ d. per English pound; which is a half-penny more than for superior candles may be bought for in Ireland.

#### BRITISH COLONIES.

Two colonies, namely *Nova Scotia* and *Van Diemen's Land*, have sent mould-candles, in which there is, however, nothing remarkable.

#### UNITED KINGDOM.

The manufacture of tallow-candles in the United Kingdom still continues to be a most extensive trade, notwithstanding the increasing consumption of gas, and the introduction of stearic and composite candles. Prior to 1831, when the duty on candles was repealed, they yielded an important revenue in Great Britain, as may be seen from the following statement (see p. 619). The duty, it may be remarked, was first imposed in 1803, and continued at the same rates from that period until 1831, viz., 1d. per pound on tallow, and  $3\frac{1}{2}$ d. per pound on wax or spermaceti candles. It did not extend to Ireland.

In 1830 the number of candle-makers in Great Britain was 2,695, who paid 500,048l. 14s. 1d. duty; since the repeal of the duty no record has been kept of their number, but judging from the tallow imported, it cannot be less than in 1830.

\* The American section contains several specimens of olein obtained by pressing lard, which, under the commercial name of lard-oil, is exhibited at Nos. 18, 19, 208, 209.

Of tallow-candles only 1,067 lbs. were imported in the same year.

In 1850 the quantity of tallow imported into the United Kingdom was 1,073,833 cwts.

There are Four Exhibitors of mould-candles, two English and two from Dublin. The Irish candles only are deserving of notice, and may be regarded as the perfection of tallow-candles; indeed it appears that the makers of Dublin have acquired a high reputation for mould-candles, by bestowing great care on the purification of their tallow and on the moulding.

The price of tallow-mould-candles is 5d. per lb.; those with waxed wicks, 5½d.; and the composite candles, formed of tallow and cocoa-nut-stearin, 8d. per lb.

#### (b.) Stearic Candles.

With this term we designate the candles made from the isolated solid fatty acids in contradistinction to those consisting of pressed tallow or lard (stearin), although in commerce both are called "stearine candles." The manufacture of stearin-candles is on the decrease, and tallow is now very rarely pressed. The stearin from cocoa-nut-oil (cocoïn) is, however, still prepared in considerable quantities, and mixed with stearic acid, and manufactured into the numerous kinds of composite candles which are so generally used in England. Compared with other fats, the importation of cocoa-nut-oil is not large; the following is the detailed account for 1850, from which it will be seen that by far the largest quantity comes from India:—

|   | Cwts.  |
|---|--------|
| Cocoa-nut-oil imported into the United Kingdom in 1850. |        |
| Cocoa-nut-oil imported from—                            |        |

| Total — — — — —   | 98,039 |
| Duty-free.  |        |

The foundation upon which the manufacture of stearic acid candles is based is the saponification of fats, and the separation of the fatty acids from the soaps, which the beautiful researches of Chevreul have made known to us. It would, however, be an error to suppose that these investigations alone solved the difficulty. Seven years, in fact, elapsed after the publication of Chevreul's discoveries, before they were successfully applied; but this can be a matter of no surprise to those familiar with the establishment of a new industry, and who are aware of the immense chasm which separates the laboratory of the chemist from the workshop of the manufacturer; they only can comprehend fully the obstacles of all kinds that must be vanquished, in order to fructify a purely scientific germ, and render it a healthy and vigorous branch of art.

The first steps in the manufacture of stearic candles were surrounded by difficulties of all kinds which frequently clouded the prospects of the enterprising inventors. Chevreul's experiments were published as early as 1823, but the idea of making candles from the isolated fatty acids does not appear to have been matured until two years later. At this period Chevreul allied himself with his celebrated colleague Gay-Lussac, with the intention of applying his discoveries to the practical purposes of life. In the year 1825 these two chemists took out a patent in France for the manufacture of fatty acids, and their application to the making of candles. Gay-Lussac took out, moreover, a patent in England in the name of his agent Moses Poole, on the 9th of June of the same year. The specification of these patents is highly interesting, as evincing a remarkable sagacity on the part of the patentees in anticipating the progress of this branch of industry; they call in aid all the agents which have been adopted up to the present day, even including the distillation of fatty acids with the aid of steam, which has only been brought into practical operation within the last ten years. Nevertheless the proprietors of the patents derived no benefit from them. The processes which they employed resembled too closely the proceedings of the chemist in his laboratory, rendering their industrial execution too costly. Although lime was specified by Gay-Lussac for the saponification of the fat, the ordinary alkalies continued to be employed; and for decomposing the soap, hydrochloric acid was used, the alkaline salts of which were never completely separable from the fatty acids. In their French patent Chevreul and Gay-Lussac even spoke of the necessity of cold and hot alcohol for

the perfect purification of the stearo-margaric acid. If we compare this proceeding with the present practice, we perceive that it had yet to pass through various ordeals.

A formidable and unforeseen difficulty presented itself in the fact that the new stearic candles would not burn with the ordinary wick; a long series of experiments were necessary in order to construct a wick which would not sputter the fat during its combustion. Chevreul and Gay-Lussac succeeded in doing this in the course of 1825, and indeed the plan was specified in the English patent before spoken of; they endeavoured to secure their invention in France by a rider to their patents; but this was not done until another inventor had taken out a patent for a similar contrivance.

A discovery like the separation of the fatty acids necessarily excited in many minds the desire for its practical application. Almost immediately after the publication of Chevreul's work, Cambacérés, an *Ingenieur des Ponts et Chaussées*, appears to have directed his attention to the utilization of Chevreul's investigations; at all events he took out a *brevet* for the improvement of the wicks of stearic candles in February 1825, which was prior to the date of the rider to Chevreul and Gay-Lussac's patent in France, and that of Gay-Lussac's in England: the value of the patents of these chemists was therefore considerably reduced. Cambacérés' first plan was a hollow wick, but in May of the same year he patented the plaited and twisted wicks, by which snuffers were rendered superfluous. The tension of the separate threads of the plaited wick causes the portion which rises from the candle to curl outwards, so that its point projects beyond the flame, and is rapidly consumed in the air that plays freely around it.

Cambacérés had observed that the wicks soon became clogged in the stearic candles, although this did not happen if they were used in ordinary tallow-candles; he ascribed this phenomenon to the formation of soaps produced by the action of the fatty acids on the carbonated alkali resulting from the combustion of the wick. Whatever may be the cause, he succeeded in removing the difficulty by treating the wick with dilute sulphuric acid; he supposed that the presence of this acid prevented the formation of soaps by combining with the alkalies in the ash to form sulphates.

Another essential improvement in this branch of industry was brought about by the introduction of the cheaper material, lime, as a saponifying agent, followed up by the decomposition of the lime-soap by dilute sulphuric acid. The merit of having successfully introduced the saponification by lime (*saponification calcaire*) belongs to De Milly, who has earned great praise by his contributions to the stearic manufacture. His plan formed part of the original patent of Chevreul and Gay-Lussac, and it redounds much to his credit that he brought a plan to bear which had failed in the hands of his illustrious predecessors. The saponification by lime, in an industrial sense, dates from 1831.

As the wicks were frequently corroded by the sulphuric acid used according to Cambacérés' preparation, De Milly, in 1836, took out a patent for employing the borate, phosphate, or sulphate of ammonia, for the same purpose. These improvements, and the endeavours of De Milly to promote the introduction of the new branch of industry in other countries, gradually caused its extension.

Nevertheless numerous difficulties still remained to be overcome. The limits of the present sketch will not permit us to do more than give the main features of the development of the stearic manufacture; we are unable, consequently to trace year by year all the little improvements which have taken place; but we cannot avoid a short notice of the numerous experiments necessary to prevent the crystallization of the stearic acid during the moulding of the candles. The first attempt made was to introduce another acid; and though successful in its immediate object, the choleic (arsenious acid) was an unhappy one, for it almost threatened the very existence of the stearic art. It was found that this deleterious substance was added in very small quantities, yet it was entirely incompatible with health, and was soon prohibited on the Continent by authority, and in England by equally pow-

erful public opinion. Here commenced all the manufacturer's troubles anew; in all directions he sought a substitute, and yet found none; at last, after innumerable experiments, and when almost driven to despair, he hit on two expedients—very simple when once found out—which answered as perfectly as the discarded plan. The means now employed are—the addition of a very minute quantity of wax to the stearic acid: a still more common plan is to allow the melted acid to cool down almost to the point of congelation before it is poured into the moulds, which are warmed to the same temperature as the fatty acids. The refrigeration and occasional stirring of the liquid fat produces a sort of liquid pulp, which congeals in the moulds without crystallization.

*Sulphuric saponification (Saponification sulfurique).*—While the stearic manufacture was gaining ground extensively, as we have indicated, a new art sprang up during the last ten years, having the same objects, and being based on the same foundations, but seeking the attainment of the goal by entirely different means—we speak of the saponification of fat by means of concentrated sulphuric acid, and subsequent distillation of the resulting fatty acids.

The origin of this proceeding must undoubtedly be sought in Chevreul's work; still E. Frémy deserves the credit of having, in an important paper, conspicuously exhibited the relations of fats to sulphuric acid. He demonstrated, in a treatise which he published in 1836, that the action of powerful acids on fatty substances has a close analogy to that of the alkalies. Both re-agents decompose the fat, but while the alkalies combine with the fats, and set the glycerin free, the sulphuric acid combines both with the acids and the glycerin; thus we obtain conjugate sulpho-acids, sulpho-stearic, sulpho-margaric, and sulpholeic acids, on the one hand, and on the other sulpho-glyceric acid. The first three are of a very ephemeral character; water decomposes them into slightly modified fatty acids insoluble in water, and sulphuric acid, which, with the sulpho-glyceric acid, dissolves in the water.

To George Gwynne is due the merit of having first described a method of obtaining fatty acids by the sulphuric saponification of neutral fats, and subsequent distillation of the resulting products. In a patent obtained in March 1840, he describes very fully his proposed plan for effecting this object, which consisted in distilling *in vacuo*, by means of an apparatus similar to that employed in sugar refining; the difficulty of sustaining a good vacuum on the large scale was, however, found to present so many obstacles that the plan was subsequently abandoned. Mr. Gwynne proposed also to distil, in the same manner, fatty acids obtained by means of lime-saponification, and even to obtain fatty acids by the distillation of neutral fats.

George Clark also directed his attention to the practical application of Frémy's experiments. On the 6th November 1840, he took out a patent for utilizing this property of sulphuric acid in decomposing fats, but without having recourse to their subsequent distillation: the difficulty in cost, however, of purifying the fat after decomposition rendered the attempt unsuccessful, notwithstanding that the quantity of sulphuric acid proposed to be used was only one-fourth the weight of the fat, whilst Frémy, employed, in his laboratory experiments, double this quantity. Farther experiments were still necessary to establish, on a firm footing, saponification by means of sulphuric acid, which ultimately again led to the adoption of an improved system of distillation.

In the patent before mentioned, which Gay-Lussac took out in England, and which is distinguished by its comprehensive treatment of the question, the distillation of fatty matters is spoken of, and the remark incidentally made that the process is much accelerated by the presence of moisture; this part of the specification was, however, never worked.

Nearly sixteen years later, on the 22nd August 1841, Dubrunfaut obtained a patent in England, and about the same time likewise one in France, for the purification of fatty bodies and their distillation. The plan proposed by M. Dubrunfaut was to heat the commoner oils to a high

temperature, and to pass steam through them, by which means their disagreeable odorous principle was intended to be removed. The distillation of fatty bodies was also claimed by Dubrunfaut, but the chief object of his patent was evidently the purification of common oils. By decomposing the neutral fatty bodies in this way, acrolein is produced, the vapour of which is so pungent and irritating, both to the eyes and the throat, that no workman can be found to endure it; hence this patent was not successfully worked, yet it contained a germ, which in the hands of Jones, Wilson, and Gwynne, was elaborated into the art now practised.

In an English patent, dated the 8th December 1842, and granted to William Coley Jones and George Wilson, we find the first application of the combined process of sulphuric saponification and steam-distillation. They decompose fats with sulphuric acid, aided by heat, and distil the fat thus decomposed by means of steam, which passes in minute streams out of a perforated coil fixed in the bottom of the still.

This combination of the sulphuric saponification and subsequent distillation solved the fundamental conditions of success; nevertheless a whole series of improvements followed, which essentially contributed to establish the present extension of this system of manufacture.

Patents taken out by Gwynne and Wilson, on the 16th November 1843, and on the 28th December of the same year, secured to them further improvements in this process; in the latter a method is described of reducing the quantity of sulphuric acid employed for decomposing the fats to from 10 lbs. to 6 lbs. for every 112 lbs. of fat, that is, to one-sixth, and even to one-tenth of the quantity employed by Frémy in his investigations. This saving was effected by heating the fat to 177° C. (350° F.) Another improvement was the heating of the steam in a series of pipes after it had left the boiler, instead of depending on the temperature of the fat to effect it.

Their last patent on the subject is that of the 30th October 1844, in which they propose to use a jet of super-saturated steam\* to heat the fats previous to sulphuric saponification. These patents embody all the plans which, since July 1844, have been in operation at the works of Price's Candle Company at Vauxhall and Battersea, of which Mr. Wilson is the managing director.

Similar manufactories, though not of such magnitude, have been established in other countries; the principal are those of Masse and Tribouillet, at Neuilly, near Paris, Motard in Berlin, Bert at Gijon (Spain), and of the Milly Candle Society in Vienna.

There can be but little doubt, after inspection of the candles in the Exhibition, that the process just described is applicable to the production of the higher class of candle, white, inodorous, and dry to the touch; but this is not the only part which it has filled up to the present time, it is in the treatment of palm-oil and cheap fatty bodies that it renders most valuable service. By its aid fats the most fetid and impure furnish candles of the finest quality; and thus it utilizes the waste of the glue-maker, and oily residues derived from the waste lyes of woollen and other manufactories.

We now proceed to describe the practical processes of the workshop, the various stages of which will be followed without difficulty after what has been said in the article on soap, and in the foregoing sketch respecting the constitution of fats and their decomposition.

(c.) *Description of the Lime Process as practised at Messrs. Ogleby and Co.'s Works at Lambeth.*

**Saponification.**—Into a large wooden vat, containing a coil of steam-pipes, pierced with small holes, ten tons of tallow are placed, with a quantity of water. The steam, when turned on, issues through the holes into the water, raises its temperature, and melts the tallow; as soon as the water has entered into brisk ebullition, a quantity of lime, in the state of thin cream, is added, and the ebullition continued for six hours, or until complete saponi-

fication is effected. From 10 to 15 parts of dry quick-lime are added for every 100 parts of tallow. The lime decomposes the tallow and combines with the resulting stearic, margaric, and oleic acids, forming a lime-soap (rock-soap), and sets the oxide of glyceryl at liberty in its hydrated state as glycerin, which dissolves in the water. The whole is allowed to cool in the vessel in which the boiling is effected, and the solution of glycerin run off.\*

The rock-soap, when cold, is reduced to a coarse powder by a mill, consisting of a pair of fluted rollers, over which an axis is placed, carrying tiger-like claws, which revolve between a series of horizontal prongs. The claws, by passing between the prongs, tear the large lumps into small pieces, which are then crushed by the fluted rollers.

**Decomposition of the Lime-soap by Acid.**—The ground lime-soap is now placed in lead-lined vats, supplied with a perforated copper steam-coil, each vat being capable of holding from eight to ten tons. When the temperature has reached the boiling-point, sulphuric acid, previously diluted, is added in the proportion of about 25 parts to every 100 parts of tallow employed. The sulphuric acid combines with the lime, forming an insoluble sulphate of lime, and liberates the oily acids which float at the top, and are then termed "yellow matter." This yellow matter is run off by cocks, placed at the proper level, into large spouted vessels, called "jacks," and poured from these into flat tin-moulds, in which it is allowed to cool and crystallize.

The sulphate of lime, after being well washed with boiling acidulated water to remove the adhering fat, is sold as manure.

**Pressing the Fatty Acids to remove the Oleic Acid.**—The cakes of yellow matter are interleaved with coconut mats (without being sliced and enclosed in bags, as was formerly the case), and subjected between iron-plates to a pressure of 600 tons in a vertical hydraulic press. A great portion of the oleic acid is thus removed, and the mixture of stearic and margaric acids rendered much whiter.

**Refining.**—The cold-pressed acids are then melted by steam in a lead-lined wooden vat, with a little dilute sulphuric acid, to remove any oxide of iron, or other impurity; poured into flat tin trays, and again allowed to cool and crystallize.

**Hot-pressing.**—The cakes of stearic acid, when cold, are put separately into a linen-bag, interleaved with coconut matting and iron-plates, previously heated by steam, placed in the trough of a horizontal hydraulic press, which is likewise heated by steam, and then subjected to great pressure for some time. By this operation the remainder of the oleic acid, holding a little of the solid acid in solution, is removed. The pressed cakes retain a small quantity of oleic acid at the edges; these are scraped off, melted, and again pressed.

**Second Refining.**—This process is simply a repetition of the first process of refining.

**Moulding.**—In the manufacture of the best description of stearic candles, the moulding is generally performed by hand. The moulds are of pewter, several being fixed in a wooden frame; these moulds are heated to a temperature approaching the fusing-point of the stearic acid, and are rapidly wicked, in the manner already described in speaking of tallow mould candles.

The wicks are all previously prepared by immersion in a solution of boracic acid, or the ammonio-salts of this and other acids, the preparation varying with the experience of different manufacturers. This preparation, called flux, serves to fuse the ashes of the wick into minute globules, which are frequently seen on the extremity of the wick, and which are readily dispersed, and also prevents the formation of earthy and alkaline soaps.

The melted material having been allowed to congeal to

\* Steam heated to a higher temperature, after it has left the boiler, than it can acquire if kept in contact with the water from which it is generated at any given pressure.

\* Until within the last four years the glycerin was a valueless product; its utilization is due to Mr. Thomas De La Rue, who, being engaged in experiments on its application in the arts, happened to observe its property of alleviating any irritation of the skin, and suggested to a medical friend its use in the treatment of cutaneous affections.

a great extent, is run into the moulds. After cooling, the candles which sufficiently to be removed with a few light taps on the frame.

The fusing-points of stearic candles are remarkably uniform, though manufactured by various makers in different countries; for example, those taken from Messrs. Ogley's case congealed at  $55^{\circ}\cdot25^{\circ}\text{C}$ . ( $131^{\circ}\cdot5^{\circ}\text{F}$ .), and one from De Milly's at  $55^{\circ}\cdot60^{\circ}\text{C}$ . ( $132^{\circ}\text{F}$ .) This coincidence is very remarkable. Stearic acid fuses at  $70^{\circ}\text{C}$ . ( $158^{\circ}\text{F}$ .) Margario acid at  $60^{\circ}\text{C}$ . ( $140^{\circ}\text{F}$ .) So that from the mixture of the two a compound is formed which fuses at a lower degree than either of the components, for it is almost impossible to assume that the solid acid should still contain a sufficient quantity of oleic acid to reduce its fusing-point to such an extent.

(d.) *Description of the Sulphuric Saponification and Distillation Process employed at the Works of Price's Patent Candles Company.*

**Sulphuric Saponification.**—About 20 tons of fat, say palm oil, are placed in a large lead-lined vat, and fused by a steam-jet. The fluid mass, after being allowed to settle, has now to be exposed to the combined action of concentrated sulphuric acid and heat, and for this purpose is pumped up into the acidifying vessel, in which its temperature is raised to  $177^{\circ}\text{C}$ . ( $350^{\circ}\text{F}$ .) The means of heating is a jet of low-pressure steam, which, in its course from the boiler, passes through a series of iron pipes heated in a furnace. The quantity of acid used is in the proportion of 6 lbs. for 112 lbs. of palm-oil. In this operation the palm-oil is decomposed and becomes much blackened. Withdrawn at that period it is seen that an important change has been effected by the action of the acid, as the mass now readily crystallizes to a tolerably solid fat. The fat is now drawn off from the acid and transferred to the washing tank, where it is boiled up with water by means of a steam-jet.

**Distillation.**—After one or two washings the blackened fat is withdrawn and pumped up to the supply tank, which commands the stills. The stills, which are made of copper, are heated by an open grate; each still is capable of holding five tons of fat. When charged, the temperature is raised to  $293^{\circ}\cdot5^{\circ}\text{C}$ . ( $560^{\circ}\text{F}$ .), and low-pressure steam passed through the mass; this steam is previously heated by passing through a system of iron pipes placed in a furnace.

The current of steam carries with it the vapour of the fatty acids, and thus facilitates the process. The mixed vapours of fatty acids and water pass together to a series of vertical pipes, which retain a temperature above  $100^{\circ}\text{C}$ . ( $212^{\circ}\text{F}$ .), where the fats only condense while the steam passes to a second refrigerator, cooled by a current of water; here it is condensed along with the minute quantity of fat carried over by it. A separating tank, from which the water escapes at the bottom; whilst the fats float on the top, serves to recover this small quantity.

**Distillation of the Residue.**—After continuing the distillation for a certain period, the residue in the still is transferred to another still formed of iron pipes, set in a furnace, and there submitted to a much higher temperature, and a jet of steam more strongly heated. The residue left in these iron stills is a sort of pitch, and is applied to the same uses as ordinary pitch; by this means an additional quantity of fatty acids is obtained.

The fatty acids, as they run from the still, are used to a great extent for the manufacture of candles without pressing, and form what are called Composite candles, which possess all the advantages of being self-analing, but are more fusible and softer than the pressed stearic acid candles.

A large proportion of the distilled fats, however, is pressed to make a better sort of candle, and for this purpose 80 hydraulic presses are employed.

**Cold-Pressing.**—The fats are spread by ingenious machinery on waxes made, and submitted to powerful cold pressure, between iron plates; the oleic, or metoleic acid, runs out, and is collected, and chiefly exported to Germany, where it is employed in soap-making.

**Hot-Pressing.**—After cold-pressing, the fat acids are

subjected to hot pressure, in hydraulic presses, confined in a chamber heated by steam. The pressed cakes, after the removal of the edges, are melted in contact with a little diluted sulphuric acid, and run into blocks. When the Reporters visited the works, the Company were distilling at the rate of 120 tons of palm-oil per week.

**Moulding.**—The moulding of the cheaper descriptions of candles is effected by ingenious machinery invented by Mr. Morgan, of Manchester, and improved by the engineer of the Company. By this machine 18 candles are moulded at one time; the wicks, 60 yards long, are wound on 18 separate reels, one for each mould. As one set of candles is pushed out by a series of plungers, they draw with them into the moulds the wicks for the next lot; these wicks being held temporarily with one clip, whilst the candles are held with another, are cut off close to the candles by a traversing circular cutter. Compound forceps, having 18 holders, now seize the wicks at the open end of the moulds, and hold them in their places; the plungers then return and draw the wick tight. The moulds, which during the operation have remained in a horizontal position, are now turned in a vertical direction, the small end downwards, and are then passed on a railway, to the person who is to fill them, they being heated to the proper temperature by their transit through a hot closet. They are then passed to other parallel railways and left to cool: after remaining a sufficient time to allow of the solidification of the candles, the moulds are brought back in succession by means of turn-tables to their first position. The forceps (which during the moulding have remained *in situ*) are now removed, and the frame of moulds again turned in a horizontal position. Eighteen plungers or pistons are made to press forward the loose bottoms of the moulds which correspond to the small end of the candle. In pushing these forward the candles are pressed out, and thus the cycle of operations is completed. It must be added that the return-stroke of the piston brings back the bottoms of the moulds against shoulders provided to keep them from falling out.

Pressed cocoa-nut oil is largely employed to mix with the pressed acids of palm-oil to make the best composite candles.

Price's Candle Company (Class IV., 83, p. 201\*) is the most colossal establishment in the world in this branch of chemical manufacture; possessed of five distinct manufactories, besides plantations of cocoa-nut trees in Ceylon, of a capital but little short of half a million sterling, and employing, notwithstanding the best arrangements for economising labour, 800 workpeople, it is not surprising that they divide annually in profits a sum equal to the gross returns of some of the largest continental works (between 40,000*l.* and 50,000*l.*).

The fusing-point of Price's Candle Company's candles of pressed distilled fats obtained by distilling palm-oil is  $51^{\circ}\cdot3^{\circ}\text{C}$ . ( $124^{\circ}\text{F}$ .); those prepared from the pressed fats obtained by distilling Chinese tallow (derived from the *Stillingia schifera*), according to a patent taken out on the 20th of December 1845, by Wilson, Gwynne, and Wilson, fuse at  $57^{\circ}\cdot7^{\circ}\text{C}$ . ( $136^{\circ}\text{F}$ .)

#### AUSTRIA.

In the Austrian Department there are Four Exhibitors of stearic candles, whose productions are generally of the highest character. The two principal are, firstly, the APOLLO COMPANY (39, p. 1069), which is the largest establishment in that country; having two manufactories, and employing about 600 workmen. These works produce about 1,000 tons of stearic candles, and 1,500 tons of soap, annually. The stearic candles of this Company are the whitest in the Austrian section. Secondly, the MILLY CANDLE SOCIETY (40, p. 1069), which was established in 1837, with the aid of M. de Milly, who instructed his brother in the art, and sent him to Vienna for that purpose. They have two manufactories, giving work to 200 people; they also employ machinery for moulding. In the one they produce, by the lime-process, 300 tons of candles, and 450 tons of soap, annually; in the other, they employ the distillation-process, and produce, by distilling palm oil, 300 tons of candles; in all, 600 tons of candles annually.

According to Mr. Buschek, the total annual value of the stearic manufactures in Austria is between 5,000,000 and 6,000,000 florins (428,572l. to 514,286l.); this includes the soap made as a secondary product from the oleic acid. Tallow costs 82s. per English cwt., and is reckoned to produce 45 per cent. of stearic acid, and 45 per cent. of oleic acid. Stearic acid sells at 66s. 3d. per cwt., and the manufactured candles at 112s. per cwt., which is an extraordinary advance on the price of the acid. Oleic acid sells at 18s. per cwt., and oleic acid-soda soap at 25s. per cwt.

#### BELGIUM.

The manufacture of stearic candles was introduced into this country by De Milly, in 1833, and has since attained a high state of excellence.

The manufactory of C. and J. QUANONNE (491, p. 1164), (who exhibit) was established with his aid; and they have adopted his name, of *Bougies de l'Etoile*, for their candles. They have six hydraulic presses, and produce annually about 240 tons of stearic candles, 70 tons of which are exported.

There are two other Exhibitors of candles from Belgium, viz.:—DELISTANCHE and LEROY (510, p. 1167), who employ 17 workmen, and produce 80 tons of stearic candles, 30 tons of which are exported; and CHARLES VAN CAMPENHOUDT and Co. (436, p. 1164), whose manufactory was only established in April 1850; they nevertheless have sent the finest specimens. At present they are producing at the rate of about 90 tons per annum.

The wholesale price of stearic candles is from 10d. to 1s. per lb.

#### CANADA.

The stearic candle manufacture has extended to Canada; which contributes the productions of a single manufactory: from what has been sent it is fair to anticipate that this art will soon be perfected.

#### DENMARK.

There is only one exhibitor of stearic candles in the Danish Department; his productions are very high in price (1s. 4½d. per lb.), a natural consequence of the high protective duty of 27s. 6d. per cwt. on candles imported. At present Mr. HOLMBLAD's works (27, p. 1357) are on a very small scale, producing only 30 tons of candles per annum. There are, however, two other manufactories established near Copenhagen.

#### FRANCE.

As the stearic manufacture was originated in this country, it was to be expected that there would be many Exhibitors representing this art, and that their productions would be of the finest quality, an anticipation which is confirmed by the result, for there are six Exhibitors of stearic candles by the lime process, and one of stearic candles by the sulphuric process, most of whom have been rewarded. There is likewise one Exhibitor of ornamented candles, which are, however, unimportant. M. DE MILLY (644, p. 1209), who was the first to apply the lime process successfully, established his manufactory of stearic candles in Paris in 1831, and gave the name of *Bougies de l'Etoile* to his products, because it was situated near the *Barrière* bearing that name; his manufactory now produces, on the average, 3 tons of candles per day. Since that period many other makers have sprung up in France; and there are now in Paris and its environs six makers besides De Milly, who collectively produce, at the least, 16 tons per day by the lime process. Besides which there are in the French provinces seventeen other manufacturers, who make collectively about 17 tons per day. These figures must only be taken as approximations; but they show, that in France alone, at least 7,400 tons of stearic candles are produced by the lime-saponification process. Besides these, MASSE and TRIBOUILLER, who employ the processes of sulphuric saponification and distillation, are mounted to distil about four tons of fat per day. They have exhibited a series of most interesting products, which are described in the List of Awards.

According to a statement furnished by MASSE and TRIBOUILLER (1846, p. 1240), the wholesale prices of the various stearic manufactures are as follow:—The best stearic candles, 11d. per lb.; second quality, 10d.; third quality, 9d.; candles made from unpressed distilled fat acids (composite candles) 7½d., 8½d., and 9d. per lb., according to quality; grease recovered from waste suds, 2d. per lb.; oleic acid, 3½d. per lb.; oleic acid soda-soap, 3½d. per lb.; and, lastly, paraffin-candles, 1s. 8d. per lb.; but it does not appear that they have yet been supplied in the way of trade.

Candles exported from France in 1850:—

|                          | lbs.      | valued at. |
|--------------------------|-----------|------------|
| Tallow-candles - - -     | 1,138,590 | 28,792     |
| Stearic-candles - - -    | 1,777,086 | 84,000     |
| Wax-candles (yellow) - - | 3,925     | 256        |
| (bleached) - -           | 113,227   | 10,334     |
| Spermaceti-candles - - - | 10,418    | 1,096      |
| All kinds - - -          | 3,038,246 | 124,478    |

#### HOLLAND.

Mr. BRANDON (70, p. 1145), who has sent very beautiful productions, established his works in 1839; he employs two steam-engines, five hydraulic presses, and about 100 workpeople.

#### INDIA.

Excellent stearic candles are sent from Coosypore (p. 922). Ceylon (p. 937) has contributed specimens of cocoa-nut stearin and olein.

#### PRUSSIA.

M. MOTARD (Zollverein, 262, p. 1063) was selected as the only exhibitor to represent Germany in stearic manufactures; and his articles fully justify the choice of the local authorities. M. Motard exhibits candles made by distillation as well as by lime saponification.

The wholesale price of stearic candles in Berlin is 1s. 0½d. per pound avoirdupois; of stearic acid, 10½d. per lb.; of candles made from the unpressed distilled acids of palm-oil (composite candles) 8d. per lb.; and of the unpressed acids, 7d. per lb.

In 1846 there were sixty-nine manufactories of soap, candles, and oils, giving employment to three hundred and fifty-five artisans; also five establishments for wax-bleaching and wax-candle making, employing thirty-two workmen.

#### RUSSIA.

There are Five Exhibitors of stearic candles in the Russian Department, whose productions are most creditable.

Russia possessed, in 1842, sixty-two candle-manufactories, which produced annually goods valued at 142,800l.; and two hundred and sixty-six tallow-melting establishments, which yielded tallow valued at 1,578,000l.

The price of stearic candles in Russia varies from 10d. to 10½d. per English pound.

#### SARDINIA.

There is One Exhibitor of stearic candles from Sardinia.

#### SPAIN.

In 1839, while the effects of the civil war which paralyed Spain for some years were still severely felt, M. JULIAN BERT (246, p. 1344), aided by M. de Milly, had the courage to establish a manufactory of stearic candles in Spain. The difficulties of inducing capitalists to join in forming a company being overcome, M. Bert had still to contend with formidable obstacles, from the discontinuance, at that time in Spain, of several collateral branches of industry. He was obliged to erect leaden chambers, and manufacture his sulphuric acid; also to establish a coopership and a boiler-making shop. In spite of these obstacles, his efforts were so successful, that, since that period, his Company have established still more extended works at Gijon, where saponification and

distillation are both practised; as well as soap-making on a very large scale. The distillation furnishes 3,500 lbs. of vegetable fatty acids per day. One hundred and fifteen workpeople are employed in the two establishments; they are all Spaniards, and were instructed at the works. There are two other manufactories of stearic candles, one at Barcelona, the other at Hernani. The wholesale prices of tallow and palm stearic candles are both 1s. 3d. per pound avoirdupois.

#### SWEDEN AND NORWAY.

Some of the finest stearic manufactures in the Exhibition are sent by J. JOHANSSON, of Stockholm (98, p. 1354). The beauty of these productions arises chiefly from the employment of newly-invented machinery, which this Exhibitor obtained from J. and C. G. Bolinder, engineers in the same town. Several candle-moulds are exhibited which are remarkable for their internal polish. They are made by simply dipping a cold highly-polished steel-rod into a melted alloy, chiefly composed of tin. In this way two workmen can produce from 100 to 110 moulds per hour. M. Johansson employs a steam-engine of twelve-horse power to work the hydraulic presses, slicing and mixing machines, and also a polishing machine, to which the great lustre of his candles is partly due.

#### TURKEY.

Moldavia contributed some very good specimens of stearic candles from its only manufactory, which possesses a steam-boiler and two hydraulic presses; and produces about twenty tons of candles per annum.

#### UNITED KINGDOM.

In 1832 a manufactory of stearic candles was established in London, with the co-operation of M. de Milly; and in 1833, M. Burjot introduced them into the market under the name of moulded wax.

In 1834, W. S. HALE (p. 796) commenced working, and has from this period gradually extended his works, until he has become one of the largest makers of stearic acid and candles in England by the lime process. His aim being the manufacture of a commercial article in large quantities, the productions which he contributes have not the whiteness and high degree of finish of those of some other Exhibitors.

It was likewise in 1834 that C. OGLEBY and Co. (p. 797) commenced working. They have since devoted themselves almost exclusively to the highest articles, and their stearic acid and candles are the whitest in the World's Show.

Soon afterwards J. C. and J. FIELD (p. 805\*) commenced the manufacture, and have likewise directed their attention successfully to the best class productions.

The manufactory of M. Burjot is no longer in existence, but has supplied the foremen employed in the first instance in the works of the three English exhibitors.

The wholesale price of stearic candles in England is 10d. per lb., and that of stearic acid 9d. per lb.

Besides those just named, PRICE'S CANDLE COMPANY (p. 801\*) exhibit interesting products obtained from the distillation of fats; and Mr. BAUWENS, the fat acids recovered from waste lyes.

The wholesale price of palm stearic candles is 9½d. per lb., and that of composite candles 5½d. per lb.

Imports of palm oil into the United Kingdom in 1850:—

|                      |       |         |
|----------------------|-------|---------|
|                      |       | Cwts.   |
| West Coast of Africa | - - - | 334,179 |
| Other Parts          | - - - | 13,617  |
| Total                | - - - | 447,796 |

In 1850, 4,672 lbs. of stearic candles were imported into the United Kingdom, and paid 24l. duty. This quantity is very insignificant compared with the annual consumption, and agrees in a great measure from the cheapness of production in England; another cause, however, is the preference shown by the British public for candles coloured yellow to resemble wax, which descrip-

tion is not manufactured in other countries. It is much to be regretted that this tendency to imitate one material by another should prevail to the extent it does, as it undoubtedly frequently retards the development of each in its own particular sphere. Many instances might be cited in illustration: the imitation of a carpet or marble pavement by oil-cloth, and hints and silk by paper-hangings, immediately occur; to which we may add, as more immediately connected with the subject under discussion, gas burners made to imitate oil lamps and candles, as if a tube conveying gas could not be arranged in an ornamental form. But to lower the beautiful white of the pure stearic candle by any contamination appears absurd, after bestowing so much skill in obtaining it free from colour. Our French neighbours, who, in matters of taste, are at least our equals, have long since discarded the less luminous wax candle, and invariably use those of pure white stearic acid for their grand fêtes. The Jurors lately witnessed a brilliant illustration of this fact in the gorgeous illumination of the Hotel de Ville at Paris.

#### WURTEMBERG.

Although the name of one manufacturer is given in the *Illustrated Catalogue*, no stearic candles are exhibited in the Wurtemberg department.

We now come to the consideration of candles made from wax and spermaceti. These substances, though differing from fats properly so called, present some analogy; they are even more closely allied than the fats themselves to the class of bodies called compound-ethers, inasmuch as they are actually combinations of certain fatty acids with the oxides of various alcohol-radicals; for, whilst oxide of glyceryl is common to all the fats and oils before spoken of, the waxes and spermaceti have their own peculiar bases, which, when liberated, are (unlike glycerin) insoluble in water; moreover, waxes are only partially acted upon by weak solutions of alkalies, and spermaceti not at all under ordinary circumstances; and although they may be split up into their proximate components by fusion with the solid hydrated alkalies, or ebullition with their very concentrated solutions, they must be considered as non-saponifiable in the ordinary acceptance of the term. The individual differences of wax and spermaceti will be farther elucidated as we proceed.

#### (c.) Wax-Candles.

Under the name of wax are included substances of various origin and of very different composition.\* The wax employed in the manufacture of candles is secreted by the honey bee, which has the power of producing this substance from its food (sugar). At one time it was thought that the bee collected the wax ready formed from plants, until Liebig advanced the contrary opinion, which was subsequently corroborated by the experiments of MM. Dumas and Milne Edwards.

A wax known as Chinese wax, and resembling spermaceti in appearance, was formerly supposed to be a vegetable wax; but the researches of Sir George Staunton and M. Stanislaus Julien, have demonstrated that it is the secretion of a male insect, the *Coccus ceriferus*, which deposits it on the trees on which it feeds, particularly the *Rhus succedanea*.† We owe to Mr. Brodie, a knowledge of the true chemical composition of wax.

\* The attention of the reader is directed to the following specimens of wax obtained from different sources, and which are but little known. Two examples (973 and 983) of bees'-wax from Tasmania, in the section of *Van Diemen's Land*; berry-wax and bees'-wax from *South Africa*; vegetable wax from *St. Domingo*; and in the *Chinese* section a so-called vegetable wax produced in Szechuen, and also white and yellow bees'-wax.

† For much valuable information respecting the so-called vegetable waxes of China, as well as the other products of that vast empire, the reader is referred to the *Etude Pratique du Commerce d'Exportation de la Chine*, by our colleague, M. Natalis Rondot. Paris, 1849. Guillaumin.

This chemist, by his recent elaborate researches, has shown that Chinese wax is a compound of a peculiar fatty acid (cerotic) and the oxide of an alcohol radical (cerotyl), and is consequently cerotate of oxide of cerotyl. Ordinary bees'-wax he finds generally to contain 22 per cent. of free cerotic acid, which is soluble in alcohol, and, with potassa, forms readily a soap. The residue, which is nearly insoluble in alcohol, and which has been usually called myricin, he has shown to be a compound of palmitic acid and the oxide of another alcohol radical (melissyl), that is, palmitate of oxide of melissyl. He has likewise been able to prepare from wax two new solid hydrocarbons (compounds of carbon and hydrogen), similar to paraffin.

Paraffin would be much too costly to be converted into candles if made from wax, as its preparation entails a considerable loss of material; it is, nevertheless, desirable that it should be obtained cheaply from some source, as it is much better adapted than any other substance for illuminating purposes, from its containing no element besides carbon and hydrogen, which are united in equal equivalents; it is, therefore, exactly of the same composition in a hundred parts as (defiant gas, which gives to ordinary coal and oil-gases their illuminating power. Examples of paraffin-candles are exhibited by MASSE and TRIMOUTIER in the French Section, which were made from paraffin obtained by distilling bituminous schist; but far more interesting specimens are sent by JAMES YOUNG, Class II., No. 7n, which seem to realize the great problem which the rare sagacity of Liebig\* pointed out as far back as ten years ago. "It would certainly be esteemed one of the greatest discoveries of the age," says he, "if any one could succeed in condensing coal-gas into a white, dry, solid, odourless substance, portable, and capable of being placed upon a candlestick or burned in a lamp." Now this very problem Mr. Young appears to have accomplished by distilling coal at a comparatively low temperature, whereby he obtains, instead of gas—the product of intense heat—a mixture of liquid and solid substances, the former capable of being burned in lamps like sperm-oil, or of being used for lubricating machinery, the latter yielding a beautiful mould-candle as solid and white as any prepared from paraffin from other sources. The Reporters have not, as yet, been able to obtain a fuller account of the economical bearings of Mr. Young's process,† which will most likely be considered in the Report upon another Class, but they confidently hope that this truly beautiful discovery will not meet with similar difficulties as the plan proposed some years ago for making paraffin-candles out of Irish peat. If coal-paraffin can actually be obtained in sufficient quantity and at moderate cost, we may witness another revolution in the processes of illumination; and the brilliant discoveries of Chevreul, but lately threatened by the splendour of the electric light, may be eclipsed by the general adoption of solidified coal-gas candles.

In most countries wax intended to be made into candles is previously bleached by a process presently to be described. That this, however, is not always the case, we find by specimens exhibited in the Egyptian and Tunisian Courts. The candles in the latter, which we may infer resemble those of the classical ancients, are true yellow wax "dips," and have a very ungainly appearance. The bees'-wax from which they are made is principally produced in the province of Kirwan; and the primitive method usually adopted for their manufacture consists in merely melting the wax in a copper vessel, and then dipping the wick repeatedly into it. Although such is the usual mode, the wax is sometimes bleached, and of course finer candles produced, but none such were exhibited. No animal fat is employed in Tunis for the manufacture of candles, although stearic candles of European manufacture are imported, and are in very general use.

Wax is more valuable when bleached, not only on account of the greater beauty, but also from the removal by this operation of impurities which would clog the wick during combustion. It may be bleached by chlorine, but the process is of no value, because its constituents retain a portion in combination, and hence hydrochloric acid is given off in burning.\*

The method of bleaching employed is very simple, although tedious; the following, with some trifling variations, is the plan adopted in most countries.

**Wax Bleaching.**—The wax is cut up into small pieces and placed in a vat, into which steam is made to pass through a perforated coil of pipes: a small quantity of very dilute sulphuric acid being added, in the proportion of one pint measure of strong sulphuric acid (oil of vitriol) to one ton of wax, and the whole well agitated for some time. This addition of sulphuric acid facilitates the separation of impurities which subside into the acidulated water.

As soon as, by subsidence, the wax has become bright, it is removed into a trough, with holes in the bottom about the size of an ordinary quill. The melted wax runs through these holes in small streams, on to a wooden cylinder, which is made to revolve, and the lower half of which is immersed in a cistern of cold water. The motion of the cylinder carries up a layer of water, on which the streams of wax fall, and form exceedingly thin ribbons, varying from half to one inch in breadth; these ribbons, by the revolution of the cylinder, dip under water, and as they rise upon the opposite surface, are removed, and spread out thinly and evenly on tables, placed in the open air, so as to be exposed to the action of the sun and air for a period varying from five to ten weeks. Once or twice, during that period, the wax is again subjected to the same process of melting; it requires also frequent turning, so as to present every portion to the bleaching agency of sunlight.

The fusing-point of wax is raised by bleaching, for yellow wax fuses between 62° and 63° C. (144° and 146° F.), and bleached wax between 64° and 65° C. (147° and 149° F.).

All waxes are not found to bleach with equal facility, according to the statement of Mr. Barclay. For example, English, Hamburg, Odessa, Portuguese, Mogadore, Zanzibar, East and West Indian, and North American waxes bleach very readily, whilst those from Cuba, Dantzic, Königsberg, Gambia, and Gabon are only bleached with difficulty, and seldom acquire a good colour.

Notwithstanding the difficulty with which Gambia wax is bleached, and its liability to become of a rusty brown, that country furnishes the greater part of the wax which is imported into Great Britain. Large quantities are likewise imported from Mogadore, the East Indies, particularly Ceylon and Singapore, and North America; the Mogadore wax is frequently largely adulterated with fat.

From Brazil a curious wax has been imported, the product of a black bee, which hives under ground. It is soft, and exceedingly tenacious, and of a dark mahogany colour. It does not appear in the slightest degree bleached after exposure to the sun. A considerable quantity might be imported, but no use has as yet been found for it.

The English wax is the most esteemed of all, but the small quantity produced is absorbed for various purposes without bleaching, on account of its fine quality and its brightness and fragrantcy.

In 1850 the quantity of bees'-wax imported for home consumption in Great Britain was 10,761 cwt., besides a small quantity of vegetable wax amounting to only 5 cwt. There is no duty on wax.

\* The attempt to bleach wax by means of chlorine, although unsuccessful in a practical point of view, has been very fertile in theoretical results. It is not generally known that one of the leading views in chemistry, the so-called theory of substitution, derived its origin from Gay-Lussac's observation, that wax, when exposed to the action of chlorine, absorbed this element into its composition, releasing an equivalent quantity of hydrogen in the form of hydrochloric acid.

\* Familiar Letters on Chemistry, 3rd edition; Letter XII., p. 158.

† According to a statement furnished to the Reporters, 100 parts of camel-coal, from Bathgate, yielded 40 parts of oil, and 10 parts of paraffin.

1,067 lbs. of wax candles were also imported and paid 9l. duty.

Wax is not well adapted for moulding on account of its tendency to adhere to the mould, and its great contraction in cooling; and though these difficulties may be overcome, yet it is found more advantageous to make wax-candles in the manner about to be described, as they are found to burn much better.

The first process consists in warming the wicks in a stove, and then suspending them to a hoop placed over a vessel of melted wax. The workman pours the melted wax with a ladle on to each wick in succession, and at the same time causes the wick to revolve on its axis by the motion of the fingers; when the candles are about one-third made, they are allowed to cool for a time, and the operation of pouring repeated until the candles are about half made, which is ascertained by the eye or by weighing. Whilst still warm, they are removed from the hooks and subjected to a process of rolling between two marble slabs, so as to render them uniform in thickness. The upper end of each candle is now formed by cutting down the wax to a metal tag which covered one end of the wick. The candles are then again suspended to the hoops, the end which had previously hung downwards being now upwards; and the operations of basting, and rolling repeated as often as necessary. Lastly, the lower ends of the candles are cut off to make them of equal length.

The wicks of wax-candles are always made of twisted unbleached Turkey cotton, the fibre of which appears better to resist the temperature of the highly heated wax during combustion. Plaited wicks are not adapted for wax-candles, as the plaiting, by diminishing the capillary action, entails the employment of so large a wick that it obscures the light; beside which, it is apt to curl round and round in the flame, and to collect a quantity of soot.

The large wax-candles, used in churches, are formed by laying the wick on to a slab of wax, which is then folded over on the wick, and the candle finished by rolling.

Long wax tapers are made by winding the wick on a drum, and then leading it under a guide-roller, placed in a trough of melted wax; from this it passes through a series of holes, progressively smaller, on to a second drum; the operation resembling somewhat that of wire-drawing. A little turpentine is added so as to render the wax pliable enough to wind.

Wax candles are coloured with the following materials:—

- Blue - - Artificial ultramarine.
- Green - - Mixture of verdigris and emerald green, or verdigris only.
- Yellow - - Chrome-yellow.
- Red - - Vermilion.
- Pink - - Madder-lake.

Wax mortar-lights, which are used as night-lights, have wicks of flax, as cotton is not found to be so well adapted to resist the long-continued action of the high temperature, and is not so uniform in its capillary action.

The larger mortar-lights have plaited wicks, and are used principally for warming dishes.

#### CHINA.

The Chinese employ bees'-wax, the insect-wax before spoken of, and also vegetable tallow (obtained from the *Billingtonia sebifera*, a tree of the order *Euphorbiaceæ*), in the manufacture of candles. The insect-wax is purified by filtration through moist rice, and is then, for the purpose of candle-making, mixed with one-hundredth part of oil. Bees'-wax is used either alone, or to form thin shells, into which the vegetable tallow is poured. This plan of encasing a soft with a hard material has been long in use in China, though only of recent introduction in Europe. The only contribution in the Chinese Department is from the Honourable EAST INDIA COMPANY (p. 322), who exhibit some examples of wax-tapers from Peking.

#### EGYPT.\*

From Egypt are contributed a few specimens of wax-candles, some of unbleached and others of bleached wax, which must be characterised as crude manufactures.

#### INDIA.

The Indian Department contains some well-made short candles of bleached wax, six and nine inches in length, which are manufactured at Patna. They are designated camphorated wax.

#### RUSSIA.

The most important contribution of that country is V. SAPELKIN'S (309, p. 1370), which consists chiefly of wax-lights, plain and ornamented, for the use of churches, though there are several for household use. Most of the other collections are small, and consist in some cases only of wax-twisted tapers. Two Exhibitors have sent fancy-baskets made of waxed wicks. In 1842 the wax produced in Russia was valued at 59,200l.

#### TUNIS.

This department contributes the most ungainly candles in the Exhibition.

#### TURKEY.

The Turkish Department contains specimens of very well-made and well-bleached wax-candles, and twisted tapers. The Jury have included these in their Award to His HIGHNESS the SUZAN, as in common with most of the articles exhibited, they were bought in the bazaars, and no individual Exhibitor's name was given.

#### UNITED KINGDOM.

The most remarkable collection of wax-candles, and specimens to illustrate wax-bleaching, is that of HARCLAY and SON, wax-bleachers (Class IV., 24, p. 196\*), who exhibit in the South-West Gallery. The manufactures are of the highest quality as regards the uniformity of the candle, and especially the very careful attention bestowed on the wick, the value of which was only to be ascertained by burning. The night-lights have the excellent quality of burning the indicated number of hours, which is a point of some importance.

#### f. Ornamented Candles.

The collection of ornamented wax-candles for weddings and fête days is in fair proportion. FRANCE, PORTUGAL,\* RUSSIA, and WURTEMBERG furnish specimens. Some decorated wax-candles for Catholic churches are also contributed by TUCKER and Co. to the Mediæval Court (Class XXVI., 536, p. 762).

The only three objects still to be noticed are candles made of two different descriptions of vegetable wax in its natural state. Those from St. DOMINGO (p. 1429) are of a greenish colour, and probably from the wax of the *Myrica cerifera*. The others, from NEW BRUNSWICK (23, p. 969), are dark green. Lastly, there are black candles made from bituminous shale of the Binney Quarry, Scotland, exhibited in the North Gallery (94, p. 795).

#### g. Spermaceti.

Spermaceti is a white crystalline body, fusing at 49° C. (120° F.) In its chemical relations it is closely allied to wax, and, according to the experiments of Mr. Laurence Smith, appears to be a compound ether, namely, cetylate of oxide of cetyl; cetyllic acid having the same per centage composition as palmitic acid, derived from palm-oil.

Spermaceti is obtained from the oil of the sperm whale, from which it readily crystallizes, especially in cold weather. The purification of sperm oil depends in a great measure on the complete separation of the spermaceti: hence, sperm oil "bagged" in winter, from yielding a larger quantity of spermaceti, is less liable afterwards to congeal than that bagged in summer.

DESCRIPTION OF THE PROCESS OF SPERMACE TI REFINING AT MESSRS. OGLESBY AND Co.'s WORKS, JAMNETH.

*Bagging.*—To separate the crystallized spermaceti, the sperm-oil is filtered through long cylinders of bagging.

\* There is a manufactory of stearic candles in Lisbon, but it has not contributed any of its productions.

lined with linen, these are at one end tied on to the nozzles of a feed-pipe communicating with a tank elevated about 6 feet, whilst the other end of the cylinder is tied up with a string. The oil being pressed upon by its own column, readily passes through the bags, which retain the spermaceti. This operation is called bagging, and is performed on a very large scale in the autumn and winter.

The spermaceti is of a dingy-brownish colour; and is readily removed from the bags, which are open at both ends; in this state it is called "bagged sperm."

*Pressing.*—The bagged sperm is then placed in hempen sacks, and subjected to a pressure of about 80 tons in an hydraulic press, which removes the greater portion of the adhering oil.

*Second Pressing.*—The pressed sperm is now melted, and crystallized by slow cooling, and after being ground to powder, is folded up in square pieces of bagging, and then subjected to the action of a much larger hydraulic press, capable of exerting a force of six hundred tons. The oil which runs from this press contains a small quantity of spermaceti, and is, therefore, returned to the bags to be filtered.

*Refining.*—The spermaceti is next melted in a large vessel, and boiled for some time with a solution of caustic soda, which readily saponifies the sperm-oil still adhering to the spermaceti, whilst it has scarcely any action on the spermaceti itself. By this means the sperm-oil is removed in the form of soap.

*Hot-pressing.*—The purified spermaceti is removed from the boiler, and run into flat tin-moulds to crystallize. It is then ground again to powder, and placed in linen bags, interleaved with horse-hair mats, and previously-heated iron plates, and pressed in a horizontal hydraulic hot-press, heated by steam.

*Second Refining.*—The hot-pressed spermaceti is then removed and boiled with a strong alkaline lye, the temperature reaching 113° C. (235° F.). By this final operation it becomes as colourless as water, and has only to be cast into blocks for the convenience of storing.

The wholesale price of spermaceti at present is 1s. 10d. per pound in England.

Spermaceti-candles are moulded in the usual manner, about 3 per cent. of wax being added to prevent crystallization. Spermaceti-candles are often coloured yellow with gamboge, and are then known by the name of transparent wax.

The wick of the spermaceti-candle is of plaited bleached cotton, and requires no previous preparation.

#### UNITED KINGDOM.

There are remarkably fine specimens of spermaceti and spermaceti-candles in the English Department, contributed by Four Exhibitors.

There are also specimens from the UNITED STATES and NEW SOUTH WALES, of a less important character.

It will be seen, from the subjoined account of Imports into the United Kingdom, that very little spermaceti is brought in as such, and that the major part is obtained by refining sperm-oil.

#### Imports during the Year 1850.

|                    |   |            | Duty. |
|--------------------|---|------------|-------|
| Sperm-Oil          | - | Tons 5,792 | Free. |
| Spermaceti         | - | lbs. 1,120 | " "   |
| Spermaceti-candles | " | " 728      | 20.   |

There are Sixty-four Exhibitors of candles of all nations: of these there are:—

- 1 Holder of a Council Medal.
- 20 Holders of a Prize Medal.
- 10 Who obtained Honourable Mention.
- 33 Unrewarded.

64

The number of Exhibitors from the various countries is as follows:—

|                           |   |   |   |   |   |    |
|---------------------------|---|---|---|---|---|----|
| America                   | - | - | - | - | - | 1  |
| Austria                   | - | - | - | - | - | 6  |

64

The Sixty-four Exhibitors of candles admit of classification according to the description of candles they chiefly exhibit, for only two have contributed in more than one of the classes into which they may be subdivided. Thus, there are Seven tallow-candle-makers, Twenty-one wax-candle-makers and wax-bleachers, Four spermaceti-refiners or spermaceti-candle-makers, and Thirty-two stearic acid and stearic-candle manufacturers. Nine of the latter exhibit soap, but only as a secondary product of their stearic manufacture; it has not, therefore, been taken into consideration under the head of soap and perfumery.

Before specifying the contributions of each Exhibitor who has received the award either of a Council Medal, Prize Medal, or Honourable Mention, a few words may be said to illustrate the point of view from which their merits have been judged. From our introductory remarks respecting the different varieties of candles, it is evident that tallow, stearic acid, composite, wax, and spermaceti candles cannot be judged by the same standard, as the various products serve different purposes, and on account of the difference in their cost can scarcely be said to compete one with the other. The physicist may determine their relative illuminating powers by experiment, and can, by comparing the price of similar quantities of different materials, ascertain the relative illuminating value of each variety. If carefully executed, such experiments may yield very positive results as to the purely economic question of the money cost of a given quantity of light, but are of no avail in estimating the advantages offered by the different articles in point of cleanliness, purity, or presentability: how, for example, can the relative purity of stearic acid, wax, or spermaceti be estimated? how can the blue white of stearic acid, the brightness of wax, the transparency of spermaceti, be measured by such means; and how the convenience of the self-smuffing candle?

In photometric experiments on the different illuminating powers of flames are to be of any value, they must be instituted with extreme care and accuracy. Hitherto the results obtained by different physicists have been marked by great discrepancies; this is to be explained by the difficulties which present themselves in the method of determination at present pursued. We need scarcely remark that we have not instituted experiments of this kind for the purpose of comparing the different varieties of candles exhibited. The amount of material submitted to the Jurors was so extensive, as to compel them to confine themselves to judging of the quality of the productions by their external appearance and the manner in which they burned. On account of the great difference in the fiscal relations of the countries contributing, and the great variation in the price of the raw material, it was not even possible to take into consideration the question of price which was given in some instances.

A little practice, however, soon enabled the Jurors to separate the different articles into the three classes of Excellent, Good, and Mediocre. The characters by

which these were fixed were—colour, density, and fusing-point of the candles, brilliancy and steadiness of the flame, continuous consumption of the wick, and less or greater tendency to gutter in a current of air.

#### LIST OF AWARDS.

**APOLLO STEARIN COMPANY**, Vienna (Austria, 39, p. 1009). Prize Medal, for an interesting display of stearic acid in blocks, and stearic candles; this is one of the largest, while, at the same time, it is one of the best in the Exhibition. The great excellence of these candles manufactured by the process of lime-saponification, their hardness and whiteness, are evidences of a thorough knowledge of this chemico-mechanical art, and of a minute attention to all the details of the various processes, without which no such articles could be produced.

**BARCLAY AND SON**, Regent Street, London (Class IV. 24, p. 196\*). Prize Medal. A very large collection, illustrative of the processes of wax-bleaching and wax-candle-making. Also wax night-lights, and wax moor-lights for warming fishes on the dinner-table.

The Medal is awarded to these Exhibitors, chiefly on account of the excellence of the above-named products; but as they exhibit likewise remarkably good stearic and spermaceti candles, these latter are included in the Award.

**BAUWENS, L. F.**, Grease-Works, Wakefield (Class IV., No. 26, p. 197\*). Prize Medal. The Award to this Exhibitor is for the recovery of fatty acids, applicable to soap-making and to the manufacture of candles, from the waste lyes and suds of the woollen, silk, and cotton manufactories. The quantity of soap used by the various branches of manufactures in favour of which the soap-duty is remitted, amounted in the year 1850 to 22,858,382 lbs., which may be estimated as containing on the average about 50 per cent. of fat, or 11,429,191 lbs., or in round numbers 5,000 tons. The importance, therefore, of economising this otherwise waste product will be fully appreciated if it be taken into consideration, that the manufacture of wool entails moreover the employment of a large quantity of oil, which is afterwards removed by washing. The quantity of oil employed for this purpose in Great Britain may be estimated at about 6,000 tons,\* contained in the suds in addition to the fat contained in the soap, making together about 11,000 tons. But supposing that from unavoidable sources of waste only 5,000 tons were annually recoverable, and estimating it to produce 157. per ton, the value would still amount to 75,000*l*.

**BEAR, J. J. and Co.**, Madrid and Gijon (Spain, 245 and 246, p. 1344). Prize Medal. The Jury award to M. Bert a Prize Medal for products of the highest class from the two manufactories he has established in Spain. From that of Madrid, in which saponification by lime only is practised, he sends beautiful stearic acid and stearic candles; from that of Gijon, in which he has lately erected a distilling apparatus to include the most recent improvements of England and France, he sends palmitic acid equal to any in the Exhibition; together with candles made of it. These latter candles are allowed by the Catholic clergy of Spain to be used in the churches.

**BRANDON, N. D.**, Amsterdam (Holland, 70, p. 1145). Prize Medal. The candles exhibited by Mr. Brandon are a proof that in Holland the stearic manufacture has reached its highest state of perfection; his candles are all that can be desired in hardness and careful moulding. The long stearic candles, which in Holland are allowed by the clergy to be used in churches, are very beautiful specimens of manufacture. The interest in the collection of this exhibitor is enhanced by the intermediate products which he has sent to illustrate the various stages of the process.

**BRENN, C.**, Dublin (90, p. 794). Honourable Mention.

\* In the year 1853, 278,022 bales of foreign wool, each containing on the average 256 lbs., were imported into London, Liverpool, Hull, and Leith, so that about 31,000 tons were imported in that year; and as about 20 lbs. of oil are consumed in "working" or scrubbing every 112 lbs. of wool, there must have been upwards of 5,500 tons used for the foreign wool only.

Mr. Brien exhibits very well-manufactured tallow mould-candles, which are white and hard.

**CAMPENHOUDT, CHARLES VAN, and Co.**, Heusden, Flanders (Belgium, 436, p. 1164). Prize Medal. The productions of these makers, whilst they are the finest in the Belgian division, may vie with most in the Exhibition for whiteness and hardness. Their candles named "*Bougies de l'Etoile*" are beautifully moulded, and have a high degree of polish.

**DELACRETAZ and FOURCADE**, Vaugirard, near Paris (France, 158, p. 1178). Honourable Mention. Messrs. Delacretaz and Co. are extensive contributors to the Exhibition, having sent some very large blocks of stearic acid, which is hard, but not of the highest degree of whiteness; the Jury, therefore, though they cannot award a Prize Medal to them, accord an Honourable Mention for their productions, which are very good, and which it appears they manufacture on a very extensive scale.

**DIXON, GEORGE**, Dublin (91, p. 795). Honourable Mention. The Jury make Honourable Mention of the clarified tallow mould-candles of great whiteness, hardness, and exterior polish, made of a mixture of purified tallow and stearic acid; also of the composite candles and the yellow soap exhibited by Mr. Dixon, which is likewise well manufactured.

**DONNEAUD and Co.**, Paris (France, 478, p. 1200). Honourable Mention. The Jury accord an Honourable Mention to Messrs. Donneaud and Co. for their stearic acid, and stearic candles, called "*Bougies du Phare*;" though not possessing that whiteness for which the stearic acid of many exhibitors is remarkable, still their products are very creditable, the candles being well moulded.

**DUMORTIER and Co.**, Lyons (France, 1593, p. 1253). Prize Medal, for most excellent white and hard stearic candles, well polished and carefully moulded.

**FIELD, J. C. and J.**, Wigmore Street (Class IV., 130, p. 205\*). Prize Medal, for the very fine blocks of white and hard stearic acids which they exhibit, and which evince a thorough knowledge of the stearic manufacture.

**FREEMAN, E.**, Wigmore Street (Class IV., 25, p. 197\*). Prize Medal, for very excellent spermaceti candles, called "transparent wax." The spermaceti candle (containing a small quantity of wax, to prevent crystallization) is in many cases preferred to wax, on account of its greater transparency, and brilliancy of flame. The peculiar tint of the wax is imitated in these candles by the addition of gamboge.

**HALE, W. S.**, Queen Street (99, p. 796). Honourable Mention. The productions which Mr. Hale exhibits, though very creditable, are not of the highest class, and seem more especially confined to the cheaper description of stearic candle, and those very economical, though not so presentable, sources of light, the so-called "Composite candles," which possess the property of being self-snuffing, and are much cheaper than the cheapest stearic candle, though, from their low fusing point, they are not so well adapted for use in hot climates.

**HOLMHLAD, L. P.**, Copenhagen (Denmark, 27, p. 1357). Honourable Mention, for a small collection of stearic candles, exhibited in connection with other articles by M. Holmblad. They are white and hard, but extremely high in price.

**JAILLON, MOINIER, and Co.**, La Villette, near Paris (France, 273, p. 1190). Prize Medal. The stearic acid manufactured by these exhibitors is made according to a recently patented plan, which consists in passing a rapid current of sulphurous acid into the lime-vat during the process of saponification, by which they state that they are able to produce a much greater quantity of solid fats than if they operated without the introduction of sulphurous acid;\* besides which, that they are enabled to use the commonest tallow, and produce white inodorous candles. The Jury could not enter into an experimental investigation of the merits of this new plan, and, there-

\* The chemist cannot help thinking of the conversion of the liquid oleic acid into the solid elaidic acid.

fore, wish it to be understood that the novelty or the supposed or real advantage of the process did not in the least influence the award of the Prize Medal, which is given solely on the merits of the products exhibited. The stearic acid and candles are, without doubt, amongst the best in the Exhibition, whilst they are the whitest in the French department made by the process of lime-saponification.

JOHANSSON, J., Stockholm (Sweden and Norway, 17, p. 1350). Prize Medal. The stearic acid contributed by this exhibitor is eminently pure, white, and hard, and is, with one single exception, the whitest in the Exhibition. It is most creditable to M. Johansson to have stood the test of comparison with so many veterans in the art, and to have come off with such high honours. The candles exhibited are most beautifully polished, more highly so than any others, and in other respects well moulded; the polish is due to a peculiar mould, which is exhibited, and which is produced by a peculiar method already described in the introductory notice (p. 624).

MANSE, TRIBOUILLET, and Co., Neuilly (France, 1346, p. 1240). Prize Medal. Messrs. Masse, Tribouillet, and Co. are amongst the largest exhibitors in this department, having contributed no less than thirty-five samples, illustrative of several very important branches of art connected with the manufacture of candles. Seven samples relate to that important industry in an economical point of view, the recovery of fats from waste suds and other refuse matter; as, for example, the parings of skin, and animal intestines. The candles manufactured from the distilled and pressed fats are very beautiful, hard, and white. There are seven also which show the progress of the manufacture of palmitic candles by the process of distillation, and include candles made with the unpressed fat acids, likewise very hard and white pressed palmitic acid candles, also candles made with a thin shell of hard palmitic acid, the centre being filled with the unpressed fatty acids.\* Three are the products of the recovery of fats from the waste suds of the wool-washers, and are similar to the first named. Four relate to the manufacture of candles from vegetable wax. There are also three specimens of the products of distillation from bituminous schist, including paraffin-candles and candles covered with lithographic transfers, which it appears are used in France, but they have a very common appearance. Besides these, there are specimens of oleic acid, olein, from pressed tallow, and oleic acid-soda soap. The Jury award the Prize Medal to Messrs. Masse and Tribouillet for their very beautiful candles, manufactured from various fatty acids produced by the process of distillation, and their extensive and interesting collection of products relating thereto.

MATISEN, A., and Co., St. Petersburg (Russia, 305, p. 1376). Prize Medal, for very beautiful stearic acid, of which MM. Matisen have sent seven blocks, and stearic candles, of excellent manufacture. These productions have a great degree of hardness, and are very carefully moulded.

MILLER, T. J., Dorset Wharf, Westminster (Class IV., 29, p. 197\*). Prize Medal. An interesting collection in the South-West Gallery, showing the progress of spermaceti-refining; also an enormous and, beautifully crystallized hollow block, or grotto of spermaceti, in the Western Nave. The Jury award the Prize Medal to this manufacturer on account of the very high degree of excellence to which he has brought the process of spermaceti-refining, as evinced by the absence of colour and impurity in the large mass he has exhibited; to produce which, no less a quantity than 3 tons, or 6,720 lbs., were fused at one time. After being allowed to remain at rest for a week, the spermaceti had cooled sufficiently round the circumference of the cask to be tapped, when about one half was run out; so that the shell which is exhibited, at 1s. 10d. per lb., is worth 308l.

MILLY, LOUIS ADOLPHE DE, Paris (France, 644, p. 1269). Council Medal. M. de Milly exhibits stearic candles, called by him "*Bougies de l'Étoile*," a name which, with that of Milly (stearin), is applied all over Europe to

similar products. He has sent, likewise, lime-soap, the mixture of fat acids resulting from the decomposition of this soap, pressed stearic acid, and oleic acid, so as to illustrate the various steps in the process; and besides these, oleic acid, potash or soda or hard soaps, made with the oleic acid. In consideration of M. de Milly being the first to solve the manufacturing problem of applying M. Chevreul's beautiful theoretical discoveries to the production of candles, the application of stearic acid for the preparation of candle-wicks, and the aid he has always rendered in establishing this chemical art in other countries, the Jury recommended M. de Milly to the Council of Chairmen as worthy of the Medal in their gift.

MILLY STEARIN-CANDLE COMPANY, Vienna (Austria, 40, p. 1009). Prize Medal, for a very splendid display of the stearic acid manufacture, both by the process of distillation and the older one of lime-saponification. This society have, in compliment to the Exhibition, sent three large and well-executed stearic acid Medallions; one of the Emperor of Austria, one of Her Majesty Queen Victoria, and one of Prince Albert. Their candles, made by the process of lime-saponification, are very hard, white, and well moulded, and their night-lights, or *veillidiers*, carefully manufactured. They have also exhibited the so-called "Composite" candles made with the unpressed products of the distillation of palm-oil.

MOTARD, A., Berlin (Prussia, 262, p. 1063). Prize Medal. Very excellent stearic candles manufactured by the process of lime-saponification, exhibited in connection with the stearo-margaric acid of which they are made; also, stearic candles made of the unpressed and pressed fatty acids derived from palm-oil, by the process of distillation. The stearic candles from the hot-pressed fatty acids of palm-oil are very beautiful: those made with the acids, as they run from the still, are an excellent and cheap substitute for the tallow candle. The collection is well arranged, and illustrates both processes very satisfactorily.

OOLEBY, CHARLES, and Co., Lambeth (139, p. 797). Prize Medal. The stearic candles contributed by this firm are the whitest in the Exhibition, and were used by the Jury as a standard of excellence, with which the productions of other exhibitors were compared. The so-called "Transparent wax" candles, made with a mixture of stearic acid and wax, are very beautiful, and burn with a remarkably dry cup. The spermaceti, in block, also exhibited, is of the greatest whiteness, and most beautifully crystallized. The spermaceti-candles, and those made of a mixture of spermaceti and wax, are exceedingly well manufactured. The Prize Medal is awarded by the Jury for the spermaceti and stearic manufactures, either of which would have entitled these exhibitors to the award.

PITANSIER, Odessa (Russia, 307, p. 1376). Prize Medal. The piece of hot-pressed stearic acid exhibited by M. Pitansier is prepared from mutton-tallow. It is extremely hard and sonorous, and beautifully white; the stearic candles are the whitest and best in the Russian Section, and occupy a first rank in the Exhibition.

POISAT (Unile) and Co. (France, 1399, p. 1243). Honourable Mention. The Jury make Honourable Mention of a few small pieces of stearic acid, exhibited with other articles by MM. Poisat and Co.; and which, from their diminutive size, had almost escaped observation. The stearic acid was very white and hard.

PRICE'S PATENT CANDLE COMPANY, Belmont Works, Vauxhall (Class IV., 83, p. 201\*). Prize Medal, for the invention of improved methods of distilling fatty bodies, illustrated by the following articles: very beautiful white and hard candles manufactured from the distilled and pressed stearic acid of palm-oil; candles equally hard and white, made from distilled animal fatty acids recovered from the refuse of the glue-maker, and which possess an additional interest in being obtained from a waste product; and candles made from the distilled vegetable tallow obtained from the *Stillingia sebifera*. Besides these, they exhibit the unpressed distilled fatty acids of palm-oil, in the state in which they are largely employed for the manufacture of the so-called composite candles, which appear to be destined to supersede the ordinary

\* See page 626, China.

tallow candle. (See the Prefatory Notice respecting the recommendation for the award of the Council Medal.)

QUANONNE, C. and J., Cureghem, Brabant (Belgium, 43<sup>e</sup>, p. 1335). Prize Medal. The manufactory of these exhibitors, which was the first established in Belgium, is one of the offshoots of that of De Milly, in Paris; hence they adopt the name for their candles which was given to stearic candles by their instructor, namely, "*Bougies de l'Etoile*." As regards colour and hardness, their stearic acid leaves nothing to desire; but their candles are not quite so carefully moulded as they might be, and have not that high degree of polish which is expected in carilles of first-class manufacture in other respects.

ROSSI and SCHIAPPARELLI, Turin (Sardinia, 6, p. 1302). Honourable Mention. Though the Jury did not find the stearic manufactures of these exhibitors quite equal to the best examples, they consider the stearic acid and candles to be carefully made, and therefore accord them an Honourable Mention.

SAINTE and Co., Cossypore (India, p. 922). Honourable Mention. The Jury have much satisfaction in making an Honourable Mention of the very good stearic candles manufactured in India by Messrs. Sainte and Co. The local manufacture of stearic candles deserves every encouragement, as they are peculiarly suitable to hot climates, on account of their high fusing-point, and as there must be a large quantity of fats of little value, which would answer well for their production.

SAPELKIN, V., Moscow (Russia, 309, p. 1376). Honourable Mention. The Jury accord to M. Sapelkin an Honourable Mention, in consideration of the great care bestowed on the manufacture of wax-candles for church-service; many of these are tastefully ornamented with a simple spiral of gold, and have a very elegant appearance. The equality in size of the candles, as compared with one another, and likewise of their diameter throughout their whole length, are points deserving commendation. It appears that in the Greek Catholic Churches only wax or vegetable oil is allowed to be burned.

### III. PROTEAN STONE, OR ARTIFICIAL IVORY.

Under this title there are exhibited, in Class XXIX., a number of articles, such as door-handles, finger-plates, inkstands, and letter-weights. These very beautiful objects are composed of a new material, derived from gypsum (native bi-hydrated sulphate of lime), which, by numerous variations in the method of treating it, is made to resemble ivory, granite, and various kinds of marble. From the specimens exhibited it appears to be very hard, and capable of taking the highest polish, which, it is said, is perpetuated by use. It is translucent and brilliant in colour, and, being tinted throughout the mass, the marbling and mottling are not liable to be rubbed off. It appears to be applicable to many purposes for which ivory and marble are at present used; but it is not fitted to be made into knife-handles, on account of its brittleness.

In order to illustrate this very ingenious manufacture, we must recal to the recollection of the reader the very familiar phenomenon of the solidification of a mixture of plaster-of-Paris (de-hydrated sulphate of lime) and water, which arises from the circumstance that the anhydrous sulphate of lime recombines with water equivalent in quantity to that of which gypsum is deprived by heat in the formation of plaster: but, as under the conditions of this solidification the plaster is diluted with far more water than it can recombine with, it results that a portion must be left in a free state in the interstices of the mass, which is consequently opaque, and, on drying, becomes porous; and although it is the same in chemical composition, it differs greatly in its physical aspect and properties from the native compound gypsum or alabaster, which is crystalline and translucent.

In reflecting on the cause of this difference, it occurred to Mr. Cheverton that if the combination of water and anhydrous sulphate of lime could be slowly effected, whilst the latter was in a state of compression, an artificial stone might be produced, compact and crystalline in texture, and translucent in appearance. This view was fully confirmed by a series of experiments.

The process by which these results are obtained is described in the specification of Mr. Cheverton's patent, obtained in June 1850, as consisting in the de-hydration and subsequent re-hydration of native bi-hydrated sulphate of lime, either in a compact form, as alabaster, or in the state of a fine powder. In the first instance the alabaster is wrought into the required form; and in the second, the material, in the state of a very fine powder, is compressed into a mould of the proper shape.

In either case, after the object has been fashioned, it is exposed for 48 hours to a temperature of from 121° to 177° C. (250° to 350° F.), by which means the water originally combined with the sulphate of lime is driven off. The substance thus becomes very friable, but still retains the form into which it has been wrought. Sometimes plaster-of-Paris itself is compressed into moulds, but the article so formed is still subjected to the operation just described, notwithstanding the previous baking of the gypsum.

If a translucent appearance is required to be given to the surface of the figure, it is, before re-hydration, immersed into "white hard varnish," olive-oil, or other "oleaginous matter," until the surface is saturated; but if an opaque surface is desired, then this operation is omitted.

To effect the hardening, the object is plunged for an instant only into water heated to a temperature of from 38° to 65° C. (100° to 150° F.). This operation is repeated at intervals of from 10 to 15 minutes, until the sulphate of lime is completely saturated. The mass then becomes crystalline and much harder than alabaster; a circumstance which induces a belief that the new substance contains a quantity of water in combination different from that in the native body: or, in other words, that it is a new hydrate of sulphate of lime. The success of this part of the process depends in a great measure on the very gradual manner in which the combination with water is managed; for without due care the material decrepitates, and the article is then destroyed.

The colouring is effected by dissolving the requisite colours in water, and either sprinkling the object here and there with the coloured solution, so as to produce a mottled appearance, or else by immersing it altogether in the dye, which produces an uniform stain. This operation is performed previous to that of dipping in oil or varnish.

To the only exhibitors of this branch of manufacture, D. STRAIGHT and SONS (252, p. 802), a Prize Medal is awarded.

### IV. BLACKING.

Although the compound which we now call blacking (French, *Cirage*) is, in all probability, of very recent invention, nevertheless it appears to have been customary to imbue shoes with an oily mixture before the time of Pliny, since it is stated by him that Cato recommended the dregs of the olive (after the expression of the oil) to be used for anointing bridle-reins, leather-thongs, and shoes, in order to render them supple.\* It must, however, be remarked, that a mixture somewhat similar to modern blacking is also described by the same author,† and it appears quite natural to infer the occasional use of it for renovating the black colour which we are also informed was given by shoemakers to leather, by means of vitriol;‡ two kinds of substances of this name being known, namely, blue-vitriol (sulphate of copper) and green-vitriol (copperas, or sulphate of iron).

The mixture alluded to was chiefly used for ink, whence it was commonly called *atramentum*. It was composed of lamp-black, gum, and vinegar, and would, therefore, only have required the addition of oil and honey to make it into a tolerable blacking. This inference is rendered the more probable from the discovery of the remains of leather found in the Roman gravel-pit discovered in digging the foundation for the New Royal Exchange, which appears to have been covered with a sort of black-

\* *Nat. Hist.*, Book xv. chap. viii.

† *Ibid.*, Book xxxv., chap. i.

‡ *Ibid.*, Book xxxiv., chap. xii.

ing. They are thus described by Mr. Tite, the architect.\* "The fragments, in general, are of black leather, similar to that of the other articles; but there are some pieces which may possibly have been once of another colour. It is most probable that the upper surface was almost always shining, and several instances may be noticed where it still retains a dull gloss, which appears usually to have protected that particular side."

The French word "*Cirage*," however, renders it extremely probable that modern blacking was originally composed chiefly of wax and tallow, and probably lamp-black; and somewhat similar, therefore, to harness-blackening. That ordinary liquid-blackening was first imported into France from England, is probable, from the circumstance that blacking was termed *Cirage Anglais*, at all events to the year 1830, and it may still be known by that name.

When or how the English mixture now employed was first discovered, the Reporters cannot pretend to decide; but, according to the statement of Mr. William C. Day (nephew of Mr. Charles Day), the recipe for its preparation was communicated to Mr. Richard Martin whilst he was travelling on the Continent. Mr. Martin afterwards became associated with the late Mr. Charles Day; and in 1801 they commenced the manufacture of blacking. Mr. Martin having retired in 1808, the business was still carried on under the names of Day and Martin, by Mr. Day, until his death, in 1836, by which period he had acquired a colossal fortune.

To give some idea of the extent of the operations still carried on at "Day and Martin's," it may be stated, that on the average 150 casks, containing a quantity of blacking equal to 900 dozen pint bottles, are sent out per day. The price of the stoneware bottles, for containing the blacking, varies with their size, the usual sizes costing *vis. 9d.* and *12s.* per gross; and the corks (bungs) costing *1s. 4d.* per gross. There is also a large outlay required for labels and sealing-wax.

Besides the establishment of Messrs. Day and Martin, there are, in London, two other very important blacking-manufactories. One of these was founded by Mr. Robert Warren, who commenced about the same time as the firm already noticed, and retired some years back; but the business is still carried on by his successors; and the other was founded, at a subsequent period, by Mr. Everett, who commenced business in King's Head Court, Holborn, and afterwards transferred his manufactory to Fetter Lane, where it still exists; Mr. Everett died in 1840, not, however, before he had realised a considerable fortune. Only the last-named of these large blacking-works contributes to the Exhibition, and unfortunately its manufactures were not brought under the notice of the Jury.

Blacking, it may be remarked, consists essentially of two principal components, namely, a black colouring-matter and certain substances which will acquire a gloss by friction. Each maker has, of course, proportions and methods of mixing peculiar to himself, but the chief materials used are the same in most cases. In England† they generally consist of:—Bone-black, sugar or molasses, sperm-oil, sulphuric acid (oil of vitriol), and strong vinegar. These, according to Mr. W. C. Day, are mixed in the following order:—The bone-black, in the state of a very fine powder, and the sperm-oil are first thoroughly incorporated; the sugar or molasses, mixed with a small proportion of vinegar, is now added and well stirred with the mass; strong sulphuric acid (oil of vitriol) is then gradually poured into the vessel. Much heat is generated at this stage of the process, and an effervescence ensues, owing to the action of the acid on the carbonate of lime

contained in the bone-black. The object of the sulphuric acid (which should not be in excess) is to cause the decomposition of the tri-basic phosphate (and the carbonate) of lime, contained in the bone-black, so as to produce on the one hand sulphate of lime, and on the other a soluble acid phosphate. Sulphate of lime, when produced under such circumstances, gives rise to a very tenacious paste, by mixing with the finely divided carbonaceous matter of bone-black disintegrated by the same reaction; which paste (or lake) is capable, when spread out, of assuming a very smooth surface. To this the sugar and the oil impart the property, not only of adhering to the leather, but also of taking a high degree of lustre under the frictional (or burnishing) action of the brush; the oil is moreover very useful in rendering the leather pliable.

The mixture, after the action of the acid has ceased, is diluted with an additional quantity of vinegar, and is bottled whilst it is still warm. By bottling the liquid in this state, and corking and sealing it immediately, a rarefied space is formed; and there is no stability afterwards that the blacking (if it wet the cork) will exude by the expansion of the air contained in the bottle, as it is not likely to become again heated to the same temperature under the influence of any climate to which it may be subjected. The vinegar employed should not be too weak, otherwise the blacking will not keep.

Paste-blackening is now made in precisely the same way as Liquid-blackening, excepting that the last portion of vinegar is not added. The employment of such blacking appears to have preceded that of liquid-blackening. It was usually stuck on to a small shovel-shaped board, having a very short handle; and it was wetted with water (or saliva) as required. The old Cake-blackening differed in composition from that of the present day, and appears to have contained lamp-black, treacle, and oil.

#### AMERICA.

Two exhibitors send both Liquid and Paste-Blackening, the former being contained in glass bottles and not stoneware as in England. The blacking was found to be nearly of the same quality from both; but not so good as that commonly used in England. The contributors are—E. STEENE (290, p. 1453), W. R. BAKER (301, p. 1462). T. TURNER (425, p. 1463) sends Edge-blackening for shoemakers.

#### BRITISH COLONIES.

C. WARD (Van Diemen's Land, 186, p. 995) contributes a specimen of Blacking, but it calls for no especial notice.

#### FRANCE.

In 1847 there were, in Paris, One hundred and thirty-seven manufacturers of blacking and varnish for shoes, who employed 140 workpeople, and produced goods to the value of 38,800*l.*; France is, however, represented by only one exhibitor in this trade, M. HÉBERT (869, p. 1221), who sends a specimen of varnish for boots and slippers, which was not submitted to the Jury of Class XXIX.

#### PRUSSIA.

The only contribution is from C. TEICHMANN (p. 1088); it consists of Paste-blackening, which, though of fair quality, is not equal to the English blackening.

#### SARDINIA.

B. BOURGON (75, p. 1305) exhibits specimens of Paste-blackening for shoes, and paste Harness-blackening, which call for no particular comment.

#### UNITED KINGDOM.

The contributions of Two Exhibitors only were brought under the notice of the Jury of Class XXIX., namely, 272 and 281*o* (p. 876); of these the best is that of S. B. ALCOCK and Co., of Dublin (272, p. 816), whose productions are here favourably noticed, although no Award was made. The wholesale prices of their usual size bottles of liquid-blackening are 3*s.* 6*d.* and 9*s.* per dozen.

\* *Antiquities of the Royal Exchange*, 1848, p. 56.

† According to the information which Baron Liebig has kindly furnished to the Reporters, it appears that, in Germany, blacking is made in the following manner: powdered bone-black is mixed with half its weight of molasses, and one-eighth of its weight of olive-oil; to which are afterwards added one-eighth of its weight of hydrochloric acid (muriatic acid), and one-fourth of its weight of strong sulphuric acid. The whole is then mixed up with water to a sort of unctuous paste.

The manufactures of the other exhibitors who contribute to Classes:—II., 22, p. 190; IV., 70, p. 200\*; XVI., 39 and 322, pp. 519, 534; were not observed by the Reporters until the duties of the Jury were completed.

The number of Exhibitors from all parts is Thirteen. There were no Awards.

The classification according to the various countries is as follows:—

|                                     |   |   |   |    |

## V. CHEMICAL MATCHES.

The manufacturers of chemical matches are placed in an anomalous position with regard to the other contributors in the Great Exhibition, inasmuch as that they were not permitted to send their *actual produce*, on account of the precautions deemed advisable to be taken for the security of the Exhibition Building against fire. Hence they were compelled to rest satisfied with contributing unflammable imitations of their articles; and under such circumstances it is evident that it was quite impossible for the Jury to make any equitable Awards in this branch of industry. This result is the more to be regretted as the manufacture of chemical matches, although comparatively a very recent art, has been of late years developed in a most remarkable manner; and notwithstanding the high degree of perfection to which it has already attained, it is still undergoing further improvements consequent on the rapid progress of chemical science. Had it been possible to have foreseen and provided against all contingencies, an out-building might have been constructed for the reception of these goods, which would have afforded a secure as well as a most valuable opportunity of comparing the relative merits of the matches prepared in various countries.

In another part of this Report will be found some descriptive notices of several conveniences for travellers and others contained in the hollow heads of walking-sticks. One of these consisted of an apparatus for procuring instantaneous light, and the contrivance appears almost to realize the fable of Prometheus, who concealed the fire which he stole from Jupiter in his *narthex*, ferula, or stem of fennel, on which he leaned in travelling.

"I am he who sought the source of fire,  
Enclosing it hid in my *narthex*-staff;  
And it hath shown itself a friend to man,  
And teacher of all Arts."\*

This invention, however, was in reality only the means of preserving fire unextinguished, somewhat like the German tinder of the present time, and not of causing instantaneous ignition. The giant fennel, of which the ordinary ancient walking-sticks were made, sheds its seeds about September, when the stem decays, and becomes a substance so easily ignited as to be employed in Sicily for tinder. The pith of the plant also is stated by Proclus to be an excellent preserver of flame, to which Pliny adds his testimony, that it makes excellent matches, the Egyptian sort being the best.†

There is, however, another form in which a staff may be metaphorically said to conceal fire, since one of the most primitive means of producing it was by the friction of two pieces of wood against each other until sparks were emitted, and flame was then easily communicated to dry leaves or decayed vegetable matter. This method of procuring fire has been found generally in use in several savage nations, though with some difference in the process; and St. Pierre describes one of the most common, as practised by the West Indian negroes:—"With the sharp edge of a stone," says his narrative, "Paul made a small

hole in the branch of a tree that was sufficiently dry, which he fixed firmly between his feet, and he then employed the stone to shape into a point another piece of wood, equally dry, but of a kind different from the former. He next placed the pointed wood in the hole which he had provided, and made it to turn rapidly between his hands like a chocolate-mill, and in a few moments he saw smoke and sparks issuing from the place of contact, and then collecting dry plants and sticks, he lighted a fire at the foot of the palm tree."‡

It appears that the same process was in ordinary use with the Romans down to a late period, even when the flint and steel were well known. "This experience," says Pliny, "was first discovered in camps and by shepherds, when a fire was wanted and a fitting stone was not at hand; for they rubbed together wood upon wood, by which attrition sparks were engendered, and then collecting any dry matter of leaves or fungi, they easily took fire. For this purpose nothing is better than to rub the wood of the ivy with that of the laurel, and a wild vine, different from the *labrusca*, which grows upon trees in the manner of ivy, has been also proved to be good."§ The same authority, in enumerating the different kinds of wood fit for kindling a light, denominates them *igniaria*, or those trees out of which fire may be produced. *Pyridicula igniaria* appears to have been the usual name of a Roman tinder-box, but Solinus calls the fire-box *ignitabulum*, and assigns its invention to Pyropolis, in the island of Delos.¶ In those receptacles the apparatus probably consisted as well of a small iron bar and a fragment of flint or pyrites, as of pieces of those woods which were the most readily ignited. Virgil notices "the hidden fire in the veins of flints," § as being one of the benefits anciently bestowed on man at the commencement of the reign of Jupiter; and pyrites are described by Pliny as being well known and esteemed for producing sparks. "Certain of them," he says, "have much fire in them, whence we call them *living*, and they are very heavy. They are sought for because they are most valuable in camps; for when they are struck hard with an iron spike (*clavus*), or another stone, they will emit sparks, which being taken by sulphur or dry fungus or leaves, will cause them to catch fire even with the rapidity of speech."||

There does not appear to be any information extant relating to the material anciently employed for tinder, unless it may be presumed to be indicated in that passage of the Prophet Isaiah (chap. i., v. 31) which declares that "the strong shall be as tow and the maker of it a spark, and they shall both burn together, and none shall quench them." It is probable that a very small degree of experience would suggest the thought that flax or the linen wicks used for lamps would easily receive sparks and become ignited, but of this there has not been any certain information preserved.

For many centuries the apparatus of a stone struck against a piece of iron continued, with but little improvement, to be the only means of procuring light. By the Saxons the flint or the pyrites was used under the general name of *syr-stan*; and any piece of iron that was sufficiently substantial was the substitute for the modern steel. A writing-stylus is known to have been used for the purpose by the Abbot Bertin in Burgundy, early in the seventh century; an instrument, however, which should be at once more substantial and more convenient for striking, must have been soon required, and was probably as speedily invented in the form of the *fusil*, a thick rhomboidal piece of steel, having the faces cut into many angles. This was in use at a very early period of the Middle Ages, when it is frequently to be found mentioned under a variety of names, all of them being derived from the same original. In 1429 Philip the Good, Duke of Burgundy, established the Order of the Golden Fleece, in the collar of which the flint and steel of the time formed the principal device. The latter was

therein represented as a short and stout fusil, sharpened to a pointed edge on one side, and on the other having two small curved handles, with a vacant space between them for the hand; and a modification of this shape for the steel continued to exist to the close of the history of the old-fashioned tinder-box.\*

It was not until after the middle of the seventeenth century that the discovery of phosphorus indicated a quicker or more certain means of procuring light or fire. In 1677, Dr. Hook, in one of his Cutler Lectures, described the effects of phosphorus, as they had been recently exhibited in England to the Hon. Robert Boyle and several other Fellows of the Royal Society, by Daniel Kraft, "a famous German chemist." Even after all the earliest experiments, however, the new matter appeared to be regarded only as a curiosity, which Boyle entitled the "*Noctiluca*," and "a factitious self-shining substance," procured but in very small quantities, and with great labour and time; the principal value of which was to supply a light in the night or in dark places, when exhibited in glass vessels. It can scarcely be doubted but that some trial was made as to whether an ordinary match could be inflamed by the substance, but Boyle's recorded experiments refer only to the strength, the diffusion, and the continuance of the light.

After these notices of the older apparatus devised for procuring light, it will be an interesting inquiry briefly to glance at the history of chemical matches. And here it may be first remarked that the transition from the tinder-box, with its flint and steel, to the elegant friction-match, was not so simple as a superficial consideration of the subject might lead one to infer. In the daily enjoyment of a luxury, we but too often forget the persevering efforts which are always necessary to render available the discoveries of the experimental philosopher, and take but little heed of him whose disinterested labours are constantly bringing to light new truths from the hidden but inexhaustible stores of nature.

The perfecting of chemical matches has been accomplished chiefly during the last thirty years, for before 1820 scarcely any other method of producing fire was employed than that of the well-known trio before alluded to, with which the ordinary sulphur match was inseparably associated.

Soon after this period Doebereiner made the remarkable discovery that finely-divided platinum (*spongy platinum*) is capable of inflaming a mixture of hydrogen gas and atmospheric air, and he founded on this property of platinum the invention of the Instantaneous Light Apparatus, first known by the name of Doebereiner's Hydrogen-Lamp. This was greatly admired at that time, and is even now frequently employed, it having been again recently applied to light an ordinary gas burner required to be ignited at intervals during the day-time for the purpose of sealing parcels and other similar objects. Although it was without any immediate influence on the development of the manufacture of chemical matches, which had before this time been repeatedly attempted, Doebereiner's discovery appears, nevertheless, to have attracted attention more generally to the subject, and thus, at least, to have contributed indirectly to their perfection.

A method of producing ignition, proposed about the same period, has never been generally adopted. It depends upon the property which certain compounds of phosphorus and sulphur possess of inflaming when slightly rubbed, in contact with the atmosphere. For this purpose about equal quantities of phosphorus and sulphur are fused together in a glass tube, which is to be subsequently closed with a cork.† Upon opening the tube, if a splinter of wood be dipped into the mass, so that a small quantity of the composition may adhere to the wood, it will become ignited when slightly rubbed

on the cork used to close the phial. This apparatus, however, has become almost entirely obsolete.

The first important and permanent improvement in the means of obtaining light consisted in covering the sulphurized end of a match with a mixture of sugar and chlorate of potash; which being deflagrated by immersion into concentrated sulphuric acid, communicated the inflammation to the underlying coating of sulphur. Many persons will call to mind the small glass phials containing asbestos moistened with concentrated sulphuric acid, which was usually fixed in a paper or tin box having two compartments, one of which held the prepared matches. These matches were in all probability invented in France, whence at least they were certainly first introduced into England; but prior to their introduction Captain Manby had been accustomed to employ a similar mixture for firing a small piece of ordnance for the purpose of conveying a rope to a stranded vessel; and indeed the composition was also described by Parkes in his "*Chemical Catechism*"\* amongst the experiments illustrative of combustion and detonation at the close of the volume.

Exactly the same principle was involved in the preparation of the matches invented by Mr. Jones, of the Strand, and used for some time in England under the name of "Prometheans," but which do not appear to have found their way to the Continent. These were made of a roll of paper, into one end of which was placed a small quantity of a mixture of sugar and chlorate of potash, with a small tube (hermetically sealed), similar to those in which the leads of ever-pointed pencils are preserved, containing a minute quantity of strong sulphuric acid. By compressing the match with a pair of pliers, sold for the purpose, or between two hard substances (between the teeth, for example), the tube was crushed, and the sulphuric acid came into contact with the mixture, and ignited it. These matches, though very convenient, were so expensive that they were not very generally employed; but they certainly formed, as it were, the stepping-stone to the production of the friction-match.

The first true friction-matches, or *congreves*, made their appearance about the year 1832. They had a coating of a mixture of two parts of sulphide of antimony and one part of chlorate of potash, made into a paste with gum-water, over their sulphurized ends, and were ignited by drawing them rapidly between the two surfaces of a piece of folded sand-paper, which was compressed by the finger and thumb.

The Reporters have not succeeded in learning with certainty by whom the substitution of phosphorus for the sulphide of antimony was first suggested; the mixture of the sulphide with chlorate of potash required so much pressure to produce the ignition that it was frequently pulled off from the match, and this substitution was therefore an important improvement.† The phosphorus matches or lucifers appear indeed to have been introduced contemporaneously in different countries about the year 1834. In Germany they were first manufactured on a large scale in the Grand Duchy of Hesse, and especially in Darmstadt, where Dr. Moldenhauer, in particular, contributed much to the improvement of this branch of industry.

• From Darmstadt the manufacture was gradually extended throughout Germany; but its progress was at first very slow, on account of the lucifer-match being prohibited, until the year 1840, in Bavaria, Brunswick, Hanover, and various other states, on account of the alleged increased risk of fire consequent upon its employment. At present, however, there are manufactories established in Vienna, Prague, Triesch, Schiffteuhofen, and Goldenkrön, Berlin, Nuremberg, Ludwigsburg, Ulm, Gmünd, Warnemünde, and numerous other places.

According to Dr. Moldenhauer and Professor Schrötter

\* Du Fresnoy, *Glossarium*, 1736, vi. col. 562, voce *Sci.* 3.

† To those who would repeat this experiment, we would remark, that the fusion should be performed with great caution, inasmuch as the mixture frequently detonates at the moment when the components enter into chemical combination.

\* Third Edition, 1808, p. 563.

† Detonating mixtures of chlorate of potash with either sulphide of antimony or phosphorus, are described in Parkes's *Chemical Catechism*, 10th Edit., published in 1822; and the latter in the 3rd Edition (1808).

(to whom the Reporters take this opportunity of expressing their thanks for most of the statistical and other information respecting the progress of the art in Germany), there are in the province of Starkenburg, Grand Duchy of Hesse Darmstadt, no less than eight manufactories, producing weekly about 500,000 boxes of matches, which are valued at 3000 florins (257*l.*), yet the Grand Duchy is unrepresented in the Great Exhibition as to the production of (artificial) chemical matches.

In Austria, the manufacture of chemical matches has been of late developed to so great an extent, that it supplies not only what is required for home consumption, but also enough to form an important article of exportation; indeed it appears that the most important item of Austrian commerce with Chili consists of matches.

The matches manufactured in Austria amounted in 1849 to 50,000 cwt., of which four-fifths were consumed in the country, and one-fifth was exported. From Trieste 3,787 cwt. were shipped, viz., to

|                     | Cwts. |
|---------------------|-------|
| Turkey - - - -      | 1,226 |
| Greece - - - -      | 586   |
| Malta - - - -       | 432   |
| Egypt - - - -       | 332   |
| Ionian Islands - -  | 336   |
| Naples - - - -      | 225   |
| Other Countries - - | 530   |
| Total - - - -       | 3,787 |

That the export trade of Austria in matches is rapidly increasing, appears from the following statement of the quantities shipped on the Elbe during the last three years:—

| Quantities shipped on the Elbe in | Cwts. |
|-----------------------------------|-------|
| 1848                              | 286   |
| 1849                              | 790   |
| 1850                              | 1,860 |

As matches are not always specified in the Official Report on Commerce, it is not possible to give a detailed statement of all the quantities exported.

It is estimated that of the total production of matches in Austria, one-third is manufactured in Bohemia, and two-thirds in the districts of Vienna and its vicinity. The number of factories in Bohemia is ten; of these there are two in Prague, one of which exhibits; one at Schüttenhofen, which also exhibits; one at Búdweis, one at Teplitz, one at Taus, one at Tschernoschin, one at Schönthal, one at Nahoschitz, and one at Hohenelbe. These establishments give employment to about 1,000 workpeople.

In Austria Proper there are twenty-two factories, namely, sixteen at Vienna, two of which exhibit, three at Fünfhaus, one at Schärding, one at Tulle, and one at Pottenstein; there is also one in Mofavia, which likewise exhibits. The number of workpeople employed is about 2,000.

In illustration of the quantities of the different materials employed, it may be stated that a Bohemian manufactory employing 100 workpeople produces annually about 200,000 boxes, each containing 5,000 matches. It consumes annually 25 cwt. of nitre, 6½ cwt. of phosphorus, and 300 cwt. of sulphur. Calculating on these data the total amount of materials consumed in all Austria, the following numbers are obtained:—

|                  | Cwts.  |
|------------------|--------|
| Nitre - - - -    | 1,250  |
| Phosphorus - - - | 325    |
| Sulphur - - - -  | 15,000 |

The quantity of soft wood consumed annually amounts to 5,000 *klafters* or fathoms; and it is worthy of notice that a large portion of it is manufactured into splints in Búdweis, and thence sent to Vienna. About 50,000 millions of single matches are produced annually in Austria. These are made with astonishing rapidity, in consequence of the employment of a simple plane of peculiar construction; with this instrument a single workman cuts off 1,814,000 splint in a day of twelve hours.

From other parts of Germany there are Four Exhibitors; namely, one from Prussia, two from Wurtemberg, and one from Mecklenburg-Schwerin; the Reporters, however, have not been able to ascertain how far they represent the manufacture in all those places; but they are enabled to state that there were twenty-one manufactories, employing five hundred and sixty-one workpeople, in Prussia in 1846.

According to a statement of M. Payen, the quantity of phosphorus consumed in France for lucifer-matches amounts to 30,000 kilogs. (590 cwt.), whilst 100 kilogs. (2 cwt.) suffice for all the other purposes for which it is used. In 1850 220 kilogs. (4½ cwt.) were exported to England. From these numbers, it would appear that the quantity of lucifers manufactured in France must exceed that of Austria in the ratio of 590 to 325, or as 18 to 10. Yet France is unrepresented in this art, the only contributor exhibiting sliding-boxes to contain the matches.

The Reporters have not been able to collect any information respecting the extent of this manufacture in the United Kingdom. In 1850 there were 50,000 gross of matches imported into the port of Hull; but the Reporters are unable to state the total number imported into the United Kingdom, as chemical matches are entered in the Customs returns under the general head of "Goods non-enumerated."

Formerly large quantities of phosphorus were imported into the United Kingdom for the purpose of chemical-match making; but it will be seen by the following table, that this substance must now be made within the British dominions in sufficient quantity to supply the entire demand.

VALUE OF THE IMPORTS OF PHOSPHORUS INTO THE UNITED KINGDOM.

| From 9th July. | From Denmark. | From the Hanseatic Towns. | From Holland. | From France. | From all Parts. |
|----------------|---------------|---------------------------|---------------|--------------|-----------------|

| 1849           | —             | 29                        | 60            | 33           | 122             |
| 1850           | —             | 2                         | —             | 1            | 3               |

Although lucifer-matches are made to some extent in the United States, there is no exhibitor of them in the American Section.

In continuing the narrative of the progress of this manufacture, we may next observe that, as it extended, all the processes were much simplified and, as a consequence, the prices of the articles produced were lowered. Nor was this the only improvement, for a whole series of inflammable compounds was successively tried; and at last, by substituting, entirely or partially, saltpetre for chlorate of potash, the detonation attendant on the earlier matches was avoided. It was also found that the sulphur-coating of the match could be to a great extent, or even entirely, dispensed with, and the cause of the unpleasant odour previously accompanying ignition in a great measure removed. Besides the ordinary match of wood, numerous other materials were devised, which could not have been made with the original composition of sulphide of antimony and chlorate of potash; as, for instance, wax-taper matches, fuses of Amadou (German tinder) and brown paper, Vesuvians for insertion into a cigar, &c. The roughly formed wood-matches, also, which had been previously cut by hand, were superseded by others carefully rounded by machinery.

\* Previous to 1850, phosphorus was comprised among the "Produits Chimiques."

† Previous to the 9th of July 1842, the imports of phosphorus were entered under the general head of "Goods non-enumerated."

The match having reached this point of perfection, some attention was given to the embellishment of the boxes by the various manufacturers, who tried to excel each other in the elegance, convenience, and security of the case, for which various materials were employed—for instance, card-board, wood, and metal—the latter being usually ornamented with coloured lacquers, and engineering.

With regard to the composition for the matches now in use, Dr. Ure, in the *Supplement to his Dictionary of Arts and Manufactures*, p. 153, gives the following recipe of Dr. R. Boettger:—

|                        | Parts. |
|------------------------|--------|
| Phosphorus             | 4      |
| Nitre                  | 10     |
| Fine glue              | 6      |
| Red ochre, or red lead | 5      |
| Smalt                  | 2      |

The glue is to be converted into a smooth jelly with a little water, and put into a warm mortar to liquefy; the phosphorus is then to be rubbed down with the gelatine, at a temperature of from 60° to 65° C. (140° to 150° F.), after which the nitre is to be added, then the red powder, and, lastly, the smalt, the whole being carefully mixed until it becomes an uniform paste.

Lucifer wood-matches that inflame without sulphur are prepared, according to Dr. Ure, by the ends being rubbed against a red-hot iron plate, and then dipped for a moment into melted white wax, contained in a shallow flat-bottomed pan.

In March 1842, Mr. Reuben Partridge obtained a patent for forming wooden splints by pressing, with suitable machinery, a block of wood against a steel plate perforated with holes, placed together as closely as possible. The wood is thus forced through the perforations, being first split as it advances, by their cutting edges, and comes out on the opposite side of the plate in the form of a multitude of distinct splints. Much attention has also been paid to the improvement of the apparatus for dipping the matches.

Before closing this short sketch of the manufacture of chemical matches, the Reporters wish to draw scientific and public notice to the terrible disease to which it sometimes gives rise. Dr. Lorinser, of Vienna, in 1845, first called the attention of men of science and the public to the fact, that individuals working in lucifer-match manufactories were subject to pain and swelling of the jaws, followed in many instances by exfoliation of the bone. This was repeatedly confirmed by other observers, and induced several Governments to institute inquiries into the matter. The results of all the investigations made into this interesting question have been collected by Doctors von Bilra and Geist, in a publication entitled *Die Krankheiten der Arbeiter in Phosphor-Zündholzfabriken*, Erlangen, 1847.

The disease has been observed principally in Germany, but it is also met with elsewhere, and especially in England.\* The Reporters had the opportunity of obtaining some information on the subject from Dr. Sieveking, who has examined the disease with much care as it occurs in the London manufactories. According to his observations, the affection assumes the same character as it has done in Germany, and attacks those only who are engaged in dipping the matches into the inflammable compound, and who are, therefore, more immediately exposed to the phosphorus vapour. Dr. Sieveking saw several of these workmen (dippers) who had lost almost the entire lower jaw. After these painful statements, it is important and consolatory to know that the same physician has not found the disease to be equally prevalent in all manufactories; and that if cleanliness be enforced, and the dietary of the workpeople well attended to, and especially if a complete and continuous ventilation of the workshop be kept up, no evil consequences ensue. Dr. Sieveking met with parties who had been engaged in dipping matches

for more than ten years, without exhibiting the slightest tendency to the complaint.

The importance of attending to the precautions indicated by these investigations can scarcely be sufficiently impressed upon the manufacturer. Much has been already done by several firms, especially in regard to ventilation, but much remains to be accomplished if this frightful scourge is to be entirely removed. For this reason manufacturers should direct their attention to an important discovery made by science, in the shape of the so-called red or amorphous phosphorus. Some few years ago Professor Schrötter, of Vienna, observed the curious fact, that if ordinary phosphorus be exposed during a certain period to a temperature of from 250° to 260° C. (482° to 500° F.), it is converted into a red modification, which no longer possesses the main characteristics of phosphorus, viz.,—volatility, fusibility, and inflammability at comparatively low temperatures. The poisonous qualities have also entirely disappeared in this modified condition of the substance. The amorphous modification of phosphorus, which but a few years ago was a mere curiosity in chemical laboratories, can now, however, be manufactured, according to a method proposed by Schrötter, in large quantities, and is likely to become an important article of commerce. The Chemical section of the Exhibition (Class II., 119, p. 199) contained a fine specimen of this substance, sent in by J. E. STERGE, of Birmingham. The red phosphorus being perfectly innocuous when handled, and not giving off fumes in the atmosphere, whilst it is as well adapted to the manufacture of matches as the ordinary phosphorus, it is fair to assume that its general adoption by lucifer-match makers will prove a further guarantee against the disease of the workpeople. It is right also to mention that DIXON, SON, and Co. have exhibited matches made with Schrötter's phosphorus (Class II., 126, p. 190). These manufacturers state that they are as cheaply and as easily made as the common matches, and are not so liable to fire in the making.

The number of exhibitors of imitation matches and other means of obtaining light is fourteen. The classification according to the several countries is as follows:—

|                      |    |
|----------------------|----|
| Austria              | 5  |
| France               | 1  |
| India                | 1  |
| Mecklenburg-Schwerin | 1  |
| Prussia              | 1  |

| Total                | 14 |

#### LIST OF EXHIBITORS.

BELL and BLACK, Bow Lane (Class XXIX., 243, p. 802). Imitation vestas, congraves, and wax-matches; camphorated round wood congraves.

DE MAJO, S., Trieste (Austria, 50, p. 1009). Imitation lucifer-matches in great variety.

DIXON, SON, and Co., Manchester (Class II., 126, p. 199). Matches made with Professor A. Schrötter's phosphorus.

FÜHR, H., Schüttenhofen and Goldenkron (Austria, 46, p. 1009). A large display of imitation lucifer-matches, in a variety of boxes.

HARRANS, P., Suhl (Prussia, 798, p. 1094). Imitation lucifer-matches.

HOFFMANN, C. and G., Wisoczan, near Prague (Austria, 49, p. 1009). Imitation lucifer-matches.

KUHN, J., Ulm (Wurtemberg, 102, p. 1119). A variety of imitation lucifer-matches.

LEFRANÇOIS, —, Paris (France, 301, p. 1191). Sliding boxes for lucifer matches, and taper-stands for lucifer-matches, and amadou, in great variety.

MEYER, W., Warnemünde (Mecklenburg-Schwerin, 6, p. 1134). Splints for lucifer-matches.

POLLAK, A. M., Vienna (Austria, 47, p. 1009). Imitation lucifers of several kinds.

RESCHL, F. and Co., Vienna (Austria, 48, p. 1009). Various descriptions of imitation lucifers.

\* *British and Foreign Medico-Chirurgical Review*, vol. i., p. 446 et seq.

RAJAH OF JESSELMERE (India, Class XXII., p. 919). Several steels for striking light, which are interesting as connecting the present with the past in the art of obtaining fire.

SANDELL, E., Putney (Class XXIX., 97, p. 796). Odoriferous lighters made of embossed card.

SUTORIUS, C. F., Gmünd (Württemberg, 100, p. 1119). Caneer-matches without the combustible material.

## VI. CONFECTIONARY.\*

The articles belonging to this species of preparations submitted to the Jury of Class XXIX. consisted firstly, of fruits, preserved with sugar; and secondly, of confections, comprising sweetmeats made both from sugar and from chocolate. Of preserved fruits, the Exhibition contained many examples; including some which had been prepared with sugar and subsequently dried, and others preserved and kept in syrup.

In the most ancient times, honey constituted the principal and nearly the only sweet substance used for those purposes for which sugar is now almost universally employed; and the Egyptian department in the Exhibition furnishes evidence that its use for the preservation of fruit is still continued in the valley of the Nile. Many interesting specimens of the most simple forms of preserves are also contained in the Turkish and Tunisian collections, consisting of the desiccated pulp of prunes or juice of the grape. It is possible that the former preparation may somewhat resemble the "cakes of figs" of the ancient Hebrews, which, from the two passages of Scripture wherein they are mentioned (1 Samuel, xxv. 18, xxx. 12), were evidently regarded as agreeable and nutritious food. That the Jews had some kind of artificial sweet preparation at a very early period of their history, is indicated by the statement that the taste of the manna "was like wafers made with honey" (Exodus, xvi. 31), though the parallel passage in Numbers, xi. 8, expresses it to have been like "fresh oil." The word Confection, and the term Confectionaries, as they occur in the Scriptures, have two distinct significations in connection with this particular subject. In the first instance, the strict original sense of the expression as derived from *con* and *facere*, to make up together, is intended; as in the words "thou shalt make it a perfume, a confection after the art of the apothecary, tempered together pure and holy," Exodus, xxx. 35. When, however, Samuel says to the elders of Israel concerning their king, that he would take their "daughters to be confectionaries, and to be cooks and to be bakers" (1 Samuel, viii. 13), there is a special and a distinct employment of the makers of some kind of preserves or sweet preparations referred to, of which no decided information is extant. From two well-known remarkable passages in the Prophets, there can be little doubt that the Hebrews were acquainted with the existence of the sugar-cane, probably as it was found in China.\* They both prove, however, that it was a very costly rarity; and the three words which in the Scriptures denote sweet substances, are all rendered honey in the Authorized Translation, though possibly they indicated several kinds of it. The passages which are supposed to refer to sugar are very different from these. "Thou hast bought me no sweet-cane with money," says the remonstrance in Isaiah, xliii. 24; and "To what purpose cometh there to me incense from Sheba, and the sweet-cane from a far country?" is the complaint in Jeremiah, vi. 20. In both these places the allusion is to an offering to the Almighty, which, presented in a right spirit, would not have been rejected. This, therefore, could not have been honey, because in Leviticus, ii. 11, the positive command is given, "Ye shall bury no leaven, nor any honey, in any offering of the Lord made by fire." The substance referred to must therefore have been either the sugar-cane, or the aromatic sweet-rush. The word rendered Calamus in Exodus xxx. 23, in the direction for making

the anointing-oil for the furniture of the tabernacle, is also *Kenah Bozen*, or sweet-cane, in the original; but this is generally supposed to mean the Indian *Calamus Aromaticus*.

Although the cane-sugar of Asia must have been well known to the classical ancients, yet they seem to have regarded it as a kind of fictitious honey. In this form Herodotus\* appears to refer to it, when he says that the Gyzantes have been "which make a great quantity of honey, and it is said that confectioners make much more." The original words of the historian in this place have the general signification of compounders, or workers, for the people.† From the context, however, it is evident that the terms are to be understood as implying preparers of confections, as they are also in another passage of the same author, wherein it is stated that the confectioners of the city of Calletabus "make honey with tamarisk and wheat." It may be observed farther, that the same word is likewise used in the title of the fragment of an epigram attributed to Menander relating to the making of a bride-cake. It consists of a short conversation, in which the operator represents that he has watched the preparation all night, but that there is yet much to be done. Such a person as this, who understood the art of confectionary as retained by the wealthy Romans, was called *Pistor Dulciarius*, or a baker of sweet things; and several of the bronze moulds which the pastrycooks of the time employed for the making of their sweetmeats, representing hearts, striated shells, animals, and a variety of elegant devices, have been discovered at Herculaneum. About the same period, also, Apicius, Columella, and Pliny prove that some fruits at least were preserved in syrup. The last author recommends that quinces should be boiled in honey, and directs that other sorts should be enclosed in wax. The latter process Beckmann states to have been likewise employed for preserving the apples carried every year from the southern districts of Russia into the northern parts of Siberia.

But though the value of sugar as a luxury was not unknown to the ancients, it was, from its first introduction to a comparatively late period, more commonly employed by physicians for the disguising of disagreeable medicines, and in the pharmaceutical preparation of syrups, electuaries, and confections. This practice appears to have led to the intimate connection which so long existed between the preparation of preserves and the compounding of drugs. Actuarius, who is considered to have flourished between the twelfth and fourteenth centuries, is said to have been the first physician who substituted sugar for honey in medicinal compositions; about which time also it was frequently used in cooking in England.‡ Dioscorides, in the first century, is the earliest author by whom it is mentioned by name, and he also notices its medicinal properties.

The art of making sweet compositions being thus early associated with the occupation of the apothecary, and his productions being known under the general title of confections, the same name appears, for a time at least, to have been used for the preparers both of sweetmeats and of medicine. In the thirteenth and fourteenth centuries there were certain officers, called apothecaries, retained by princes and great personages, who prepared various preserves for the table, especially fruit encrusted with sugar; but it is quite possible that these individuals were sometimes ecclesiastics, who also possessed the knowledge of medicine and pharmacy. Beckmann has recorded many curious notices illustrative of the connection existing between the professions of the apothecary and the confectioner, as they were publicly established in Germany from the middle of the fifteenth century. From these statements it is evident that the term *apothecarius* was then understood to signify the keeper of a storehouse or magazine for articles belonging to the *Materia-medica*,

\* Melpomene, xciv., cited in Pereira's *Elements of the Materia Medica*, 2nd edit., ii., p. 835. Herodotus, a new translation, by the Rev. H. Cary, 1848.

† *Δαμνιγοῖς ἑβέναι*. *Ἄρτεος δαμνιγοῖς*, Polymnia, xxxi.

‡ The *Forme of Cury*: edited by the Rev. S. Pegge, p. 26.

\* The earliest records of China make mention of the culture of the sugar-cane and the extraction of the sugar; the application of which as food appears to have been known in the most remote ages of Chinese history.

where also medicines might be properly compounded, and confections and cooling liquors prepared for the sick. These establishments were licensed by authority, and the persons who kept them endowed with exclusive rights and municipal privileges; in return for which they were sometimes required to supply the court or the town-council with confectionary or sugar, as well as to vend their medicines at appointed rates.

It is probable that in such a stipulation of furnishing confections and sugar to public authorities, originated the practice which became common in England in the sixteenth century, of presenting rich boxes of sweetmeats or lozenges to great personages on their journeys, or at certain seasons; or pastry of elaborate ornament as royal new year's gifts.\* Many curious instances of the latter custom will be found in the lists of new year's gifts made to Queen Elizabeth, of which the two following may here be adduced in illustration, as they include sweetmeats, preserved-fruits, and pastry:—"1562. By Revell, surveieur of the works, a marchpane, with the modell of Powle's church and steeple in paste. By John Hemingway, *potivary*; a pott of oringe-condytt, a box of pyne-comfyts, musked, a box of manus-cliffis, and lozenges."

Before this period the practice of the confectionary art had ceased to be confined solely to the compounders of medicine, and its productions had long since been regarded as belonging rather to festivals and banquets than to the dietaries of the sick. The delicacy and rarity of the articles used in confections, and the neat dexterity required in preparing them, probably suggested it as a most graceful female employment; hence we find that, in the seventeenth century, the art of making sweetmeats became established as a fashionable feminine accomplishment, and was publicly taught both in France and England.

#### *Manufacture of Comfits and other Bonbons.*

The following is a description of the processes employed at the manufactory of Mr. SCHOOLING (114, p. 796), one of the Exhibitors, of Bethnal-green, the workmen being chiefly French.

*Smooth-Comfits.*—The preparation of comfits is very simple. If seeds, such as almonds or carraway-seeds, are to be made into comfits, they are placed together with a cream made of sugar-syrup and starch, into a flat ellipsoidal copper pan, suspended by chains over a charcoal fire. By tilting the pan up and down, and at the same time giving it a circular swinging motion, the seeds are made to roll one over the other, and thus gather the pasty mixture as it dries. This operation is repeated as often as may be required for the seeds to accumulate a sufficient thickness. The form of the seed governs that of the comfit.

*Pearled-Comfits.*—Cinnamon, coriander-seed, and celery-seed are usually "pearled" by placing the mixture of syrup and starch into a copper funnel, suspended over the pan containing the comfits or seeds. This funnel is, in shape, like the small half of an egg, and has a round hole in the bottom, which is more or less closed by a long conical stick, suspended to the handle of the funnel, and passing through a guide to keep it central. By allowing the plug to descend sufficiently, it may be made to close the hole. The aperture is regulated in such a manner as to allow the mixture merely to fall in drops; at the same time a short jerking motion is given to the pan. The paste, as it dries, gathers on the comfits in little knobs, called pearls.

*Machinery for making Comfits.*—Mr. Schooling employs the following simple contrivance. An endless band, formed of strips of iron hoop riveted on two leather straps, traverses over four rollers, so placed that their axes, when seen on end, form an irregular square; the top roller at that end towards which the band travels being much higher than the top roller at the opposite end. The metallic band is not drawn tight, but left loose

in order that it may form a sort of bag to contain the materials, by drooping between the top rollers; the frame of the machine forming the ends of the bag. A coil of steam-pipes, following the curve of the band, serves to dry the comfits, which are gathered with a rolling motion up towards the highest side, and then rolled over in a contrary direction.

Another Exhibitor, Mr. WOTHERSPOON, of Edinburgh, (106, p. 796), employs an apparatus consisting of a steam-pan, open at one end, and revolving in a vertical direction on a hollow axis, through which the steam passes in, and the condensed water passes out. This pan is in shape like an orange, supposing a horizontal axis to be placed in the eye, and a disc of about a third part of the diameter of the orange to be cut out of the rind at the side opposite to the axis; and in order to complete the simile, supposing the rind to be hollow so as to contain steam. The seeds and syrup are placed at the open end, and by the slow revolution of the copper-pan are gathered up and rolled over in the same manner as on the endless band.

Messrs. OUDARD, SON, and BOUCHÉROT, of Paris (1374, p. 1242), also manufacture comfits by steam-machinery, and have done so since 1844: before this period a skilful workman could make from 45 lbs. to 55 lbs. per day, but at present he superintends six pans, each of which produces 112 lbs., so that in a day he manufactures 6 cwt., or twelve times as much as he could produce by hand. This machinery having been adopted by other Parisian confectioners, has caused a reduction of 30 per cent. in the price of comfits in France.

*Sugar-Pastilles* are made of a paste of powdered sugar and syrup, combined with such flavouring and colouring matter as may be required. A small quantity of this paste is heated over a charcoal-fire, and then placed in a spouted ladle. By inclining the ladle a small quantity oozes out at the spout, and is cut off with a wire; the drop, as it falls on a tin-plate, forms a flattened semi-ellipsoid; as soon as the tin plate is covered it is removed to the drying-stove. A single workman, in this way, can make three or four hundred-weight of pastilles in a day.

*Jujubes* are composed of a mixture of gum-mucilage and syrup, which is run into flat tin trays, and consolidated by evaporation in a chamber heated by steam. As soon as the cake has been sufficiently dried, it is allowed to cool, and is then cut into long strips by passing it through a pair of rollers, the bottom one being a plain cylinder, and the top one composed of a number of discs placed on an axis and kept apart at the required distance by collars; the strips are afterwards cut transversely with scissors.

*Motto or Surprise-nuts* are made by drilling out the thick end of the nut with a rose-cutter running in a lathe; the kernel is then removed, and the shell filled with mottos and comfits, and lastly stopped up with chocolate. Many toys are made annually by Mr. Schooling.

*Liquor-Bonbons.*—The manner of making liquor-bonbons is nearly the same, whatever may be their shape. A syrup is made with water and sugar, and is then taken a little at a time by the workman, who evaporates it to the proper consistence, and adds alcohol or some alcoholic liquor. In the mean time his assistants have prepared several moulds, by filling shallow trays with powdered starch, and impressing plaster-of-Paris models of the required form into it, so as to produce corresponding depressions. Several models are fastened on a rod, and thus a number of matrices are made at one operation. The workman then takes a portion of syrup, and runs it into the moulds either from the egg-shaped funnel, before spoken of, or from ladles having several spouts, according to the nature of his work; the latter being used for small drops, the former for large bonbons. The cohesion of the syrup being greater than its attraction for the starch, it runs away from the latter as water does from an oily surface; and the upper surface thus takes a spheroidal form. A little starch is now sifted over the surface of the mould, and it is then set aside in a warm closet. Crystallization commences on the outside of the bonbon, and forms a crust which encloses the syrup: this gradually yields more and more of its sugar, and becomes itself more dilute.

\* This custom is still kept up in France, as regards the presentation of boxes of sweetmeats on the first day of the new year; and will be noticed in speaking of the contributions from that country.

In this way a man and two boys will run off about 3 wts. of bonbons per day.

**Liqueur-Almonds.**—Almond-shaped liqueur-bonbons, which contain a syrup, are enveloped with the white mixture in the same way as smooth-comfits; but in order that they may not be destroyed in the operation, they are first covered with gum-mucilage, and then thrown into a mixture of gum-arabic and sugar reduced to a fine powder: they are afterwards dried, and again submitted to the same operation as often as is necessary to produce a coating of the desired thickness.

**Solid Sugar-Bonbons** are cast in the same way, but with a much stronger syrup.

**Gum-Drops.**—Gum raspberries are made of syrup and gum-mucilage; they are cast in the same manner, and dried to an elastic solid.

**Fondants**, which melt like ice in the mouth, are likewise run into starch-moulds; they are composed of a syrup, which is first evaporated to a certain point of concentration, and then beaten until it forms a frothy paste.

**Crystallized Bonbons.**—All the different kinds of sweetmeats hitherto described are sometimes covered with a crystalline coating of sugar, by putting them into a strong syrup contained in shallow trays placed on shelves in a drying-chamber heated by steam. A piece of linen is laid on the surface of the syrup to prevent its forming a crust; and by lifting this linen from time to time, the progress of the operation is ascertained: this usually occupies from one to two days. The excess of syrup is drained off in the same room, as soon as the sweetmeats are sufficiently covered with crystals of sugar; they are then removed and air-dried.

**Flowers, Piping.**—All piped ornaments are composed of a mixture of white of egg and sugar, which is called "glazing." For the modelling of flowers the workman uses a series of supports which, at the upper part, are of such a shape that they would nearly fit the under side of the flower; a depression being made in the summit to suit the shape of the calyx. The modelling-tools consist of a series of small funnel-ends not much bigger than a thimble, with openings of various shapes; as for example, narrow slits of different breadths, and round and other shaped holes of various sizes. These funnel-ends are fastened with gum to the bottom of paper funnels, into which the workman places the glazing, and then closes the funnel by doubling over the paper. By pressing the paper funnel with the thumb, he squeezes out just what he requires, and by dexterous manipulation, curls and twists it into any form he chooses. This operation is called "piping," and is much employed in ornamenting bride-cakes.

**Painted Bonbons.**—Bonbons intended to be painted are covered with a layer of glazing, and are then ornamented with coloured piping. The last finish is given by painting them with body-colours, mixed with gum-mucilage and syrup. The nature of the colours will be described hereafter in speaking of the contributions from France.

#### Manufacture of Chocolate—Confectionary.

The following is the method practised by the **PARS CHOCOLATE COMPANY** (France, 873, p. 1231), who in Class VI. have exhibited their machinery, which was made by M. G. Hermann, of No. 92 Rue de Charenton, Paris.

The cocoa, or cacao-nuts, are first screened to remove any dust, and are then roasted in a cylindrical or globular vessel, which revolves over a fire, the operation of roasting being one requiring much care and attention. After roasting, the husk is beaten off by means of a winnowing-machine. The roasted nuts are now placed in a triturating or mortar-mill, encased with an outer jacket, and heated to 50° C. (122° F.) by means of steam; by the action of this machine they are reduced to a thin paste, on account of the large quantity of oil which they contain. Sugar previously separately ground in a similar, but cold, mill, is now added, and the action of the hot-mill continued until it is well mixed with the cocoa-paste; vanilla is also added if the chocolate is to be flavoured with it.

The thick paste of sugar and cocoa is then levigated to the utmost degree of fineness, by means of a mill formed

of three rollers working in a horizontal plane; the second cylinder revolving at twice the speed of the first, and the third at twice the speed of the second. The chocolate-paste is put into a long funnel or "hopper," fixed over the two first rollers, which draw down a certain quantity on their surfaces, and by their mutual pressure, and difference of speed, spread it into a thin and even coating. The third roller, by working at a still quicker speed, produces a further grinding of the paste, which is scraped off by a ductor-knife and returned once or twice to the mill. A coil of steam-pipes placed under the machine prevents the cooling of the paste during the operation.

The manipulations of chocolate for confectionary are very similar to that already described for sugar-confectionary.

#### UNITED STATES OF AMERICA.

The preservation of soft fruits in brandy is an art of some importance in the United States, and one which every year is becoming better understood. The peach is the favourite conserve, large quantities of which are annually prepared, chiefly for home-consumption; but from the experience which the Exhibition has afforded of the possibility of sending them to England in a state of perfect preservation, there is but little doubt that they will soon traverse the Atlantic. The white flesh-peach is that deservedly most esteemed. Two American Exhibitors have sent Brandy-peaches.

#### BRITISH COLONIES.

**Candula** sends an unimportant contribution of confectionary, consisting of Horehound-candy, reputed in Canada to be a most excellent specific for a cold; a merit which an experiment did not confirm: and also another of Raspberry-vinegar.

From the *Cape of Good Hope* there is a collection of several kinds of preserved Fruits, which for the most part were found to be in a good state of preservation. Some are in syrup, and others partially dried. *Van Diemen's Land* has contributed Raspberry and Currant-jam, Green gooseberry-jam, Red gooseberry-jam, and Quince-jam.

#### CHINA.

The only description of confectionary in the Chinese section is the Finger-citron (*Citrus sarcodactylus*) preserved in syrup. Large quantities of sugar conserves of various kinds are, however, made in China, and it would have been interesting to compare them with those from other countries: jams, jellies, dry-conserves and syrups, are such as most resemble those of Europe; but besides these, are preserved seeds, as the Millet seed; roots, for example, the root of the *Nelumbium*, and the young tender shoots of various plants, as the bamboo.

The trade in these preparations is very extensive, both at Canton and Ningpo; and from the town of Foo-tcheou 44,000 lbs. were exported during the first half of the year 1846.\*

#### EGYPT.

The contributions from Egypt are very interesting, as representing not only the confectioner's art in Egypt at the present time, but also as offering to our view conserves probably identical with those of ancient history: they consist of Dates preserved in honey, from Two Exhibitors: one description is a preserve in clarified white, the other in dark-coloured honey. Besides these, there is a small quantity of Sugar-candy.

#### FRANCE.

The preservation of fruit in sugar, and the manufacture of sugar- and chocolate-confectionary, are highly important branches of industry in France; important, not only from the number of workpeople immediately employed in these manufactures, but also on account of several tributary arts connected with them, which occupy even a far greater number. The artist, the lithographer, the colourer, the varnisher, the paper-maker, the pasteboard-maker, the die-sinker, the embosser, the fancy-braid-maker,

\* *Etude Pratique du Commerce d'Exportation de la Chine*, par Natalis Rondot, pp. 69, 70.

the gold-and-silver-beater, and even the silk-weaver, are all more or less dependent on the demand for fancy boxes and "cornets" to contain bonbons and fruit: indeed, the trade of fancy-box-making owes its existence to the wants of the confectioner, who is still its chief patron. Other trades, appreciating the convenience and attractiveness of a pleasing envelope, have adopted boxes for most of their small wares; and "Cartonnage" has now become quite gigantic in its development, employing upwards of two thousand artisans, both male and female. Paris is the chief centre of the manufactories, which, for many months towards the close of each year, are all busily employed in preparing the enormous quantities of boxes, mostly distributed in a single day, the first of the new year, to the ladies of France. Many of these boxes cost the confectioner from 12s. to 40s. each, and when filled with confectionary, sell at enormous prices. The greater part, however, cost from 2d. to 2s. 6d. The preservation of whole fruits in sugar is carried on chiefly in the southern parts of France, by small collectors, who forward their produce to their correspondents in Paris. The Parisian confectioners then re-select them, cutting some into ribands, rings, and other fanciful forms, and arrange them in boxes for sale. Paris, on the other hand, supplies boxes to the departmental collectors, who put up in them their fruits for exportation. It is mainly owing to the great taste which the French display, not only in the boxes, but also in the arrangement of the fruit, that they have gained almost a monopoly in supplying the world with conserves: the selection of the fruit and its perfect preservation, however, are points which are carefully attended to, so as to perpetuate the reputation of the goods which an attractive exterior first brings into notice. Eight Exhibitors have sent fruits preserved in sugar, chiefly in syrup.

*Chocolate-Confectionary* is entirely of French invention, and is the kind of sweetmeat most esteemed in France. Its manufacture, however, is chiefly concentrated in Paris, and gives employment to about four hundred workpeople, the value of the annual produce being 160,000*l*. It is owing to the great attention which the French machinist has bestowed on the construction of the machinery employed in its preparation for the triturating and grinding processes, that the art has been carried to its present high state of perfection. Other nations are adopting French methods, and employing French workmen to attain a similar end. The French confectioner also displays much ingenious skill in casting a great variety of subjects in chocolate, which are usually afterwards covered with preparations of sugar ("glazing"), and coloured to represent the natural objects. The moulds, in which the casting is effected, are made of sheet-copper hammered to the required shape. Fruit, vegetables, cockchafers, spiders, and other insects, are the most frequently produced.

There are Three Exhibitors of Chocolate-confectionary in the French section.

*Sugar-Confectionary* is manufactured in France even to a much greater extent than chocolate-confectionary, and is that which is chiefly exported. Paris, the great centre of this branch of industry, employs seven hundred workpeople, males and females. The wages of the men average 3s. 4d. per day, and those of the women 8d. The value of its annual produce is 280,000*l*. The French confectioner is not a mere manufacturer of shapeless sweets, he is an artist; he studies not only the elegance of form in each bonbon, but also pays the minutest attention to the attractiveness of the grouping, and the correct contrasting of the colours. His ingenuity and invention are inexhaustible; every season he produces some novelty, and for years this competition has continued between himself and his rivals; and yet there is no abatement in his ardour or his success: now his production consists of a new box; now of some intricate interlacing of fruits; now of some wonderful crystallizations; and now of some new mode of concealing the motto: but in most cases his art is exerted tastefully to introduce a looking-glass. No house enjoys a higher reputation in Paris than its single representative of this art in the Great Exhibition.

In 1850, the exports from France, of syrups, sweetmeats, marmalades, jellies, and fruits preserved in sugar amounted to 983,350*lbs.*, in value 36,000*l*.

The French confectioner is not permitted to employ any substance he chooses, either in the manufacture of his sweets or the colour he uses to adorn them; the Minister of Agriculture and Commerce very properly interfering. He directs that the Prefect of each town shall carry out, in a proper manner, the instructions which have been laid down by scientific men; not only as to the materials employed, but also as to the coloured-papers used to envelope the sweets. These regulations, it will be observed, are very similar to those which were established for the government of the Apothecary-Confectioners of Germany in the fifteenth century; and it would be well if England took a lesson in this respect, and appointed a competent staff of chemists to examine from time to time the sweetmeats which are exposed for sale in the retail-shops.

The following list of colours, allowed by the French authorities to be used by confectioners, may be found of service to makers of sweetmeats in other countries:—

*Blues*.—Indigo dissolved in sulphuric acid; Prussian-blue; to which may be added Ultramarine, as preferable to Prussian-blue.

*Reds*.—Cochineal, Carmine, Carmine-lake (provided it contains no vermillion), Brazil-wood lake.

*Yellows*.—Saffron, French-berries, Persian-berries, Quercitron, Turmeric, Fustic, and the aluminous lakes of these substances.

*Green* is produced of different shades by mixing the various yellows and blues; but no kind of emerald-green must ever be employed, as it is a virulent poison.

*Violet*.—Logwood alone or mixed with bronze-blue (Chinese blue), in various proportions.

*Pansy-colour*.—Carmine and Prussian blue; or Carmine and Ultramarine mixed in various proportions.

*Colours for Liqueurs*.—Curaçoa is coloured with Brazil wood; blues are made with indigo prepared by adding alcohol to the sulphuric solution of indigo; and absinthe (wormwood) is tinted with a mixture of saffron and alcoholic indigo.

#### INDIA.

India sends a few Preserved-fruits, amongst them some pink-apples; but they have not arrived in good condition.

#### PORTUGAL.

There are as many Exhibitors of Conserved-fruit in the Portuguese as in the French Section, and the fruits leave nothing to desire in their preparation; but the Portuguese do not display the same taste in their arrangement, and lack for that purpose the charming paper-boxes which render the French fruit so presentable; hence the commerce in this article is much less flourishing than in France. The exports of Portugal are principally to Russia and Brazil; but a fair proportion comes to England. The preservation and arrangement of fruits are principally carried on in the nunneries, excepting only in the town of Evora-Elvas, which has lately taken a great start, and established regular manufactories. Eight Portuguese Exhibitors have contributed conserves; and One other a small quantity of comfits.

#### PRUSSIA.

One Exhibitor sends most excellent Preserves in Syrup. These conserves are an evidence that the art is perfectly understood in Prussia, and carefully practised. There is, likewise, an Exhibitor of Chocolate-confectionary, whose productions, however, are far behind those of France.

#### RUSSIA.

From this country there has been sent a small collection of various Crystallized fruits and marmalades prepared in the government of Smolensky. The collection comprises oranges, green-gages, apples, cherries, bergamotte-pears, pine-apples, and marmalades of different kinds. Though no Award has been made for these conserves, which had somewhat suffered, there was sufficient evidence of their having been so well preserved as to warrant a favourable notice being given of them in this Report.

#### SARDINIA.

From the Duchy of Genoa, several preserved Fruits in Syrup, crystallized sugar conserves, and a small quantity

of *Dragées*, are sent by One Exhibitor, G. ROMANENGO (Sardinia, 82, p. 1305); but, unfortunately, the bottles were so insecurely packed that the syrup had oozed out, which left the fruits in a bad condition; the fruits in boxes are, however, excellent. The comfits are well made, but not equal to those exhibited in the French department. The conserves of the Sardinian States are much esteemed, and form an important and increasing article of commerce. In the Duchy of Genoa there were, in 1843, 34 confectioners, who employed 146 workpeople, and produced 637,190 lbs. of sugar conserves, valued at 34,400*l.*; in 1846, 34 confectioners, who employed 150 workpeople, and produced 661,457 lbs. of sugar conserves, valued at 36,000*l.*; in 1847, the value of the conserves was 48,000*l.*; in 1848, the value of the conserves was 46,800*l.* In 1843 there were also twelve establishments for preserving fruits in the province of Nice.

#### SAXONY.

The contribution from this country consists only of a very large collection of Chocolate-figures, modelled with skill; several of the comic subjects are, however, of rather questionable propriety. The quality of the chocolate of which they were composed did not warrant an Award in favour of the Exhibitor, though he had made considerable exertions to produce a good display.

#### SPAIN.

Several kinds of Fruit, preserved with sugar and dried, and others in syrup, are sent from Spain by Two Exhibitors. These conserves are partly prepared in the convents, and partly in private manufactories. The quality of the fruit is unexceptionable; but in Spain, as in Portugal, there is felt the want of ornamental boxes, in order to set it off to the best advantage.

#### SWITZERLAND.

One Exhibitor sends a small quantity of Chocolate-lozenges of fair quality.

#### TUNIS.

The only contribution from this country is a small quantity of a sweetmeat, called *Kefla*, which is made of the dried juice of the grape, and is not unpleasant in flavour.

#### TURKEY.

No distinct Award has been made for the sweetmeats supplied from this empire, which are very numerous; for the reason before stated in speaking of soap and candles. The Turkish confectionary has, in many cases, the peculiarity of being flavoured either with musk or otto-of-roses. The most remarkable is a sweetmeat called *Rahatlocoum*; it is composed of 1 part of wheat-starch, 6 parts of sugar, and 12 parts of water; these are boiled together for some time, and when the mixture has lost so much of the water by evaporation that it will congeal to an elastic jujube-like mass, it is run into a flat tray and allowed to cool; sometimes blanched-almonds are mixed with it. This preparation, which is of agreeable flavour, is in great repute amongst the Turkish ladies, from its alleged property of developing those proportions of figure which, in their country, are deemed a most essential attribute of female beauty. About 600 tons of *Rahatlocoum* are made annually in Turkey.

The following Conserves also find a place in the Turkish collection: *Kyfta-anjou*, prepared from the dried juice of the grape; *Kyfta-anjou* with blanched almonds; *Pastia*, which is also prepared from grape-juice dried quite hard in thin scales; the pulp of the Persian prune (this has by no means an agreeable flavour); pistachio-nut-comfits, roots preserved in sugar and flavoured with musk; very good marmalade of plums; sugar-candy, pink and white; liquorice-syrup; and, lastly, dried liquorice-juice. Of all these the most agreeable is, without doubt, the *Rahatlocoum*.

#### UNITED KINGDOM.

England derives her supply of fruits preserved in sugar from countries more favoured than herself in cli-

mate, large quantities being annually imported from France (chiefly), Spain, Portugal, and her various colonies. The weight of fruits preserved in sugar or brandy, imported from all parts, during the year 1850, was 155,895 lbs., and yielded in duty 3,754*l.* There is one Exhibitor of foreign Preserved-fruits in the British Section. English jams, jellies, and orange-marmalade, which are prepared very largely throughout the United Kingdom, are not exhibited, probably under the idea that no interest would be attached to them.

Confectionary is manufactured, in enormous quantities, throughout the United Kingdom, and more particularly in Scotland. It is not possible to arrive at an exact knowledge of the quantity annually produced, nor even to make a tolerably accurate estimate as to its extent; but it is certain that two or three tons per week of lozenges are not an unusual produce for one house. From the result of inquiries amongst the sugar-brokers and confectioners, it may be safely stated that upwards of 150 tons of sugar are converted, every week, into sweetmeats; at 47*l.* per ton, the raw material used in one year, therefore, amounts to 366,600*l.*, to which must be added labour, flavouring, and a wholesale and retail profit. Besides this, 31,977 lbs. of Confectionary are annually imported, and pay a duty of 840*l.*

The manufacture of Chocolate-confectionery is only of recent introduction into England, and is carried on by Frenchmen and Italians. Two of whom exhibit their apparatus at work in Class VI. There are Three Exhibitors of Chocolate-confectionary in the British Department, One of whom exhibited chocolate quite equal to that made in France.

Crystallized Liqueur-confectionary, similar to that of France, is now made largely in England, and is quite equal in quality, but at a considerably less price than the French. This arises, to some extent, from the difference in the price of sugar, and also because the cane-sugar is more easily worked, or, as the workman expresses it, is stronger. For example, crystallized Liqueur-beans, *dragées*, and "drops" of English manufacture are sold wholesale at 8*d.* per lb., the price in France being 1*s.* 3*d.* As wages are considerably higher in England, the difference in price is the more remarkable.

By far the larger portion of sugar annually devoted to sweetmeats is carried off by "pipe," lozenges, and comfits of different kinds. The latter description is made chiefly in Scotland, which has long been renowned for its confectionary. Machinery is employed, particularly in the manufacture of lozenges, acidulated-drops, and comfits, so that the wholesale-confectioner is enabled to sell these kinds at prices but little above those of the raw materials; notwithstanding this, an unfair competition seeks still farther to diminish the price by admixtures of powdered gypsum. The acidulated-drop is a production peculiar to this country, the foreign confectioners not understanding its manufacture.

Bride-cakes are not wanting in the World's Great Show, nor should they be; for they are characteristic of English tenacity with respect to ancient customs, and few are older than the use of bread or cake at marriage-ceremonies, which, with the wedding-ring, has been derived from the heathens. The sprinkling of wheat on the head of the bride is a very old custom, and is now occasionally perpetuated, by the cutting of the cake over her head. Many other ceremonies are also still retained in connexion with the bride-cake; as the passing of very small pieces of it nine times through the bride's ring, in order that the bridesmaids may place a piece beneath their pillows at night, and dream of their lovers. No less than Three gigantic Bride-cakes adorn the counters of the North Transept Gallery, varying in value from 30*l.* to no less a sum than 150*l.* One, it is said, possesses the advantage of moveable ornaments, so that after the cake has disappeared, the sugar may be transmitted, like the silk-dresses of our ancestors, as an heir-loom from the grandmother to her grand-daughter! The Three Exhibitors are R. GUNTER (112, p. 796), MOORE and MURPHY (232, p. 802), and R. VINE (113, p. 797). Although these bride-cakes were not considered of sufficient importance in a mercantile point of view to warrant the Jury in

making them the subjects of a distinct Award, they are here mentioned as being the best of their class. The sugar-ornament of the last-named is quite remarkable as a piece of "sugar-piping."

The number of British Exhibitors of Sugar-confectionary is Eleven. There are likewise Two Exhibitors of Confectioners' ornaments, and Three Exhibitors of Biscuits.

#### WURTEMBERG.

To judge by the contributions to the Exhibition, the forte of the Wurtemberg confectioners is rather in the production of non-edible ornaments than confectionary itself; there being Three Exhibitors of the former, and only One of the latter. The confectionary which is crystallized is, however, excellent.

The number of Exhibitors in this subdivision is Sixty-six; of these there are:—

|    |                                  |
|----|----------------------------------|
| 17 | Holders of a Prize Medal.        |
| 5  | Who obtained Honourable Mention. |
| 44 | Unrewarded.                      |
| 66 |                                  |

The classification of Exhibitors, according to the various countries, is as follows:—

|                    |           |    |
|--------------------|-----------|----|
| America            | - - - - - | 2  |
| British Colonies:— |           |    |
| Canada             | - - - - - | 2  |
| Cape of Good Hope  | - - - - - | 1  |
| Van Diemen's Land  | - - - - - | 1  |
| China              | - - - - - | 1  |
| Egypt              | - - - - - | 2  |
| France             | - - - - - | 13 |

Of these, Thirty exhibit Fruits preserved in syrup or brandy; Eighteen exhibit Sugar-confectionary; Nine, Chocolate-confectionary; and Five, Confectioners' ornaments; the remaining Four exhibit sweet-biscuits.

#### LIST OF AWARDS.

ALVARGONZALEZ, R., Oviedo (Spain, No. 177, p. 1340), Prize Medal.—Fruit exceedingly well preserved in syrup; comprising Greengages, Peaches, Apricots, and Strawberries.

AUDLERO (Widow), and P. LEDOUX, Paris (France, No. 1059, p. 1229), Prize Medal.—For an assortment of French Comfits, Liqueur-bonbons, and *Pastillage*-figures (composed of sugar and white of egg, or sugary gum, or starch). The bonbons are arranged with great taste in fancy boxes and *corbelles*, and much skill is displayed in the modelling of the *pastillage*-figures.

BAUR BROTHERS, Biberach (Wurtemberg, No. 87, p. 1119), Prize Medal.—For a very extensive collection of Confectioners' ornaments, many of which are very humorous. They are composed of gum-tragacanth and starch, so that, if eaten, no ill effects would arise, but they are intended only as ornaments. The largest piece represents the cathedral of Cologne, and contains a musical-box. In Germany, storks are reputed to bring newly-born infants, and we find, accordingly, one of these birds carrying a child in a small box strapped on his back.

CASTELLAN, F., Lisbon (Portugal, Nos. 422 to 425, 426, 428 to 433, 438, p. 1312), Prize Medal.—Figs, Plums, Peaches, and Pears as dry conserves; Sweet-plum, Apricots, Tangerine-oranges, Figs, Cherries, and Peaches pre-

served in syrup, with their natural flavour and perfectly sound.

CHEVET, jun., Paris (France, No. 121, p. 1177), Prize Medal.—Cherries, Pears, Apricots, and other fruits preserved in syrup. These are of the highest class, both as regards the choice of fruit and careful preparation.

COMBES, The NUNNERY of (Portugal, No. 417, p. 1312), Prize Medal.—For a large and tastefully-arranged box of Conserved-fruits in great variety, and in the highest state of perfection.

FORTNUM, MASON, and Co., Piccadilly (Class III., No. 55, p. 204), Prize Medal (the same Award by the Jury of Class III.).—A very extensive collection of the finest Preserved-fruits of various countries. For the care bestowed in the selection and arrangement of this (the largest) collection of costly conserves, the Jury has awarded the Prize Medal.

LOUNDERBACK, M. J., Cincinnati (United States, No. 7, p. 1433), Prize Medal.—White or Heath-peaches preserved in brandy, of delicious flavour, and in a perfect state of preservation. The name Heath is derived from the surname of the grower who first introduced them.

OUHARD, L., Son, and BOUCHEROT, Paris (France, No. 1374, p. 1242), Prize Medal.—For the care in selecting, and taste in arranging, in ornamental forms and in boxes, a great variety of Preserved-fruits; and for Comfits and Sugared-almonds of excellent quality.

PARIS CHOCOLATE COMPANY, Regent Street (Class III., No. 30, p. 202), Prize Medal.—Awarded for most excellent Chocolate-confectionary, in a great variety of forms, all of which was found to be carefully prepared and well-flavoured; and also for an assortment of Syrups, which, on dilution form very agreeable and refreshing beverages.

PERRON, E., Paris (France, No. 343, p. 1193), Prize Medal (the same Award by the Jury of Class III.).—Chocolate-confectionary, prepared in granite mills, and torrefied by steam. This preparation is exhibited in a great variety of forms: amongst other matters, there is a Basket made of chocolate, filled with Chocolate-bonbons, which are well flavoured and of most excellent quality.

PHILIPPE and CANAUD, Nantes (France, No. 956, p. 1225), Prize Medal.—Excellent Fruits, preserved in syrup, and comprising Peaches retaining the delicacy of their flavour, Pears, Raspberries, and Cherries, all of which are free from any signs of fermentation.

RODEL and Sons, Bordeaux (France, No. 992, p. 1226), Prize Medal, for a collection of the following fruits, perfectly preserved in syrup, viz.:—Cherries, Pears, Apricots, Greengages, Raspberries, Peaches, and Strawberries, which have retained their natural flavour, and are free from fermentation.

ROTH, W., jun., Stuttgart (Wurtemberg, No. 89, p. 1119), Honourable Mention accorded for a large collection of well-manufactured Liqueur-bonbons, both crystallized and smooth.

ST. PELAYO, The NUNNERY of, Oviedo (Spain), Prize Medal.—For a collection of Marmalades of excellent flavour. They are of firm consistence, and are packed in thin round boxes.

SCHOOLING, H., Bethnal Green (Class XXIX., No. 114, p. 126), Honourable Mention,\* for Liqueur-bonbons agreeably flavoured and in every respect well made, crystallized and smooth, generally known as French sweetmeats. Some of these are flavoured with artificial essences. (See page 637.)

TROGLEN, G., Ulm (Wurtemberg, No. 91, p. 1119), Honourable Mention is accorded to this Exhibitor, for a Confectioners' Ornament, representing a Lion-hunt, well modelled in gum-tragacanth, sugar, and starch, and coloured with vegetable-colours.

TURPIN, F. A. (Widow), Paris (France, No. 1046, p. 1228), Prize Medal (the same Award by the Jury of

\* But for a misstatement contained in a label attached to these productions, by which it was made to appear that they were manufactured in France under the immediate inspection of the proper authorities, a Prize Medal would have been awarded to Mr. Schooling. The Reporters are now enabled to state that the employment of this label has been discontinued.

*Class III.*), for a large collection of very excellent and carefully prepared Chocolate-confectionary, made up into *dragées*, and representing fruits and roots; for instance, potatoes, nuts, chestnuts, turnips, radishes, dates, black currants, hips, and plums; all of which are imitated with skill.

**VOLSTEED**, J. P. (Cape of Good Hope, No. 35, p. 302). Honourable Mention is accorded for the following conserves, which are exhibited both in syrup and in the candied state, viz.: Nartjes (a small orange), the Bitter-orange, Green-figs, and Citrons.

**WEATHERLEY**, H. (Class III., No. 27, p. 302), Honourable Mention.—Sugar-drops, flavoured with artificial essences or compound-ethers, designated by names derived from their resemblance to the savour of various fruits; as essence of pear, of pineapple, &c. (see page 637). The major part of these drops are flavoured with a single compound-ether, but in some cases a combination of several is used.

**WEILL**, C., Berlin (Prussia, No. 20, p. 1049), Prize Medal (*An Honourable Mention accorded by the Jury of Class III.*).—Whole Pine-apples, Peaches, Apricots, Pears, Plums, and Walnuts in the husks, preserved in syrup. The soft fruits have retained their natural flavour, and are quite free from fermentation.

**WOTHERHOOP**, J., and Co., Glasgow (Class XXIX., No. 106, p. 796), Prize Medal.—Very excellent Scotch-confectionary, manufactured by steam machinery, and consisting of eighteen kinds of Lozenges and several descriptions of Comfits, which were found to contain no other material, than sugar, starch, and vegetable-colouring.

## B.—MANUFACTURES RELATING TO NATURAL HISTORY.

### I. ARTIFICIAL FLOWERS AND FRUIT.

Under this general designation two very distinct classes of articles have to be separately considered, namely, Imitative Flowers and Fruit, modelled in wax, and the same subjects formed from other materials. The Wax-flowers, from their fragility, are chiefly restricted in their application to purposes of decoration, and require less difficult manipulations for their successful production than those made of cambric, feathers, or similar materials, and destined for more general application. Wax-flowers are, however, occasionally used as articles of toilet.

In examining the Wax-flowers, which are usually intended to form isolated ornaments, we require truthful imitations of Nature, and taste in the selection of forms or grouping, the manufacturing skill required resolving itself almost wholly into the execution of form and the application of colours.

In the latter class, however, are included those productions to which the term "Artificial Flowers" is usually more especially applied; and it presents other qualifications besides those offered by the flowers modelled in wax, the artistic merits being more closely connected with the process of their manufacture. Accuracy of form and colour, and taste in the choice of examples and in the grouping, are of equal importance in the work; and there is usually more skill required for the imitation of the natural texture: but in addition to these qualities we have also to consider other peculiar excellencies of the articles produced, such as durability, the advantageous application of varied materials, and, finally, cheapness of production.

Such are the principles by which we have been guided in the examination of the several specimens of Artificial Flowers submitted to the Jury of this Class.

#### AUSTRIA.

The contributions from Austria are sent by two Exhibitors, both of whom display small collections of cheap Miniature-flowers, in which the trifling cost is the chief merit.

#### BRAZIL.

The contributions from Brazil are only four in number, and undoubtedly the most beautiful of them is that

belonging to Class XXIX., consisting of a splendid Bouquet of Feather-flowers, including the Coffee, Cotton, and Tobacco-flowers, &c. The name of the manufacturing artist was not stated; but an Award has been made in favour of the Exhibitor, who is an Englishman resident in London.

#### BRITISH COLONIES AND CHANNEL ISLANDS.

Many of the examples exhibited by the Dependencies of Great Britain have an especial and a very high interest attaching to them, since they may be supposed to represent with sufficient accuracy a great variety of plants and fruits generally unknown in Europe. The Jury have not rewarded them as works possessing great artistic merit, but they nevertheless fully appreciate the laudable desire to impart information evinced by the numerous Colonial Exhibitors who have contributed the several specimens they record.

*Bahama Islands.*—The Misses GREIG (p. 976) send a bouquet and a vase made of brilliant shells, and Mrs. E. BARNETT (p. 975) an important and very interesting collection of Thirty-two Wax models of Fruits, which appear to have been made and coloured with minute attention to accuracy in the imitation of Nature. But by far the most important contribution of this description is displayed by Three Exhibitors in the *Barbadoes* department; though the whole of the specimens appear to have been executed by Mr. and Mrs. BRAITHWAITE (1, p. 972), who are residents of that island. These examples, which are upwards of a hundred and fifty in number, comprise Bulbs, Roots, Plants, Flowers, Fruit, and Seeds, and reflect much credit on the modellers, for their attention to correctness of detail, a point of far greater importance than artistic grouping, when the intention, as in the present instance, is to convey a correct idea of the objects represented.

*Guernsey* sends a small stand of Wax-fruit.

*India.*—The examples which have been collected from Gokak, in the Mahratta country, Travancore, and Rohilkund, comprise models of about seventy varieties of Flowers and Fruits. Although possessing but little artistic merit, these numerous specimens form a most interesting and instructive display.

*Jamaica.*—Mrs. NASH (p. 971) contributes several ornamental groups of flowers made of the fibres of the Yucca or Dagger-plant.

*Malta.*—ANTONIO GERADA and his daughters (32, p. 946) exhibit a basket of rich Shell-flowers.

*Mauritius.*—The Countess GREY (1, p. 956) sends a Basket and Wreath of Flowers from the *Séchéelles* Islands, made of Palm-leaves; and Madame CHAPON and the Mlles. GANCOURT contribute several Bouquets in Shell-work.

#### FRANCE.

It must be conceded that the manufacture of Cambric-flowers is a purely French, or, to speak more correctly, a Parisian art; for although its origin is Italian, and that it is now carried on in other countries, the productions are usually copies from French models. Indeed, Cambric-flower-making as much belongs to Paris as the manufacture of silks to Lyons, or ribbons to St. Etienne; and, so extend the parallel even still further, as cotton to Manchester, or cutlery to Sheffield. The importance of the manufacture of cambric-flowers will be better appreciated when it is stated that the value of these productions, in 1847, was 442,226*l.*; and notwithstanding the high import duties of 25 per cent. in England, of 33 per cent. in the United States, and of 40 per cent. in Russia, that French-made flowers to the declared value of 68,000*l.*\* were exported in the same year, principally to those countries, namely,—to Belgium 12,400*l.*, to the United Kingdom 21,120*l.*, to the United States 17,600*l.*, to all other parts 25,880*l.* No branch of industry presents a more complete instance of the subdivision of labour than artificial flower-making. Few of the manufacturers carry on all the operations on their own premises. Beside the cambric, muslin, gauze, velvet,

\* It is estimated that the selling value is nearly double this sum.

silks, &c., supplied from Lyons, St. Quentin, and St. Etienne, there have been distinct manufactories established for many others of the component materials of these graceful ornaments. Thus the Dyes and Body-colours are prepared expressly for this art by manufacturing chemists; the materials, as Coloured-papers, Buds, Leaves, Stamens, Pistils, Fruits, and similar articles, are usually made in workshops devoted exclusively to their production; and in some instances, as may be seen by the contributions to the Exhibition, only one description is made in one manufactory. In 1847 there were forty-eight manufacturers of such materials in Paris, who employed 478 workpeople, and produced goods valued at 47,156*l*. The flowers are composed from their separate component parts in other workshops, some of which have a reputation for one kind only; and lastly, the grouping together of the various flowers is effected in the warehouses of the vendors, who are termed "*monteurs*," of whom, in 1847, there were 574 in Paris, who employed 5,675 workpeople, and produced goods to the value of 395,070*l*. It must, however, be stated, that there are some manufactories in which by far the greater number of these operations are carried on. In most cases, however, each workshop is restricted to the exercise of some particular branch. This will be more readily understood when it is stated that there are no fewer than six hundred and twenty-two manufactories in Paris (including the forty-eight preparers of materials before named), which on the average annually produce goods amounting in value to 711*l*, supposing the total production equally distributed between them; but this is far from being the case, for in 1847,—

|             |   |                       |                     |
|-------------|---|-----------------------|---------------------|
| 12 returned | — | —                     | 8,000 <i>l</i> .    |
| 8           | " | from 4,000 <i>l</i> . | to 8,000 <i>l</i> . |
| 33          | " | " 2,000 <i>l</i> .    | " 4,000 <i>l</i> .  |
| 63          | " | " 1,000 <i>l</i> .    | " 2,000 <i>l</i> .  |
| 131         | " | " 400 <i>l</i> .      | " 1,000 <i>l</i> .  |
| 104         | " | " 200 <i>l</i> .      | " 400 <i>l</i> .    |
| 182         | " | " 40 <i>l</i> .       | " 400 <i>l</i> .    |
| 89          | " | less than —           | — 40 <i>l</i> .     |

622

In 1847 there were 6,153 workpeople employed in cambric-flower making, namely:—

|                                  |
|----------------------------------|
| 414 men.                         |
| 5,063 women.                     |
| 19 boys, from 6 to 16 years old. |
| 657 girls ditto ditto.           |
| 6,153                            |

The men earn, on the average, 3*s*. per day, the women 1*s*. 7*d*. per day: the youths and girls, being mostly apprentices, receive, in most cases, no remuneration beyond their board and lodging.

Two of the Exhibitors, M. CONSTANTIN (94, p. 1175), and M<sup>r</sup>. FÜRSTENHOFF (492*a*, p. 1201), contribute specimens which show to what a surprising degree of perfection the imitation of nature may be carried in this art. Indeed, the productions of M. Constantin are so perfect that they will allow of the scrutiny of a magnifying lens. In one instance, during the examination of his case, it was so doubtful, even with the aid of the glass, whether a real object had not been used, that the Exhibitor pulled a specimen to pieces to convince the Jury. Both M. Constantin and M<sup>r</sup>. Fürstenhoff are, it appears, accomplished botanists, having followed regular courses of scientific study; and no higher proof could be afforded of the value of such training than the examples they display. It is productions such as theirs that have stimulated the manufacturers of articles of more general sale to improve their goods, by imitating, so far as is consistent with cheap production, the excellences brought before them from time to time at the French *Expositions*. These periodical displays, by producing a healthful rivalry among the "*monteurs*," in the tasteful selection and grouping of the various flowers and leaves for articles of dress, have, in this respect also, been of most essential

service in developing the capabilities of this important trade. For however meritorious and commendable the truthful imitation of plants may be, this excellence is insufficient of itself to induce a large home-consumption, or to create and maintain an extensive export trade. It is to the great talent of the Parisian "*monteurs*," in harmoniously grouping together a variety of stems, leaves, buds, and flowers, for head-wreaths, dress-trimmings, and bouquets, as much as to the skill of the makers of these flowers, that Paris owes its high reputation in this art; and so much diversity as to skill exists among the various artists, that it is known that the same flowers have a double value when arranged by one, to what they would have if by another of them.

## HAMBURG.

The contribution consists of a frame of artificial flowers, which does not call for any especial comment.

## HESSE DARMSTADT.

Flowers and fruit, modelled in wax, contributed by one Exhibitor, are average productions of their class.

## MEXICO.

The contributions from Mexico comprise a few examples of wax-flowers and wax-fruit.

## NASSAU.

A few specimens of wax-fruits form the only contribution from Nassau in this Department.

## PORTUGAL AND MADEIRA.

The Portuguese Department contains some excellent specimens of cambric-flowers, partly contributed by M. Constantin, who, under his real name of MARQUES (1299, p. 1318), pays this tribute to his native country. From the Island of Madeira are displayed specimens of those very beautiful feather-flowers for which it is so justly renowned. They are executed principally in the Nunnery of Santa Clara, in favour of which an award was made. Other specimens are exhibited in the North-East Central Gallery, contributed by an English Exhibitor. There is also an extensive series of wax-fruits from II. FERREZ and his sisters (2 Madeira, p. 1319), which deserve favourable notice.

## SWEDEN.

Madame FÜRSTENHOFF (27, p. 1351), whose beautiful productions have been spoken of under the notice of France, adorns the department apportioned to her native country with a selection of her admirable imitations of nature.

## UNITED KINGDOM.

As the French may be regarded as superior in the construction of Cambric-flowers, so the British surpass all other Exhibitors in the manufacture of wax-flowers. This is indeed as truly a British manufacture as the making of cambric-flowers is French. In many instances those who practise the art are ladies, who having first acquired it as an accomplishment, subsequently devote their leisure to its pursuit; but it is also executed by those who follow it as a profession. The remarks which have been already made respecting the productions of two of the French Exhibitors may with equal truth be repeated here in regard of the contributions of the MINTORNS (p. 795), and Mrs. STRICKLAND (p. 754). In their productions even the minutest details of the plants are represented with microscopic truthfulness; and in all there is evinced an amount of careful and patient study deserving of the highest praise. In respect also of the examples displayed by the other Exhibitors, it is not too much to say that there are but few which could be said to possess only an ordinary degree of merit.

In the making of cambric-flowers the aim of the British artists has not been so high, and although meritorious commercial articles are rewarded; still the generality of the contributions are below those of the same species in the French Department. At present a large

quantity of the better description of cambric-flowers is imported annually into the United Kingdom. In 1850, for example, the imports amounted in value to 61,634*l.*, and 15,409*l.* were paid for the duty upon them.

Shell-flowers, wax-fruit, and, lastly, feather-flowers, find a place in the British contributions to Class XXIX.

#### WURTEMBERG.

The contributions from Wurtemberg, which are creditable, are from two Exhibitors, one of whom sends materials for flower-making, and the other finished flowers made of cambric.

There are seventy-four Exhibitors of artificial flowers and fruit; of these there are—

- 1 Holder of a Council Medal.
- 16 Holders of a Prize Medal.
- 10 Who obtained Honourable Mention.
- 47 Unrewarded.

74

The classification according to the various countries is as follows:—

|  |   |   |   |   |   |    |
|--|---|---|---|---|---|----|
| Austria                                | - | - | - | - | - | 2  |
| Brazil                                 | - | - | - | - | - | 1  |
| British Colonies and Channel Islands:— |   |   |   |   |   |    |
| Bahamas                                | - | - | - | - | - | 2  |
| Barbadoes                              | - | - | - | - | - | 3  |
| Guernsey                               | - | - | - | - | - | 1  |
| Halia                                  | - | - | - | - | - | 1  |
| Jamaica                                | - | - | - | - | - | 1  |
| Malta                                  | - | - | - | - | - | 1  |
| Mauritius                              | - | - | - | - | - | 2  |
| France                                 | - | - | - | - | - | 15 |
| Hamburg                                | - | - | - | - | - | 1  |
| Hesse                                  | - | - | - | - | - | 1  |
| Mexico                                 | - | - | - | - | - | 1  |
| Nassau                                 | - | - | - | - | - | 1  |
| Portugal (3), and Madeira (1)          | - | - | - | - | - | 4  |
| Sweden                                 | - | - | - | - | - | 1  |
| United Kingdom                         | - | - | - | - | - | 34 |
| Wurtemberg                             | - | - | - | - | - | 2  |

Total - -

The Seventy-four Exhibitors admit also of classification according to the nature of the articles which they have contributed, in the following arrangement:—19 Exhibitors of Wax-flowers; 14 of Wax-fruit; 6 of Materials for Cambric-flowers; 17 of Cambric-flowers; 1 Exhibitor of Grape Mourning-flowers; 5 Exhibitors of Feather-flowers; 5 of Shell-flowers; 6 of flowers of other materials, as Braid, Rice-paper, Palm-leaves, Spun-glass, and Beads; and 1 Exhibitor of flowers for table decorations, cut out of turnips.

#### LIST OF AWARDS.

ADAMSON, O. G., Panton Street, London (Brazil, 1, p. 1429), Prize Medal, for a very large and elaborate group of Brazilian flowers, executed in Feathers obtained from the plumage of Brazilian birds. It exhibits wonderful brilliancy of colour, and much accuracy of form. The mechanical execution is very good, and much taste has been displayed in the arrangement of the bouquet.

BÄRTKAU, C., Paris (France, 1112, p. 1231), Honourable Mention, for Artificial Flowers, Plumes, &c. These decorative articles are of good quality, and well designed.

BÜRGEL, J., Vienna (Austria, 700, p. 1043), Honourable Mention, for a collection of Miniature Artificial Flowers. This collection is chiefly noticed as containing examples of a manufacture which is carried on rather extensively in Catholic Germany. The specimens do not possess any high artistic merit, since they are cheap products for commercial purposes.

CRAIGOT, A., sen., Paris (France, 1130, p. 1232), Prize Medal, for Feathers, Bouquets, Artificial Flowers, and Vases. Manufactures of a more common class than most of the other collections, and intended to supply large

consumers and the export market, for which they are good and well executed. The colours and grouping, as is usual in French articles, are of a superior character.

CHISHOLME, EMMA, Edward Street (Class XXIX., 78, p. 795), Honourable Mention for Wax-flowers botanically accurate, especially a group of *Orchidaceæ*; a Rose-tree is also executed with much skill. This is, on the whole, a very creditable collection.

CONSTANTIN, J. MARQUES, Paris, and Regent Street, London (France, 94, p. 1175), Council Medal, for a large case in the Area of the East Nave, and a case in the South-East Gallery. The productions of this maker are of the very highest quality, and the imitations of entire plants in the large case display not only great skill in construction, but so intimate a knowledge of their botanical character as to render them available for purposes of instruction as well as decoration. The material of which they are made is chiefly cambric, with which the imitation of texture is most successful. For general truth and natural character, especial attention may be drawn to the Prince's-feather, Sun-flower, *Aristolochia*, and other plants of intricate conformation, which are productions of the first order in this class of objects. Most deserving of commendation also, is the admirable skill with which are portrayed the several stages in the development of plants, from the budding blossom to the decaying flower, from the opening leaflet to the fallen and withering foliage: even accidental fractures are delineated with surprising truthfulness. The case in the Gallery contains a collection of Flowers, Wreaths, Bouquets, &c., of similar construction, but of less elaborate work, and more adapted for general purposes. These flowers are not only characterised by the same kind of excellencies as the others, but in their manufacture a solidity and durability of high importance has been secured. (See *Prefatory Remarks*.)

DORVELL, ELIZABETH, Oxford Street (Class XXIX., 77, p. 795), Prize Medal, for wax-flowers. The groups in this collection are most exquisite, from the tasteful selection of subjects and the arrangement of colours. The flowers are well made and very accurate. The model of the *Victoria Regia* is also good.

EWART, HENRIETTA, Bath Place, New Road (Class XXIX., 75, p. 795), Honourable Mention, for wax-flowers, deserving of commendation for the good selection and arrangement of the subjects of the groups, also for their mechanical execution and botanical accuracy.

FISHER, JOSEPH, Cripplegate Buildings (Class XXIX., 80, p. 795), Honourable Mention for imitation flowers in pots, &c. These articles are intended for decorations on a large scale, for rooms, &c., and, therefore, are of a somewhat rougher character than those intended for personal ornaments. There is a degree of stiffness about them, but they are, on the whole, very creditable; more particularly the Fuchsias.

FLORIMOND, —, Paris (France, 1224, p. 1236) Honourable Mention, for artificial flowers, &c. Artificial flowers as applied to head-dresses; fruits and flowers. These, though not of the highest class, are deserving of praise for the taste displayed in the grouping.

FOSTER, SON, and DUNCAN, Wigmore Street (Class XXIX., 74, p. 795), Prize Medal, for articles used in the manufacture of artificial flowers, feathers, &c. The materials are good, and brilliantly coloured. Interesting specimens of unfinished flowers are exhibited, illustrating the mode of manufacture. The finished flowers, as well as the feathers, &c., are very beautiful articles, taking a high place among the commercial productions of this class.

FÜRSTENHÖFF, EMMA, Paris (France, 492A, p. 1201), Prize Medal, for artificial flowers, manufactured from muslin and crape, to facilitate the study of botany. There is much merit in this collection, but this depends chiefly upon their beauty and fitness for ornamental purposes; since, although botanically accurate, the examples are chiefly of double and cultivated flowers, which are of inferior value for the purpose mentioned by the exhibitor.

GATTI, A. and G., Coppice Row, Clerkenwell (Class XXIX., 73, p. 795), Honourable Mention, for artificial

flowers and articles used in their manufacture, such as leaves, buds, and other components of flowers; chiefly of common material, but very good in regard to colour, some of the tints being exceedingly bright and rich. The flowers are extremely accurate in their imitation of nature, and are mostly well selected for the peculiar class of article. As cheap commercial productions, this collection deserves commendation.

GAUDET-DU-FRESNE, Paris (France, 842, p. 1220), Prize Medal, for manufactured leaves for artificial flowers. This collection contains a large assortment of leaves, executed in a peculiar manner; and though restricted to a special branch of the manufacture, is remarkable for the variety and beauty of the specimens, which exhibit a very fair amount of natural character.

HARAND, E., Paris (France, 863, p. 1221), Prize Medal, for head-dresses, trimmings, &c. These are very good commercial articles, suited for superior markets, and exhibiting great taste and accuracy in design.

LEFORT, —, sen., Paris (France, 1295, p. 1238), Prize Medal, for materials for artificial flowers. This maker has produced papers and stuffs of most brilliant colours, and in very perfect series of gradations of tint: the paper stained with carthamus-red (safflower) is especially remarkable for the purity and vividness of its colour. These, as well as the more advanced forms of the "materials," such as leaves, sprigs, buds, berries, or other fruits, for the construction of bouquets and wreaths, are excellent specimens of a class of manufacture carried on upon a large scale for the supply of a cheap market.

LUMSDEN, J., Trevor Terrace, Knightsbridge (Class XXX., 125, p. 829), Prize Medal for wax flowers. An exceedingly-graceful and truthful group, executed with much skill and artistic feeling. The colours are chosen with excellent taste, and the effect of the whole is very beautiful.

MAKEPEACE, ELIZA, Manor Place, Clapham (Class XXX., 185, p. 831), Honourable Mention, for wax flowers, distinguished by their accurate representation of nature, and the delicacy and beauty of the colouring. They are exceedingly well adapted for scientific illustration.

MINTORN, JOHN H., HORATIO, ELIZABETH, and REBECCA, Soho Square (Class XXIX., 70, p. 795), Prize Medal, for a very large and beautiful collection of wax flowers. The plants in the large case are very accurate and life-like, and well-adapted for scientific museums, to which they are especially suited from the truthfulness with which they represent the botanical characters of the various plants. The *Victoria Regia*; the ferns, showing all their minute fructification; the mignonette; and the orchids, are among the numerous instances deserving of the highest praise. The small groups and single flowers are also very elaborate imitations of nature, and present a beautiful appearance; the colouring, texture, and mechanical finish being of the first class.

PAROISSIEN, A., Paris (France, 945, p. 1225), Honourable Mention, for a collection of waxed leaves, prepared with considerable attention to accuracy in the imitation of nature.

PERROT, PETIT, and Co., Paris (France, 952, p. 1225), Prize Medal, for artificial flowers, feathers, &c. Bouquets and wreaths, composed of various materials; the feather flowers are very beautiful; and the whole collection, including the feather ornaments, is very excellent and affords an evidence of much taste on the part of these Exhibitors, whose productions hold a high rank in the French Department.

RANDOLPH, WILHELMINA, Marsham Street (Class XXIX., 66, p. 792), Prize Medal, for plants imitated in undyed feathers. This collection displays much ingenuity and industry. The field to which the maker has restricted herself is somewhat narrow; probably from the difficulty of obtaining brilliantly-coloured feathers; but so far as her attempt extends, she has succeeded remarkably well in representing the natural characters both of flowers and foliage. The roses, carnations, and wall flowers are highly creditable.

RUSSEL, VINCENT, Lisbon (Portugal, 1295, p. 1318). Honourable Mention, for an artificial orange-tree. A

very creditable imitation of a small orange-tree, distinguished by more than common truth of general character.

SANTA CLARA (Funchal), The NUNNERY of (Portugal), Prize Medal, for a case of feather flowers from Madeira, in the Portuguese Department. A very beautiful specimen of this manufacture, which is extensively pursued in Madeira.

STRICKLAND, MARIA, New Bond Street (Class XXIX., 63, p. 792), Prize Medal, for a collection of wax flowers. The flowers of this collection deserve the highest praise for their artistic merits. They are exceedingly accurate in form, colour, and texture; in which latter respect a group of roses may be especially noticed, an uncommon amount of delicacy having been attained in the petals. A bunch of heaths is equally good. The model of the *Victoria Regia*, in its various stages of development, is excellent and most life-like.

SUGDEN, BORRAS, and Co., Aldermanbury (Class XXIX., 62, p. 792), Prize Medal, for artificial flowers, feathers, and head-dresses. The flowers in this collection are especially worthy of notice, as being very superior commercial products for general use. Much ingenuity is displayed in the imitation of textures by various materials, such as waxed cloth, velvet, muslin, cambric, &c., and for general accuracy of form and colour, brilliancy of tint, and tasteful selection of subject, they merit strong praise. The feathers are also exceedingly good.

TILMAN, —, Paris (France, 698, p. 1212), Prize Medal, for artificial flowers, head-dresses, &c.; small groups, bouquets, &c., in great variety, of very superior quality as intended for general commercial purposes, combining a fair amount of natural character with good mechanical execution, and much taste in the selection and grouping of the component leaves and flowers. The collection of this exhibitor is one of the best contributed by the French flower-makers.

## II. TAXIDERMY.

The art of stuffing animals is generally supposed to be an invention of modern date, and to have originated about the period when the various museums of Natural History were founded in Europe. But traces of the art are to be discovered in the earliest records of antiquity, although the methods then employed differ much from those now practised. The procedure of the ancient Egyptians in embalming human remains and dead animals, in some measure resembles the manipulations of the taxidermist, inasmuch as in both the parts peculiarly subject to decomposition are removed and replaced by more durable materials. But whilst the Egyptian embalmer desired rather to preserve the substance of the body than its form, the taxidermist sacrifices all, except the skin, to the obtaining of a natural representation of the aspect of the living animal. The ancient Greeks and Romans, however, endeavoured to preserve the form as well as the substance of the body, but their methods fulfilled the object very imperfectly. The ordinary proceeding consisted in immersion in melted wax, or in honey; this necessarily disguised the shape, even though it remained unimpaired. Perhaps the best of the ancient methods for the preservation of animal substances consisted in placing them in a solution of common salt; this is still done, though for very different purposes. In this manner the sow, which by bringing forth a litter of thirty pigs, afforded a happy omen to Aeneas, was preserved by the priests; and it kept so well that it was said to have been in existence at Lavinium in the time of Varro. In the same way were preserved two hippocentaur (probably monstrous births), and also an ape, which, having been sent by the Indians to the Emperor Constantine, happened to die on the road.

It appears to have been the business of the priests to preserve rare animals, or rare natural specimens generally, and this was so prevalent, that we are almost tempted to refer the origin of museums of Natural History to the temples of antiquity; indeed Beckmann, in his *History of Inventions*, quotes a number of instances which support

this view. And although it cannot be positively\* asserted, from the notices in the Greek and Latin authors on the subject under review, that methods resembling those now used by the animal-stuffer were employed by the ancients; still the circumstance that animals were frequently suspended in the temples, shows that they were not invariably preserved in salt or honey. The ancients must consequently have possessed methods of preserving animal substances in the dry state; but they appear to have been ill adapted to the purpose, for the head of the celebrated Calydonian boar, which Pausanias saw in one of the temples of Greece, had evidently suffered by time, or the ravages of insects, and had lost the greater part of its bristles.

The art of preserving animals appears to have been but little, if at all, practised during the middle ages; for we only now and then meet with a notice of natural objects being kept as curiosities in the treasures of emperors, kings, and princes. It is only in the records of the period when the study of natural science was resuscitated that passages are to be met with indicative of a knowledge of taxidermy. Sportsmen had undoubtedly practised it much earlier, in a rough manner,† for the purpose of making effigies of call-birds, in the absence of the living bird, while they imitated the note of the bird with their own voice, or some artificial contrivance.

The first records of collections of objects of natural history relate to the second half of the sixteenth century, and it appears from them that such museums existed chiefly in Italy, in relation to which the name of Francesco Calceolari deserves especial mention (Verona, 1584). These collections, which were commenced by private individuals from purely scientific motives, increased in number and importance in the seventeenth century. This period gave birth to the collection of the Tradescants (father and son), which was purchased in 1659, by Elias Ashmole, who presented it in 1683 to the University of Oxford, and thus founded the Ashmolean Museum; and also to the collection of James Petiver, which was much enriched by Sir Hans Sloane, and, on the death of this distinguished naturalist, became the nucleus of the British Museum. It is from this epoch, in which the majority of continental collections took their origin, that the art of preserving skins must be dated; and from the moment it became subservient to science, it kept pace with the growth and requirements of these institutions.

It is a point of extreme interest to compare the admirable productions in taxidermy contributed to the Great Exhibition, with the old specimens of the art of animal-stuffing to be met with here and there in the museums of natural history. Nothing more dissimilar can be imagined; for while the successful productions of modern times pre-

sent Nature to our eyes, and show that the artist has closely studied her hidden secrets, the animals of the old stuffers resemble anything but that which they are intended to represent. It would appear that the study of nature was not deemed to be essential, and that imagination took its place, and was allowed great latitude in the putting up of the stuffed effigies; so much so, that the living prototype would have recoiled in horror from the contemplation of its defunct representative.

The older taxidermists had, evidently, to direct their entire attention to overcoming the difficulties presented by the material, the preservation of which was the main point. At first they contented themselves with removing the intestines and the brain, especially in birds; they attempted to prevent the putrefaction in the remaining parts, by exposing the bodies to a gradually increasing temperature for the purpose of expelling all the water. But however carefully the drying was attended to, it is evident that these productions were of an ephemeral character, as they presented a tempting bait to many descriptions of insects. An improvement was next effected by removing the large fleshy muscles, the entire skeleton still remaining. At present, the skin alone is employed; all parts that rapidly undergo putrefaction being carefully removed. By this means, and by the aid of modern chemistry, which has yielded a series of useful preparations to the taxidermist, the putrefaction of the stuffed animals was prevented. The operator was consequently enabled to direct his attention to other points of great importance; and from the moment he was freed from anxiety respecting the preservation of his subject, he strove to perfect his mode of representing nature, and thus completely altered the range of his art. The skin of the animal has now become, in the hands of the taxidermist, a crude material to be endowed with form, and life-like attributes, as the marble under the chisel and mallet of the sculptor; and unless, like him, he prepares his mind by anatomical studies, and a close observation of nature, he will surely fail to realise a satisfactory production. The Works of Art exhibited—for to many of the specimens the term may be well applied—prove that animal-stuffing has been cultivated with unequivocal success in this direction.

#### UNITED STATES OF AMERICA.

The exhibitors are two in number, one of whom sends a black-eyed squirrel, and the other a case of animals, birds, and fishes; but neither of these contributions calls for especial notice.

#### BELGIUM.

The contribution, which comprises a case of stuffed birds indigenous to Belgium, and also a case of stuffed foreign birds, requires no especial notice.

#### BRITISH COLONIES.

*British Guiana.*—Mr. A. F. RIDGWAY, British Guiana (160-61, p. 987), exhibits a case of stuffed birds, comprising:—the toucan, blue parrot from Essequibo, and the yellow-bellied Trojan. *Nova Scotia.*—Mr. A. DOWNES (p. 974) contributes some well-prepared specimens of birds from that colony. *New Zealand* (37, p. 1002) sends specimens of insects. *South Africa.*—Captain FADDY, R.A. (Western (for South) Africa, 19, p. 954), exhibits specimens of the hartebeest, the striped koodoo, and the waterboc, from the Cape of Good Hope. The manner in which these have been preserved and set up cannot be commended; but it is alleged that the two last-named animals are the first of their kind that have reached this country; and if so, they are of interest. *Van Diemen's Land.*—Mr. F. COX (280, p. 997) exhibits a case of Tasmanian insects; and Mr. BONNEY (281, p. 997) one of Tasmanian birds, which are interesting specimens. Mr. W. H. INCE, of Chelsea (349, p. 1000), exhibits a case of birds formerly belonging to the late Captain J. M. R. INCE, who died at Hong-Kong whilst commanding H.M.S. "Pilot." They formed part of the rare and interesting specimens of Natural History collected by that officer when Lieutenant of H.M.S. "Fly," during the survey of the Great Barrier Reef and Coasts of Australia. These

\* In one of the *Epistles* of Horace (*Epist. lib. I., Epist. 2, l. 63*), addressed to Lollius, a passage is met with, which has been generally construed into a knowledge of Taxidermy among the ancients. The words are—

Venaticus, ex quo  
Tempore cervinam pellem latravit in aula  
Militat in silvis catulus.

Many interpret *pellis cervina* as a stuffed stag, placed in the hall, and barked at by the dog. This explanation assumes that the ancients decorated their halls in such manner; like a modern hunting-box. The passage is, however, intelligible if we translate *pellis cervina* as the mere skin of the stag.

† Although the foregoing sketch suffices to show that the art of taxidermy can only have been very gradually developed, still it will not be inappropriate to introduce in this place the often told, but improbable, anecdote of a rich gentleman of London named Lever, who is said to have possessed a valuable collection of living birds. These all died in one night, owing to the stove used in the aviary having cracked, and the vapours suffocating them. The intensity of Mr. Lever's grief at the loss of his favourites induced him to make an effort at preserving their dead bodies, and he is said to have succeeded in this by the aid of his physician, who invented animal stuffing for the occasion. These birds are reported to have given rise to the Leverian Museum; specimens from which may yet be met with in the British Museum.

specimens are of great interest,\* not only from their number (forty-two) and the beauty of the examples, but also from the evidence they afford of the cultivation of science by the officers of the British Navy. *Western Africa*.—HER GRACE THE DUCHESS OF SUTHERLAND (16, p. 954) exhibits a case of birds from the river Niger.

## FRANCE.

It is much to be regretted that no contribution has come from France. The attention and the chemical and scientific research bestowed upon this art by French naturalists, Bécœur of Metz, the inventor of the metallic soap,\* Fontenelle, Dufresne, and others, and the value of their writings is well known to naturalists; and it would have been interesting to compare the present condition of the art in that country, with the progress which has been made elsewhere.

## SARDINIA.

The only contribution is an elk from the Zoological Museum at Turin. This specimen is most remarkable. It exhibits to perfection the art of representing the living animal, not only in its general form and character, but marking also the fine and delicate undulations of the flesh and muscles, and all the anatomical details which are externally traceable. The difficulty of effecting this is so great that generally it is scarcely attempted; but in the present instance the artist has been most successful. The process adopted by Sig. COMA (83, p. 1305), the exhibitor of this specimen, has been that of modelling the animal in clay, and from that model forming a mould; this mould enabled him to construct a figure of a material resembling papier-maché, retaining all the fidelity of the original model; upon this figure the skin is stretched.

## UNITED KINGDOM.

The number of British exhibitors is thirteen. Of these the following deserve especial notice. A. D. BARTLETT (291, p. 817) exhibits an ingenious example of the art in the constructed figure of the Dodo—a bird which was once a native of Mauritius, and found there in considerable numbers at the beginning of the last century—but now, as far as is known, entirely extinct. The drawings of Savary, preserved in the Belvedere at Vienna, and in the Royal Gallery at Berlin, and some remains of a skeleton formerly in the collection, already alluded to, of Elias Ashmole, consisting now but of the head and one foot—are the data from which the figure has been compiled.\* The process is of course very different from that of preserving a real animal, the skeleton and skin of which are entire: an artificial body has to be constructed, and then covered, feather by feather, with such plumage as is most in accordance with our knowledge of the bird. This has been very skilfully executed; and the result, by the testimony of Mr. Strickland, and of Mr. Gray, of the British Museum, “represents with great accuracy the form, dimensions, and the colour of the Dodo, as far as these characteristics can be ascertained from the evidences which exist,” whilst it “does great credit to Mr. Bartlett's skill, and to his practical acquaintance with the structure of birds.”

There are other specimens exhibited by Mr. Bartlett, which are, perhaps, more attractive, inasmuch as they represent nature with a fidelity of which all can judge.

## \* BECŒUR'S ARSENICAL SOAP.

|                                       |   |   |   |            |
|---------------------------------------|---|---|---|------------|
| Camphor                               | — | — | — | 5 ounces.  |
| Arsenic (arsenious acid), in powder   | — | — | — | 2 pounds.  |
| Curd Soap                             | — | — | — | 2 pounds.  |
| Salts of tartar (carbonate of potash) | — | — | — | 12 ounces. |
| Lime, in powder                       | — | — | — | 4 ounces.  |

The soap is first cut in small slices, and melted gradually with water over a slow fire, stirring all the time. When melted, the salts of tartar and lime are added and well mixed. The mass is then taken from the fire, and the arsenic triturated with it in a mortar; and, lastly, the camphor is added, after having been separately triturated to powder with the aid of a little spirit of wine. The mixture has the consistence of stiff flour-paste.—*The Art of Taxidermy*, by Peter Boswell, p. 2.

The pair of Impeyan Pheasants, entitled “*Courship*,” and the Sleeping Orang-outan, “*Repose*,” are especially deserving of notice. The fleshy parts of the latter have been very skilfully treated; and the dried and shrivelled appearance which they so often assume is entirely avoided.

The skeleton of the orang-outan has been preserved, and also the viscera; the whole furnishing an example of the manner in which rare specimens should be dealt with, in order to secure accurate information to the naturalist, and to promote the advancement of science.

J. A. HANCOCK, of Newcastle (320, p. 818), exhibits, in the North Transept, some beautiful examples, not only of a faithful and spirited adherence to life and nature, but of a skilful and harmonious combination of forms and colours. The three illustrations of Hawking, and the scene in the Tropics, will go far towards raising the art of taxidermy to a level with other arts which have hitherto held higher pretensions. The first of the three objects, illustrating the ancient sport of falconry, is the Hooded Hawk, looking lean and hungry, with the strap attached to his leg, by which he is held on the falconer's fist. In the second group, the falcon has struck to the ground, and is in combat with the *Quarry*, a powerful heron, who is struggling in vain against the attacks of his enemy; whilst the eel, which, but for the interposition of the hawk, would have been soon devoured by the heron, is quietly making his escape. The third tableau exhibits the gorged falcon: what a contrast is here presented! the blood-thirsty enemy of the heron is scarcely to be recognized in the drowsy figure: standing on one foot, the other being drawn up under his breast, the eye half closed, he is the very image of gluttony. The tropical group comprises cockatoos and parrots, sporting in a rich tropical vegetation, glittering (perhaps too much so) with brilliant butterflies and beetles, lizards, and other reptiles. The stolid, heavy, self-satisfied expression of the parrots is well brought out by comparison with the anxiety and trepidation of the Mate of the Dead Gull, in another group; or, with the restless gaze of the Lämmergeyer of the Alps. The contrast between life and death is also well kept up, by the display of a group of dead game, the ruffled state of the feathers being exceedingly truthful.

C. GORDON (202, p. 801) exhibits a representation of an owl “mobbed by small birds,” in which the action of the owl and of his tormentors is given with great liveliness and fidelity.

Dr. BEEVOY, of Newark (204, p. 801), exhibits a dog, prepared much in the same way as the elk contributed from Sardinia, and although not included in the awards hereafter to be enumerated, it is deserving of favourable notice.

J. LEADBEATER (221, p. 801) exhibits a curious and instructive collection of Indian gallinaceous birds; and an extensive collection of humming-birds, comprising about 300 or 400 varieties, in the North Transept, which are very carefully set up.

T. M. WILLIAMS and J. GARDNER (219 and 223, p. 801) exhibit a brilliant assemblage of richly-plumaged birds from various parts of the world. The productions of these artists are apparently of a class rather for the drawing room than the cabinet of the naturalist. They have selected chiefly those denizens of the air most distinguished for the brilliant colouring of their plumage. So far as the careful preservation of the plumage is concerned, they deserve commendation, but in respect to a delineation of the habits of the birds by appropriate scenery, they fall short of the excellencies attainable in this art.

## WURTEMBERG.

The collection of H. PLOUQUET, Wurtemberg (107, p. 1120) consists of, 1st. A series of scenes taken from Kaulbach's illustrations of the well-known German story of Reynard the Fox (*Reineke Fuchs*), and executed with great skill. In these the exhibitor does not of course claim the merit of conception; but the humour with which the design of the artist is carried out, and the expression thrown not only into the attitude, but into the countenance of each animal, is admirable.

2nd. Groups of birds and small animals in action, designed as well as executed by the exhibitor. Some of these also are humorous, and show considerable ingenuity, as, for instance:—a love-scene, illustrated by weasels; a parting-scene between a cat and a polecat; a literary polecat, &c. Others represent the movements or habits of birds in the care of their nests or of their young; the appearance of the broods at different ages, and the action of the parent birds in defending them against attacks from other animals. All are remarkable for spirited and life-like execution.

3rd. The representation of two large hunting scenes, such as form the subjects of *Snyders'* pictures: one, an attack of dogs upon a wild boar; the other, a stag pulled down by hounds. These evince great spirit, and a close study of nature; although, in one or two instances, the action of the limbs and muscles are not minutely correct. These inaccuracies, however, are so few and so slight, that they cannot detract from the very great merit which belongs to the whole of *M. Plouquet's* exhibition. The process employed by *M. Plouquet* in preparing some of his smaller specimens, has been to mould the figure of the animal in plaster-of-Paris, and to stretch the skin upon the model; and it has been most successful. The groups of *M. Plouquet* attract by far the largest share of public attention.

There are twenty-six exhibitors of taxidermy, of these there are:—

|                                    |  |
|------------------------------------|--|
| 4 Holders of a Prize Medal.        |  |
| 1 Who obtained Honourable Mention. |  |
| 21 Unrewarded.                     |  |
| 26 Total.                          |  |

The classification, according to the various countries, is as follows:—

|                           |    |

#### LIST OF AWARDS.

**BARTLETT, A. D.**, Great College Street, Camden Town (Class XXIX., 291, p. 817). Prize Medal for a model of the dodo, and several excellent examples in the higher branches of taxidermy.

**COMBA, F.**, Turin (Sardinia, 83, p. 1305). Prize Medal for a stuffed elk, exquisitely modelled.

**GORDON, C.**, Museum, Dover (Class XXIX., 202, p. 801). Honourable Mention for a group of stuffed British birds.

**HANCOCK, J.**, Newcastle (Class XXIX., 320, p. 818). Prize Medal for several single specimens and groups of stuffed birds and animals, most truthful as to the representation of the habits and appearance of these creatures; and in every respect of the highest merit.

**PLOUQUET, H.**, Stuttgart (Wurtemberg, 107, p. 1120). Prize Medal for several humorous groups of stuffed animals; groups illustrative of the habits of birds; and two large hunting pieces.

### C. ARTICLES CONNECTED WITH EDUCATION.

#### I. EDUCATIONAL MODELS.

There is perhaps no subject more deserving of the attention of enlightened persons, nor any means more conducive to the intellectual and physical advancement of a people, than the dissemination of accurate practical know-

ledge among all its classes; and it is one of the most gratifying circumstances of the present age to find many philanthropic individuals endeavouring to smooth the path to knowledge for those whose position in society does not permit of their engaging in a long course of study.

Beyond the mere rudiments of education, no branch of learning is more valuable to the working classes than applied physics and mechanics; and in those departments there are no means better calculated to impress the mind of the student with the great unchangeable laws of nature, and with the construction of the mechanical contrivances by which man renders them available for his wants, than working-models. Under ordinary circumstances, however, these useful aids are unobtainable by the majority of students, on account of their expense. In order to remove as far as possible this impediment, *Edward Cowper*, Professor of Manufacturing Art and Machinery at King's College, London, has contrived a series of cheap models to illustrate his courses of lectures, with the view of stimulating his students to imitate them, in consequence of their extreme simplicity. Finding that they fully answered their intended purpose, he has since allowed them to be copied by the Society for the Promotion of Christian Knowledge, for the purpose of their introduction into National-schools. The Society is thus enabled to supply them at a few pence only above their prime cost; and at the same time it also furnishes pamphlets explanatory of the various parts of each model and their functions, so that the teacher may readily acquire and easily impart a knowledge of the subject they are intended to illustrate. For example, a sectional-model of "the working-parts of a steam-engine," 20 inches by 10 inches, is furnished for 7s. 6d. All the parts are moveable, and the name of each is indicated by a printed label pasted on it; as cylinder, piston, piston-rod, connecting-rod, crank, fly-wheel, valve-box, slide-valve, steam going into the cylinder, steam going out of the cylinder, &c. It would be impossible to estimate how many of the millions of visitors to the Great Exhibition there are who would be thankful for the information obtainable in the North-East Gallery from this and similar rough but valuable models.

Besides the model of a steam-engine, the following are also exhibited:—An orrery, or stellarium, price 10s., showing the revolutions of the earth round the sun, and of the moon round the earth; also the rotation of the earth on its axis, the inclination of the axis to the orbit, illustrating the cause of the seasons and the inclination of the orbit of the moon to that of the earth. A working section of a pump, 24 inches by 10 inches, price 7s. 6d.; a six-inch sphere, for showing the phases of the moon, 2s.; a box of cubes, bricks, &c., for teaching tangible arithmetic, 8s. 6d.; a series of measuring-rods of 1 foot, 2 feet, and 6 feet in length, at 2d., 4d., and 6d. each; specimens of levers, also a scale-beam and steel-yard, 3d. each; a loom for weaving tapes, garters, &c., 7s. 6d.; a door-lock, 20 inches square, 7s. 6d. The only exhibitor of educational models which have come under the consideration of this Jury, is

**Professor EDWARD COWPER**, Kensington Park Villas (Class XXIX., 245, p. 802), to whom a Prize Medal is awarded.

#### II. ETHNOGRAPHICAL MODELS.

Under this title will be described a few collections of small figures illustrative of foreign costumes and manners, which have come under the notice of the Jury of Class XXIX., although they were arranged as belonging to Class XXX. These, apart from their excellence as works of art, possess a very high interest, as conveying, through the eye, a vivid representation of the customs, occupations, and habits of the natives of distant countries, not so easily apprehended from any written description, however well illustrated by drawings. These models are confined to the Court of the Fine Arts, with the Maltese, the Indian, and the Spanish Courts. Those contained in the first-named department attract by far the largest share of public attention; although in respect of the particular excellence which is here contemplated, they possess, perhaps, less interest than the very diversified and most

extensive series in the Indian Court. It is to be feared that this latter collection will be dispersed with the other splendid contents of the department, before its value can be fully appreciated.
